Frequency modulation was a war casualty, along with commercial (as opposed to experimental) television. There were 4 commercial FM stations licensed, but their operations in some measure were curtailed for the duration, since additional receiving sets were not available. There were 14 international shortwave stations in operation, with government plans under way for increase of the total to 36. Commercial television stations licensed totalled 8, with 17 experimental visual transmitters authorized.

Radio's chief sources of advertising revenue were foods, drugs (including soaps and similar housekeepers' supplies) and tobacco. These commodities represented about 75% of the total income of the national networks. The broadcasting industry continued its steady growth in 1942, though local advertising suffered because of depleted store inventories.

National and regional advertisers, with few products to sell, in most instances continued their campaigns along institutional or "brand name" lines, looking to the post-war era. A trend toward reduction of length of network programs, developed during the year, with most of the one-hour nighttime features cut to one-half hour.

While a moratorium was declared on new or improved station facilities, occasioned by wartime freezes, the battle begun in 194 between government and industry over regulation of the major networks continued throughout the year.

Most radical change in program structure during the year was the introduction of war effort programs on all networks and stations. It is estimated that about 25% of station hours were donated for these programs and recruiting drives, with the total time valued at $64,000,000 at commercial rates.

Revenue and Finance.—During 1941 (1942 figures were not available), the broadcasting industry maintained its consistent pace of increasing business from year to year, with an increase of approximately 13% ahead of the preceding year's level. This was at a slightly lower rate than in 1940, when time sales rose about 19% over the preceding year. Prior to all discounts, the advertising revenue of the industry was divided as shown in Table I.

Table I.—*Radio Advertising Revenue, 1941 and 1940*

	1941	1940
Major and regional network advertising revenue	$82,373,607	$73,789,011
National "spot" advertising*	45,681,959	37,140,444
Local advertising†	51,697,651	44,756,792
Total	$179,753,217	$155,686,247

*Advertising by nationwide distributors placed over individual stations (as opposed to chain, or network, advertising).

†Advertising placed by local advertisers over the individual stations in their market area.

Compilations of "net revenues" by the Federal Communications commission showed the same relative degree of growth (net revenue means revenue from which all discounts and similar trade inducements have been subtracted). The outlook for 1942 business, however, was not as good from the net standpoint becau increased overhead, government free programming and tax hedules. The industry's 1941 balance sheet as computed by the CC is shown in Table II.

Table II.—*Revenue and Expenses of Radio Industry in 1941*

	1941	Pct. change over 1940
tation revenue:		
Sale of time to major and regional chains	$32,092,590	+16
Sale of time to national spot advertisers	45,681,959	+23
Sale of time to local advertisers	51,697,651	+16
Total sale of station time	$129,472,200	+18
etwork revenue:		
Revenue retained after paying affiliated stations	$48,618,843	+ 8
Total industry time sales	$178,091,043	+15
educt commission to advertising agencies	24,501,946	+17
Total industry net time sales	$153,589,097	+15
Incidental revenue	15,190,335	+15
Total net industry revenues	$168,779,432	+15
xpenses:		
Total deductions	$123,940,406	+ 9
roadcast Service Income (Total Revenue in Excess of Expenses)	$44,839,026	+35

The figures quoted above are all from the official records of Federal Communications commission, based on income statents supplied by the major networks and practically all of the ndard broadcast stations. Trade estimates, dealing in gross ings, which are projected from the one-time rates of stations l networks, are substantially higher. For example, the 1941 de estimate of total business reached $237,600,000, as against 7,956,000 for the preceding calendar year. Of this aggregate, 6,900,000 represented national and regional network sales and 0,700,000 spot and local income for 1941. Preliminary trade mates for the 1942 calendar year indicated a major network ss of approximately $115,000,000 and national spot and local iness of $140,000,000. While national advertising in newsers and magazines generally appeared to have dipped somet in 1942, radio increased its volume by about 10%. Radio ntained an almost unbroken record of increased volume after commercial advent in 1926. Only in 1933 did it show a drop—about $4,000,000 below the preceding year.

etwork revenue was dependent largely upon brand name adising in highly competitive fields. These billings were contrated largely in the convenience goods field, such as articles in small units by a multiplicity of retail outlets for a small e and which were purchased frequently by consumers. Goods his type represented nearly 85% of the 1941 network volume probably equaled that percentage in 1942. Institutional paigns, however, were introduced by many accounts which longer were in a position to promote multiple sales, because vartime freezes and rationing. (*See* also ADVERTISING.)

rofit.—During 1941 (1942 figures were not available as of 1, 1943), 784 of the nation's stations showed an excess of nue over expenses totaling $33,438,118. This was an average 42,650 per station.

he entire roster of 817 standard broadcast stations showed ating profits, along with the networks, with a broadcast serv-ncome (excess of broadcast revenues over expenses) of $44,-026. As against these earnings, the 1941 official statistics aled that 174 showed losses of $553,440, or an average of 80 per station. This showed a decided improvement over the eding year when 184 stations lost about $1,000,000 more, or verage of $8,300 per unit. For 1942, these figures were exed to increase appreciably, since many small stations in local kets reported losses.

reaking down the excess-revenue-over-expenses tabulations for 1941, these official figures appear:

U.S. SOLDIER, near St. Paul's cathedral, broadcasting his impressions of the bombed city of London over the British Broadcasting Company network in 1942

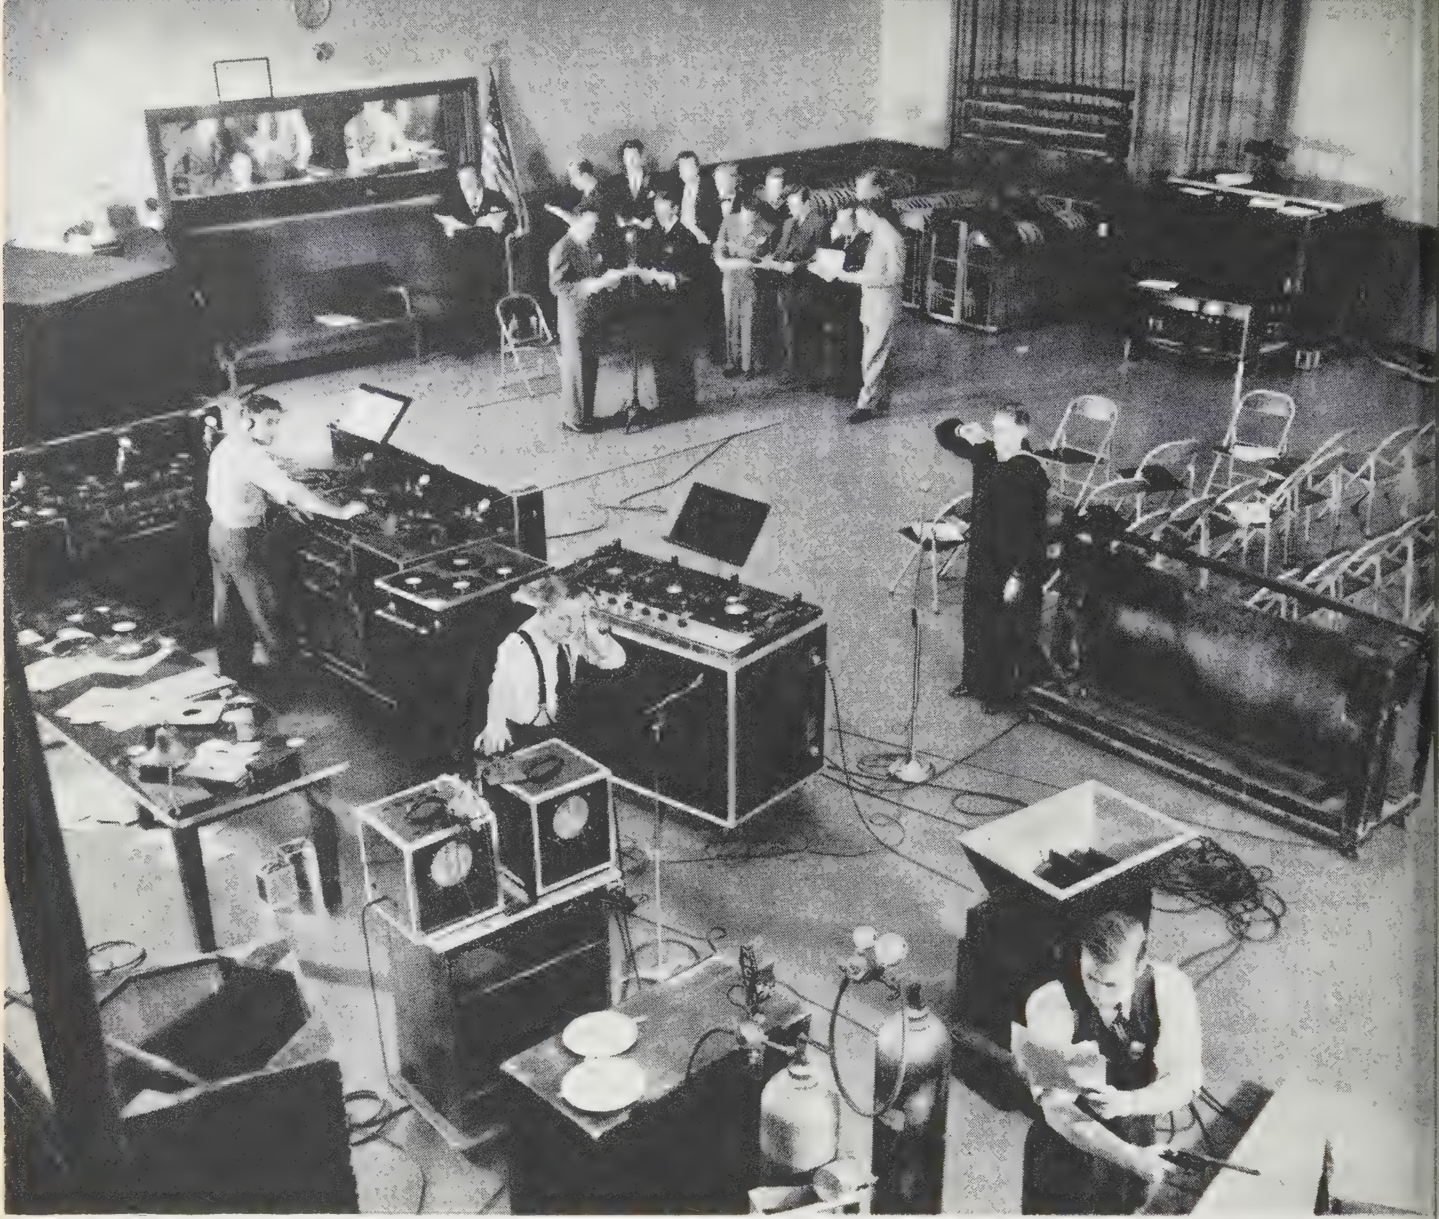
	Excess of revenue over expenses
Networks	$11,400,908
33 network-operated stations	6,381,956
784 other stations	27,056,162
Total	$44,839,026

Total expenses of the broadcasting industry increased approximately $10,000,000 in 1941, the figure reaching $168,779,432. Total excess revenues increased in about like ratio—from $33,-296,708 in 1940 to $44,839,026 in 1941. Expenses for 1942, it was estimated, were destined to wipe out that gain and then some, because of generally increased overhead.

The 177 stations which lost money in 1941 had total investments of $7,780,500, or an average of $43,958 per station. Many of these "losers" had been licensed during the preceding two years, when the FCC took the lid off any local station authorizations. Of this total, 115 stations were located in communities having no other radio outlets. Of the aggregate, about 50 had shown losses since 1938.

The problem of losing stations became serious during mid-1941, when local business tapered off sharply. These stations get little or no national advertising, by virtue of no network affiliation. It was reported the records would show an estimated 300 stations in red ink at the end of 1942. Means of encouraging national advertisers to use the stations were being pondered by the Federal Communications commission (which has no direct authority over station business) and the Office of War Information, whose function it is to keep the public uniformly appraised of the wartime economy.

Industry Assets.—The tangible property of the entire broadcasting industry in 1941 had a composition as shown in Table III.



AN OUTSTANDING RADIO PROGRAM OF 1942 was "This Is War," written by famous authors and broadcast over all four major U.S. networks. Extensive sound effects were used

Programming.—*Network Commercial Programs.*—The ten most popular network programs as of Dec. 1 were[1]:

1942

1. Chase & Sanborn Program (Edgar Bergen)
2. Fibber McGee & Molly
3. Jack Benny
4. Bob Hope
5. Kraft Music Hall
6. Lux Radio Theatre
7. Red Skelton
8. Maxwell House Coffee Time
9. Aldrich Family
10. Kay Kyser

1941

1. Chase & Sanborn Program (Edgar Bergen)
2. Jack Benny
3. Fibber McGee & Molly
4. Lux Radio Theatre
5. Aldrich Family
6. Bob Hope
7. Maxwell House Coffee Time
8. Walter Winchell
9. Kate Smith Hour
10. {Fitch Bandwagon
Kraft Music Hall

Whereas changes in network programming during the previous several years had been negligible, 1942 showed several definite trends, stemming largely from wartime operation. War effort programs immediately vaulted into the forefront of all network and station operations. Individual government departments an agencies spontaneously began development of program feature clearing them through the Office of War Information, which established an elaborate radio branch for funneling of governme programs. The networks themselves, to keep the people arouse inspired and informed, engaged in unprecedented war progra developmental work on the home front, with literally thousand of war broadcasts covering 100 different major subjects aire during the year. More than half of these programs were sustainin

There developed considerable controversy during the year abou so-called "soap operas," serial strips which are radio's counterpa of the continued love story. Unrelenting sponsor support of thes programs, however, resulted in their retention for the most par though several series were discontinued during the year.

Whereas in radio's earlier days it drew much of its top talen from the motion pictures, the reverse was true during the previo two or three years. Top-flight radio names hitherto unknown the movies were in 1942 headliners on the screen. Such perso alities as Abbott & Costello (number one box-office attraction 1942), Jack Benny, Bob Hope, Bing Crosby, all were radio sta before they received Hollywood calls.

Network Programs by Types.—The general composition of ne work evening programming is set forth in Table IV.

Talent Costs.—Official data was not compiled covering aggr gate talent costs of network commercial programs. Trade es mates, however, covering the 1941–42 period, were in the vicini

Table III.—*Composition of Tangible Property of Radio Industry in 1941*

	817 stations	Major networks	Regional networks	Total
Original cost	$67,917,706	$9,934,697	$121,960	$77,974,363
Depreciated cost	39,416,993	5,596,815	97,189	45,110,997

Table IV.—*General Composition of Network Evening Programs*

Type of program	1941–42		1940–41	
	No. of programs	% of time on the air	No. of programs	% of time on the air
rama, serial drama	45	31.4	40	28
udience participation	22	14.5	28	21.6
ariety	29	22.6	24	18.9
ommentators, news and talks	19	10.9	14	12.3
opular music	13	12.6	13	11.1
amiliar music	8	5.2	7	4.9
assical, semiclassical music	4	2.8	3	3.2

ata supplied by the Co-operative Analysis of Broadcasting.

$35,000,000 for nighttime programs and $8,000,000 for day- e programs—running somewhat ahead of the preceding year's imates. This was in ratio to increased industry revenues and rating costs, plus the more widespread introduction of union les for performers in the key originating cities. The Federal mmunications commission reported that the total programming enses of the industry in 1940 were $46,712,361, based on cial data submitted by networks and commercial stations.

ndividual Station Programming.—With the United States a -fledged combatant, more and more news periods were sched- d during 1942 over individual stations, supplementing network gets. While music and sports still constituted anchor program icles, straight news programs, commentaries and roundups in- ased perceptibly. Moreover, entry of the Associated Press in radio news field through its subsidiary, PA, tended to enliven s competition. United Press, International News Service and nsradio Press, old-line participants in radio news distribution, stepped up their activities to meet increased demands.

rograms During the War.—Despite the rigours of wartime ration, radio encountered few, if any, censorship difficulties ing its first full year of war. Its record was regarded as short miracle, since the four major networks themselves devoted over 4,000 network hours to broadcasting war effort programs announcements. This was exclusive of the thousands of news news analysis programs almost completely concerned with orting and explaining the progress of the war, on the battle ls, around the globe and on the production fronts at home. did it include thousands of hours of programs labeled as ertainment but which also rendered wartime service in pro- ng troops and workers with entertainment and relaxation.

he radio audience reached an all-time high, because of the lic's appetite for war news and information. On several occa- s President Roosevelt, as the country's number one micro- ne performer, shattered all previous listening levels with 83% he audience. Average listening to all news programs increased n about 27% in 1941 to about 33% in 1942, according to the operative Analysis of Broadcasting.

t the war's outset, one of the greatest concerns of the broad- ing industry was how it would fare under wartime censorship. Jan. 16, 1942, the U.S. Office of Censorship promulgated a time code of practices for broadcasters, providing for volun- rather than mandatory action. The industry was on notice, ever, that mandatory censorship would be invoked if any ous incidents developed. The code was revised once after its ase, but only to point up obvious shortcomings. Army and y censorship restrictions likewise had to be followed by sta- s, but not a single serious untoward incident developed affect- the industry as a whole.

adio v. Government.—*The Network "Monopoly" Case.*— five-year battle of the Federal Communications commission ring the larger networks within the scope of its regulatory hority reposed before the supreme court (Jan. 1943) after elling a tortuous course in the lower courts. The government ended it had ample authority to "break the grip" of such vorks as NBC and CBS over their affiliates, growing out of exclusive affiliation and time-option contracts. These networks claimed the regulations, as written, would mean "sudden death" for them and would result in deterioration of programming operations all down the line, and pave the way for "fly-by-night" program speculators and brokers to enter the field.

Of the major networks, only Mutual held that the proposed regulations were fair and equitable and would result in healthy competition in radio. As the newest of the networks, it stood to gain most from such regulations, opening the field, in essence, to all comers. Since then, however, the Blue Network, formerly operated jointly with the Red Network of NBC, became a separate corporate entity (Jan. 9, 1942) and divorced its operations from those of NBC. The Red Network became known as NBC, with the Blue Network separately incorporated as the Blue Network Co. This was in accord with one of the FCC's "monopoly" regulations, which specified that one organization may not provide more than one program service, obviously aimed at the Red and Blue. Subsequently, NBC abandoned its exclusive affiliation form of contract, thereby in part satisfying another of the commission's eight proposed regulations.

But both NBC and CBS went to the mat on the time option provision, which they insisted was the lifeblood of network radio. After losing out in the lower courts early in 1942 in its effort to enjoin the FCC from making these rules effective, the networks went to the Supreme Court. On June 1 the highest tribunal reversed the statutory three-judge court in New York, holding that it had jurisdiction over the chain-monopoly regulations, and sent the case back for full review on the merits. This was a temporary victory for the old-line networks. Mutual intervened in both proceedings as a friend of the commission.

On Nov. 16, the New York statutory court dismissed the appeals of NBC and CBS for injunctions, a smashing victory for the FCC. The networks then took the case to the supreme court, contending that the commission was without jurisdiction to regulate business practices in broadcasting and that the lower court had erred in making such a finding. The final chapter was expected to be written when the supreme court decides this issue, scheduled to be argued early in 1943.

Irrespective of the outcome of the FCC network litigation, these same networks later must face anti-trust proceedings on virtually the identical issues, filed on Dec. 31, 1941 by the Anti-Trust division of the department of justice. Trial of this proceeding was repeatedly postponed, pending the outcome of the earlier litigation.

Also pending before the Federal District court in Chicago was a $10,000,000 triple-damage suit against RCA, as parent company of NBC, claiming that NBC willfully stifled Mutual's growth. This suit hinged upon the government's anti-trust proceeding. The outcome of all this litigation, geared toward bringing network operations under close government scrutiny and regulation, appeared to be anybody's guess. Several pleas by the networks that a moratorium should be declared for the war's duration were rejected by the FCC and by the department of justice. It appeared certain, however, that final determination would be reached during 1943, unless the administration or congress stepped in.

Other FCC Investigations.—While the FCC did not let up in its effort to terminate what its majority views as domination of the industry by the major networks, it did slow down to a walk on other inquiries and proposed regulatory moves designed to tighten its grip on station ownership and operation. Two investigations which it had launched during 1941, covering (1) the desirability of newspaper ownership of stations, and (2) multiple and absentee ownership of stations, were practically stalemated during the year.

FRANCES LANGFORD singing on the "Command Performance" program broadcast weekly by 13 short-wave stations to U.S. forces throughout the world in 1942. The entire show was made up of requests received from U.S. soldiers, sailors, marines and coast guardsmen stationed outside the country; it was not heard by the U.S. public

The newspaper ownership inquiry, which brought a storm of protest from congress, as well as the industry, was in its final phases, but there was little indication of any conclusive action soon—probably not for the war's duration. The question the commission sought to decide was whether joint control of newspapers and broadcasting stations tended to result in an impairment of radio service and whether regulations should be adopted to force their complete divorcement. Industry opponents took the position at protracted hearings that the question was one for congress and not the commission, and that the commission was without authority to act even if it decided against them. The question was of great importance, since about a third of the country's stations were in 1942 owned by or affiliated with newspapers.

While the commission did not pursue the multiple ownership inquiry, involving ownership of more than one station in the same community by a single person or entity, or absentee ownerships of stations, certain of its members nevertheless disparaged such acquisitions. A number of separations resulted during the year by sale, presumably to head off any commission mandate banning such ownership. Here again, formal action was unlikely for the war's duration.

Board of War Communications.—With the war's advent, broadcasting became a "fourth arm of defense." On Sept. 24, 1940, President Roosevelt created the Defense Communications board to co-ordinate all phases of communications during a "national emergency." Its personnel was made up of the chairman of the Federal Communications commission, the chief signal officer of the army, the director of naval communications, the assistant secretary of state in charge of international communications, and the assistant secretary of the treasury in charge of coast guard operations (absorbed by the navy with the outbreak of the war).

One of the president's first official acts (on Dec. 10, 1941) after the war declaration was to transfer to this board all of his functions and powers over communications vested in him under the Federal Communications act. This board promptly went into action, and, so far as non-military communications were concerned, became a sort of super Communications commission, geared to the war effort. Its name subsequently was changed to the Board of War Communications.

With no staff of its own, this board issued restrictions which were promulgated by the FCC as the operating agency. Many of the FCC's civil functions were curtailed, with the accent on emergency wartime operations. Upon recommendation of this board, regulations governing qualifications of broadcast station technicians and operators were relaxed, due to manpower shortages cropping from the war. New construction also was stopped by order of this board, working in collaboration with the War Production board.

On July 14, the broadcasting industry was declared "essential" under Selective Service requirements, and some degree of protection was afforded against migration of key personnel to the armed forces or other pursuits, the step having been taken upon recommendation of the Board of War Communications. Subsequently, on Oct. 16, 1942, Selective Service defined a score of broadcast occupations as critical. On Dec. 1, standard broadcasting technically went on a full wartime ration, with the enforcement of horizontal power reduction of all stations by one decibel, which was not discernible to the listener, and by relaxation of normal engineering standards.

Musical Property.—Having successfully resisted the effort of the American Society of Composers, Authors & Publishers (ASCAP) to increase licence fee royalties for use of its copyrighted music over the air in 1940, the broadcasting industry moved along without any serious music performance headaches until the summer of 1942, when James C. Petrillo, president of the American Federation of Musicians (34,000 members), banned the making of transcriptions and phonograph records for public performance, on grounds of unfair competition with live musicians. The ban became effective Aug. 1, 1942. After that date no new recordings or transcriptions were made, up to the close of 1942, for radio, automatic coin-operated phonographs (juke boxes), or other public performances.

Although aimed primarily at radio and juke boxes, the Petrillo ban precipitated a national controversy that had repercussions in the courts, congress and in the public prints. Several government agencies, including the Office of War Information, FCC and the Department of Justice, interceded, contending that the war effort would be impeded through non-production of recorded music, so vital in maintenance of morale and in entertainment of troops at home and abroad. Moreover, it was contended that many small radio stations, largely dependent upon recordings and transcriptions for programming, would be forced out of business, along with many taverns and small business establishments which could not hire live talent. As the year ended, Mr. Petrillo, variously

Table V.—*Employment Figures of the U.S. Radio Industry*

	1941	1940
l-time employees	23,666	21,646
rage weekly compensation	$48.10	$46.95
t-time employees	3,978	4,007
rage weekly compensation	$30.86	$27.49

lled as a "czar" and "dictator," had stuck to his guns. A gressional inquiry into the whole matter was scheduled for mid- 1943, with remedial legislation predicted unless the ban was d.

ssistant Attorney General Thurman Arnold brought anti-trust vities against the musicians union, contending violation of Sherman act. The federal district court in Chicago on Oct. 12, ever, dismissed this proceeding as a "labour controversy." whole question then was taken to the supreme court by the rnment, where it awaits argument and decision.

eanwhile, ASCAP enjoyed unusually favourable relations with broadcasting industry, after its bitter fight which resulted in rious drop in its receipts during 1941. New contracts entered with the major networks and most of the broadcasting sta- s run until 1948, with the industry paying about half, per- agewise, of what ASCAP sought in the way of royalties.

nployment.—With an average weekly wage for its nearly oo full-time employees of $48.10, the broadcasting industry ntained its standard of high compensation. The average kly payroll (for the week of Oct. 12, 1941) was $1,138,249, ncrease of $121,883 over 1940. The average weekly wage $1.15 over 1940. Latest data, made available by the Federal munications commission, is shown in Table V.

adio had its manpower problems galore during 1942, but er few national union difficulties, save for the musicians con- ersy, still raging as the year ended. With the war's drain on manpower, which has been a "young man's game," more more women entered radio service, both in the technical and ophone ends. Women technicians, quickly trained at special- schools, entered service by the score. And women announcers over regular microphone duties, without confining them- s to home economic pursuits.

levision and Frequency Modulation.—These fields, before war's onset, were looked upon as radio's new twin bonanza. ng 1941, the government paved the way for their commercial lopment, with the allocation of set bands of frequencies for services, and the setting up of rules for commercial opera- providing for sponsorship, both local and national, on the basis as standard broadcasting. The technical progress of two arts is discussed elsewhere in this article and in TELE- ON.

e war, with immediate shortages in all types of electronic pment, froze development of these two arts without necessity overnment edict. All radio receiving set and transmitter ufacturing plants were converted to 100% war production, ping new civil radio development dead in its tracks.

e FCC subsequently found it expedient to relax its regula- regarding minimum operating schedules for both television FM, and cut down appreciably the fidelity requirements of transmission. These were only temporary expedients, how- , and, once the war was won, both services were destined for n periods.

hile television and FM service continued under commer- regulations, actually both services were perforce on experi- tal schedules. There were not enough receivers either for FM elevision in use to warrant extensive purchase of time by rtisers. It was estimated roughly that there were 500,000 sets in use, largely in the east.

Within the radio laboratories, many revolutionary electronics developments were taking place during 1942, practically all of them geared toward waging of modern warfare. Rigid secrecy was being maintained, because of the war.

Radio In the Western Hemisphere.—In March 1941, radio listeners all over the continent changed their dial settings for their favourite stations. The North American Regional Broadcasting agreement, providing for a redistribution of broadcast facilities among the North American nations, became effective March 29. General improvement in service resulted, with less interference evident and with most of the renegade Mexican border stations eliminated. Canadian broadcasting, always geared closely to operations in the United States, continued to show overall improvement, and worked harmoniously with the government in the war effort. Mexican and Cuban broadcasting, as a result of the scientific allocation of facilities, became more stable, with Mexico particularly following the United States formula for program sponsorship and distribution.

Superpower.—Use of power in excess of 50,000 watts for standard broadcast stations in the United States, long a burning issue, was knocked out "for the duration" as one of the FCC's last official acts of 1942. The only station to use so-called superpower—Crosley's W8XO, Cincinnati—was ordered Jan. 1 to terminate its experimental authorization with 500,000 watts, which it used from midnight to 6 A.M. The transmitter was the experimental adjunct of WLW, Cincinnati, and with the FCC's action it appeared the superpower transmitter would be mustered in for psychological warfare, probably to be taken over by the Office of War Information for international shortwave broadcasting or standard band broadcasting from a location somewhere in Africa, or in England.

While technically power in excess of 50,000 watts was regarded as desirable, political and economic repercussions in previous years resulted in serious controversy, lower wattage stations claiming that they would be driven out of business by virtue of the "national" coverage of the proposed radio behemoths.

U.S.-Latin-American Broadcasts.—A year of global war brought about more radical and far-reaching changes in the international phases of broadcasting than in any other aspect of the industry. Plans launched in 1941 for expansion of domestic broadcasts to the Latin-American fields had to be modified radically, to permit use of the U.S. international transmitters in the psychological warfare effort. Through the Office of War Information,

JEN YING YEN, Chinese journalist, rehearsing his part in "America Speaks to China," a series of eight dramas written by Pearl Buck (right), translated and short-waved to China in 1942

Overseas Branch, and the Office of the Co-ordinator of Inter-American Affairs (Rockefeller committee), all program operations of the nation's international broadcast stations were taken over under lease arrangements, effected Nov. 1, 1942. The licencees, private corporations, relinquished all their program control but were reimbursed for rental of their facilities.

These leases covered the 14 existing international stations. To compete more effectively with axis propaganda broadcasts, plans were made by the government during 1942 to construct 22 additional international shortwave transmitters of power of at least 50,000 watts, calling for an outlay of some $4,400,000 for transmitters alone.

It was specifically provided that, upon the war's ending, these government leases would be terminated, with the transmitters returned to their licencees, which included such companies as NBC, CBS, Crosley, General Electric, Westinghouse, World Wide Broadcasting, and Associated Broadcasters, operators of a standard broadcast station, who at the government's behest installed the 100,000-watt KWID in 1942 in record time. This was to supply sorely-needed counter-propaganda to the Pacific theatre. (*See* also Federal Communications Commission.) (S. Tf.)

Scientific Developments (U.S.).—The year 1942 witnessed an intensive step-up in scientific and industrial activity in the field of radio, under the imperative prod of wartime needs. Such activity for the military and naval forces began with the conversion of plant facilities, formerly used for the annual production of hundreds of thousands of home broadcast receivers, to the manufacture of standard communication apparatus for war uses. From that relatively elementary step, the new work extended into far-flung fields of design and research, in which phenomena strange to the average pre-war radio engineer were turned to unforeseen uses as "secret weapons." Little could be said about any of this, except to echo the already announced facts that really astounding progress in the generation of high-intensity ultra-frequency radio power and in the invention of new forms of sharply-beamed antenna structures made possible direction-finding and range-determination apparatus of almost unbelievable precision and importance. These new instruments might be used not only like old-fashioned direction-finders, to fix the location of enemy radio transmitting stations which are caught in the act of sending messages, but also to locate bodies that are unusual in their environment, such as aeroplanes in flight or ships at sea, under conditions of distance or atmospheric obscurity which would make their detection by optical means impossible.

Even the most simple field of radio communication was expanded and improved in striking fashion, doubtless in part because of the obvious fact that in World War II, where "fronts" were often 50 mi. or more in depth, and where the whole active field might be overrun with tanks and under constant aerial bombardment, communication could not be maintained by wire lines alone. The added burden thus thrown upon radio communication apparatus, together with the added importance of swiftly delivering graphic material (such as photographs and maps) from point to point, naturally gave impetus to the development of new and special applications of the older forms of signalling, including code telegraphy, telephony and facsimile. In the air forces and at sea, where wire-line communication was of course not merely difficult or intermittent but impossible, the newer uses of radio were all the more essential. (*See* also Federal Communications Commission; War Communications, Board of.) (J. V. L. H.)

Great Britain.—The year 1942 saw the tenth anniversary of British overseas broadcasting, which became during the war the most extensive part of the British Broadcasting corporation's work. The "V" campaign so caught the imagination of the occupied countries that radio propaganda found itself in advance of military possibilities. After that, the mysterious "Colonel Britton" suggested, with precise details, an insidious form of passive sabotage such as the "Go Slow" movement with its sign of the snai, and gave hints for hindering transport. There followed a succession of warnings to the population in coastal areas in the occupied countries to cease to travel by night or to leave the distric altogether.

Meanwhile, listening went on, and increased, despite the German efforts at jamming. A new service of messages in Morse to most of the occupied countries was introduced, giving the essenc of the news and talks in a form which no jamming could stop.

"Black listening," as the Germans term it, did not stop at the helots of the "New Order"; Germans themselves, including the army, formed the habit, as various appeals from the Goebbel propaganda machine and numerous savage sentences in the court proved, while in the occupied countries, and notably Poland, BBC bulletins continued to form the basis of the "underground" newspapers which circulated everywhere in spite of every effort to suppress them.

But though this European service was of primary importance as the BBC's aggressive weapon of political warfare, it formed only a small part of the corporation's work. The empire service in English, now ten years old, covered the globe, at appropriat listening times for each audience, for over 21 hours a day. Ther was also a supplementary service for the non-English tongues of the empire—such as Afrikaans and Bengali, Maltese and Tamil. Altogether, 11 fresh tongues were added in 1942 to the oversea services, and broadcasts were given regularly in 45 languages not including English, Welsh and Gaelic. An important addition was the introduction of bulletins originating in the United States and rebroadcast over the BBC in English, German, French Finnish and Italian.

The close radio co-operation between Britain and the new world became increasingly evident after the bombing of Pear Harbor when a great development took place in the rebroadcasting of BBC news and programs by the chief networks of the United States. Moreover, the Columbia Broadcasting system brought an eminent radio producer, Norman Corwin, to Britain He, working with BBC facilities, was responsible for a program series which was well received by United States listeners—"An American in Britain." The BBC's own series, "Britain to America," in the hands of Laurence Gilliam, was also widely rebroadcast. By the autumn of 1942 every news broadcast or talk put out by the BBC at weekends was rebroadcast somewhere in the United States.

Reciprocally, listeners in Britain heard a steadily increasing number of programs built in the New York studios by the BBC while special program items were introduced for the United States troops stationed in Britain.

Throughout the year broadcasting also increased in all the great dominions, in India—a very special service—and in the crown colonies, while the local radio stations of Central and South America made growing use of the BBC Latin-American service rebroadcasting news bulletins, talks, music and drama.

Of more domestic interest was the resignation of the director-general, F. W. Ogilvie, and the appointment of two joint directors-general, Sir Cecil Graves and Robert Foot. A notable development of corporation policy was the decision to ban "emasculated music," while the appointment of Arthur Bliss as music directo was a reflection of the public's growing desire for more vigorou music of the lighter kind, and also for music formerly regarded as far too serious for the generality. Russian music, of the traditional kind, and also in its more modern expressions, notabl Shostakovich's "Leningrad Symphony," proved especially popular while the Promenade concerts in London had never before had n large and enthusiastic audiences either on the spot or over radio.

lso significant was the enthusiastic reaction to three other grams—"Marching On," "Radio Reconnaissance" and "The ins Trust." Listener research—and the interest of the news-ers—showed the last to be the most consistently popular es of programs ever produced by the BBC. Another indica- of the attitude of the British people in war was the popularity he religious services.

inally, two other developments stood out—the increase in twave services for troops in the middle east, and the con-ed development of the daily schools broadcast. Nearly 12,000 ols had, by the end of 1942, incorporated, as an integral part he educational system, these broadcasts, that dealt with no ow technical subjects, but aimed at giving the child a liberal cation and making him, or her, a citizen of the world. (*See* ADVERTISING.)

diology.

Radioactive Isotopes.—During 1942 by far the greater part of the output of radioactive materials duced by the cyclotrons in the U.S. was diverted to various tary research projects. It was possible to continue a small unt of therapy with radioactive phosphorus, in patients with aemia or lymphosarcoma who had been shown to be bene- previously, but no new projects were reported. Neutron apy was practically discontinued. Tracer and metabolic ies, however, requiring only small amounts of the radioactive opes, were carried on in several institutions. It is impossible eview these in detail, or even to mention more than a few nem.

ith radioactive phosphorus, distribution and elimination in nal persons and patients with leucaemia were studied in detail. phosphorus apparently passes from the acid-soluble com-nt of the white blood cells, through enzymatic carrier sys- to the nucleoproteins and phospholipides. If high phosphorus entration in these cells is desired in therapy, the material ld be injected intravenously.

ood studies with radioactive iron were fruitful. In pregnancy absorption of iron is from two to ten times normal; in ses in which iron stores are known to be abundant (per-ous anaemia, etc.) absorption is less than normal; chronic tion shows no utilization of radio-iron, and leucaemia and cythaemia but little. It is believed that the *reserve stores* on in the body, rather than anaemia, control iron absorption. ethods for determining the volume of the circulating blood devised, based on the injection into the blood stream of which have been made to take up some radioactive material; phosphorus and possibly other elements have been found ticable.

y means of radioactive sodium, the transfer of sodium across entas of animals was studied, for different species. The rate ransfer increases throughout gestation, until just before de-y, when it drops sharply. Correlation was established between veight of the foetus, its rate of growth and the sodium supply. all such tracer studies, it was assumed that possible effects ne radiation emitted by the very small amounts of radioactive erial employed could be ignored. In the case of radio-phos-us this was shown to be not always the case. The administra- of very small doses (subtherapeutic) to leucaemia patients followed by large shifts in the organic acid-soluble phosphorus ion of the white blood cells; such shifts did not follow the inistration of normal phosphorus. The total body radiation the tracer dose was calculated to be of the order of 3 to 15 valent roentgens. Irradiation of the entire body, or of the ulating blood (through a small cone over the heart), with X-ray doses of this magnitude produced similar shifts in the blood phosphorus.

In view of the number of individuals working with or in the vicinity of cyclotrons, the matter of their safety from radiation damage is important. Monthly blood studies of 85 such individuals in two institutions were carried on for over two years. Some transitory radiation effects were demonstrated, when exposures were known to have occurred. A few individuals were found who appeared to be especially sensitive; these were advised to change their occupations. In general, protection by these installations appeared adequate.

Radium.

Mining operations in Belgian Congo were reported to have been stopped when the refinery at Oolen, Belgium, fell into the hands of the Germans; some 1,200 short tons of ore was shipped to the United States in 1940, presumably stocks on hand, as none had been reported in 1941, and no information was received as to the recovery of the radium content of the 1940 imports. The Eldorado mine, in the Northwest Territory of Canada, the world's second largest source, was closed during 1941, due to a heavy accumulation of untreated ore, but was reopened early in 1942. The refinery at Port Hope, Ont., remained in operation. Due to current conditions, the agreement between the Belgian and Canadian producers, dividing world markets on a 60:40 basis, was dissolved in 1941.

There is a small recovery of radium from ores mined primarily for uranium and vanadium; all told, slightly over 3 grams was recovered in 1941, and a total of 4-6 grams was expected in 1942. Imports of radium salts into the United States dropped from 30.311 grams in 1940 to 4.063 grams in the first nine months of 1941, all from Canada.

Railroad Retirement Act: *see* SOCIAL SECURITY.

Railroads.

In the United States the 1942 record of railroad performance, in meeting the heavy and exacting demands of war conditions, reflected credit on railroad management, the governmental regulating authorities and the shipping and travelling public. The volume of traffic, both passenger and freight, was greater than in any previous year. The freight performance was free from car shortage, congestion, or unreasonable delay, but in passenger service there was overcrowding of regular trains, as well as restrictions on extra trains. There was a governmental ban on conventions and other large gatherings requiring train travel and prohibition of special trains to sports and like events. The "on time" performance of regular trains was considerably below normal. The relatively poor record in passenger service was explained by the fact that in addition to the increased travel of civilians the heavy demands by the military services at times utilized 40% of all sleeping cars and 15% of all coaches. During the latter part of 1942 the railroads carried monthly about 1,750,000 men in the armed services moving under orders. The total for the year was about 12,000,000, not including the very large number of uniformed men who made trips while on furlough or travelled under orders in parties of less than

Table I.—*Traffic Units of U.S. Railroads*
(in thousands of millions)

Item	1918	1929	1932	1941	1942
Revenue ton-miles	405.4	417.3	234.0	475.1	630.0
Revenue passenger-miles	42.7	31.0	17.0	29.4	53.0

Table II.—*Units of Equipment of U.S. Railroads on January 1*

Item	1918	1929	1932	1942
Locomotives	61,890	59,470	55,149	41,759
R. R.-owned passenger train cars	52,977	53,097	50,747	37,897
R. R.-owned freight cars (thousands)	2,302	2,298	2,230	1,725

50. The shortage in locomotives and cars, the inability to acquire new equipment, and the overloading of trains meant that some sacrifice in the quality, adequacy and comfort of service for civilian passengers was inevitable, but the sacrifice was generally borne without complaint.

An indication of the degree of increase in freight and passenger traffic of Class I railroads is given in Table I which shows the number of tons and passengers moved one mile in 1942 (partially estimated), compared with the number moved in 1918, the last year of World War I; 1929, the peak of predepression prosperity; 1932, when the depth of the depression was reached; and 1941, when the national defense program was in full swing.

The most striking feature in the comparison is that the record-breaking performance of 1942 was made with substantially less units of equipment than in the earlier years. The increase of 41% in ton-miles in 1942 over 1929 was made with 25% fewer freight cars, and the increase of 71% in passenger-miles was accomplished with 29% fewer passenger train cars.

The ability of the railroads to carry the larger 1942 load with a smaller inventory of equipment was due (1) to improvements in the design and capacity of locomotives and rolling stock, (2) to betterments in terminals, track structures and signalling, (3) to advances in the technique of terminal and line operation, and (4) to co-operation of shippers and receivers of freight in the more effective utilization of freight cars. Because of substantial increases in train load and train speed, the net ton-miles per freight-train hour in the first 10 months of 1942 were 16,216. The comparable figure for the same period in 1929 was 10,654. In freight-car performance, the car-miles per car-day in 1942 were 49. This may be compared with 34 in 1929. The car-loads in the two years were 31.5 and 26.9 tons respectively. The inclusive unit—net ton-miles per freight-car day—was 1,042 in 1942 and 557 in 1929.

The improvement in the utilization of locomotives is reflected in miles per locomotive-day. Freight locomotives in 1942 made a daily mileage of 127.4; in 1929 the daily mileage was 65.6. In passenger service the 1942 figure was 212; in 1929 it was 120. In practically all other units of freight operating efficiency the performance in 1942 was markedly superior to that of previous years.

Apart from the abnormal transportation demands of the war industries and the movement of troops and military equipment and supplies, the burden on the railroads was augmented by the effect of enemy submarines along the Atlantic seaboard and the shortage in gasoline and rubber. The sinking of many oil tanke and the diversion of others to the navy and overseas servi placed on the railroads the responsibility of meeting the needs the Atlantic coast states by moving oil in tank cars. During th latter part of the year the railroads carried as much as 850,00 bbl. daily—oil which formerly had moved by water. The closin of the Panama canal to commercial vessels caused the diversio to rails of the substantial intercoastal traffic which previously ha moved by water through the canal. The rationing of gasoline an the difficulty in renewing worn tires, as well as the inability t purchase new equipment, handicapped the trucks, busses and pr vate automobiles, and a large part of their tonnage and passenge sought the railroads.

Table III.—*Condensed Income Account—Class I Railroads*
(in millions)

Item	1929	1941	1942*
Operating revenues	$6,270	$5,347	$7,439
Operating expenses	4,506	3,664	4,578
Taxes	397	547	1,076
Net Ry. operating income	1,252	998	1,500
Net income after fixed and contingent charges	897	500	950

*1942 partially estimated.

The creditable railroad record of 1942 was attributable in pa to the constructive administration of the Office of Defense Tran portation. That office was created by executive order in De 1941 to co-ordinate the transportation policies and activities o the several federal agencies and modes of transportation. Be tween Director Joseph B. Eastman and the railroads there wa effective co-operation, and many of the steps taken to conserv transportation effort and insure the more efficient utilization o equipment were due to Eastman's initiative and support.

Nor would the railroads have been able satisfactorily to per form their heavy task in freight service had they not had a hig degree of co-operation on the part of shipper organizations an individuals in the heavier loading of cars and in the reduction i time ordinarily taken in loading and unloading.

The greater volume of traffic, together with a moderate in crease in rates authorized in March by the Interstate Commerc commission to offset wage increases late in 1941, resulted in earn ings, both gross and net, greater than in any earlier year.

Under normal conditions an increase in railroad traffic approach ing the capacity of available equipment would have been met b the purchase of additional locomotives and cars. In 1942, how ever (and in 1941 as well), priority regulation of critical ma terials prevented the railroads from augmenting their equipmen inventory. They were unable to secure the approval of the Wa Production board for all of the materials necessary and conse quently received only a part of the needed equipment. Prioritie also interfered seriously with the normal programs of rail re newals, other important items in physical maintenance, and heav repairs to and renewals of equipment.

Legislative activities affecting transportation in 1942 wer small in scope. An act placing freight forwarders under regula tion by the ICC was signed by the president in May, and i October the so-called Chandler act of earlier years, providing fo voluntary financial reorganization of railroads by negotiation between the railroad and the bondholders, was re-enacted.

Little progress was made in completing the reorganization o railroads in the hands of receivers or trustees. The mileage in th hands of the courts at the beginning of the year was 69,859. A the end of the year it was 66,092. Two Class I roads emerge from receivership and one was added. The higher earnings o 1941 and 1942 caused renewed litigation by stockholders wh would, under the proposed plans, have their equities extinguishe

The process of abandonment of unprofitable railroad branc lines was given impetus by pressure from the War Productio board in the interest of recovering rail and other scrap materia The abandonments authorized by the ICC during the year ha an aggregate of approximately 2,516 mi. of line, the highest o record.

uring the year to carry supplies to Russia

were concerned. A considerable mileage was renewed, a pro-
on of it with American rolled rails, and, in conformity with
sh practice of using longer lengths than the American 39 ft.,
or even three 39 ft. rails were welded together. Drainage
improved, new ballast laid down and new ties inserted: re-
l programs either of track or equipment were not, however,
the normal peacetime standard.

e outstanding problem had been to operate the railways with
luced staff, since a large proportion were serving with the
d forces, and yet carry the unexampled war load of added,
usually urgent, freight traffic in addition to the heavy passen-
oad. Expressed briefly, with a reduction in passenger train
ge, by some estimated at roughly 30%, and a ton-mileage
probably well above all prewar records, the four British
ays and the London Passenger Transport board had so far
d it possible to meet all the demands placed on them by the

crowded, the position was eased by the withdrawal of dining
thereby giving additional seating accommodation on the
s concerned, and by the reduction of sleeping car services.
y categories of cheap tickets were withdrawn in Oct. 1942,
hroughout the year the slogan "Is your journey really neces-
" helped to limit passenger travel which tended to grow as
restrictions on the use of private automobiles grew more
e and as long distance coach services were suppressed.
reas the lessened incidence of air attacks helped the situa-
the increasing need for fuel, gasoline, and then rubber saving
d to aggravate it. To some extent the problem of staff was
ome by the employment of about 100,000 women, on the
ons, in the offices, locomotive depots and shops, but it was
open to the British railways to increase their total staff as
proving possible in the United States.

ontinental Europe.—It is not desirable to refer to technical
opments in Britain, but this restriction does not apply to
nental Europe. Neutral countries were few in number, but
pain the recently established state railway system, primarily
ed by the Norte, the M.Z.A. and the Andalusia-Western
was occupied mainly with its own formation into one entity, and with overcoming the arrears of civil war damage aggravated by a shortage of fuel, locomotives and equipment. Main-line electrification north of Madrid made but slow progress.

In Switzerland the benefits of electrification, through the domestic production of power supply, were well demonstrated. Steam locomotives, held in reserve, had to be despatched to Germany to haul coal and other stores to Switzerland. Steady progress was made with the widening to double track of the last few single line sections on the Gotthard route which formed one of the most vital supply arteries of the axis powers, linking Germany and Italy, since the latter was receiving about 12,000,000 tons of coal from the former per annum, a large proportion of which had to pass over the Gotthard and the Simplon routes.

In Sweden conversion to electric traction continued in the south and electric traction became continuous from Trelleborg, ferry for Sassnitz in Germany, to Riksgransen, Norwegian frontier near Narvik, as a result of the completion of the Langsele-Boden section: a throughout distance of 1,260 mi., probably the longest continuous stretch of electrified main line in any country in the world. The Norwegian Nordland line was at work to the north of Mo. Except for the western tip of Turkey the rest of Europe was temporarily German-occupied territory, or Germany itself, and, therefore, railway communications and their working lay under the control of the German minister of transport; in which case the military needs were paramount.

It could be safely assumed that no construction work was being undertaken unless it was considered essential for the German war effort; indeed, the whole German war effort, owing to the shortage of motor fuel and tires coupled with the virtual elimination of shipping except in coastal waters or on inland waterways, was dependent on the successful functioning of the European railway system under German control. To make the best use of the facilities available an energetic policy was being followed aimed (1) at obtaining the maximum use of every unit of equipment through better loading and quicker turn-round, (2) diverting to inland waterways much traffic of a nonperishable nature, at any rate in months when navigation was open, (3) reducing cross-hauls by the zoning of supplies (a policy earlier and more effectively organized in Britain). During summer months, with fewer blackout hours and good weather conditions, the transport position eased visibly after the crucial and exceptionally cold winter, but the

1942 MOHAWK TYPE freight locomotive

strain was likely to reach almost breaking point early in 1943.

As the German forces advanced into the U.S.S.R. the 5 ft. gauge Russian lines were converted to the standard 4 ft. 8½ in. gauge, and to operate these supply lines locomotives had to be withdrawn from all over Germany—during the summer of 1942 it became known that locomotives from other countries such as France and Belgium were being requisitioned in important numbers for work further east. The only 5 ft. gauge lines existing in German controlled areas were those in Finland, and it was likely that a use had been found for captured Russian equipment in that area. In many parts the repair of war damage to the railways was a prime necessity for the axis occupying forces, and little information was naturally available but it could be assumed that nearly all the Belgian, French and Dutch lines were available again by early 1942. The task was heavier in the Balkans, and it was not until March that the Salonika to Athens section was reopened, two large bridges being involved. In July the single rail link joining Istanbul and Adrianople to Central Europe was reopened, but certain bridges over the Danube in Yugoslavia were understood to be still incomplete. In Rumania, as the battle area moved eastward, certain main lines became vital and several important widening schemes were completed. Railway construction in Bulgaria aimed at linking up the newly acquired ex-Greek and Yugoslav territories.

Italian endeavour was largely concentrated on the conversion to electric traction, an important section completed in 1942 being that from Trento (Brenner pass) to Bologna. Some progress was being made in France with the conversion to electric traction of the Brive-Montauban line, long under way, and preparatory work was in hand on the Paris-Dijon section of the main line to Marseilles, but shortage of materials and fuel slowed up all major works. No important developments were reported in Belgium, but in Holland, electrification of the Utrecht-Hilversum-Amersfoort passenger services could be recorded.

Asia.—Feverish activity was reported on the Yunnan-Burm railway link as a supply route to China early in 1942, but lat developments brought the scheme temporarily to a stop. Railwa mileage in Malaya and the Dutch East Indies was in Japane hands and damage had been repaired; they also controlled th railway systems of Indo-China and Siam, as well as the Burm railways. Doubtless links were being constructed between is lated sections but there was no reliable information. In Japa itself an event of importance was the opening of electric servic through the new tunnel between Shimonoseki on the mainland ar Moji on Kyushu island, thus reducing the schedule between Toky and Nagasaki to 24 hours. News was lacking of railway develo ments in China.

Turkish railway construction proceeded in Asia Minor; bo Britain and Germany supplied the Turkish state railways wi locomotive power and equipment. The standard gauge rail link Syria between the Palestine railways and the Turkish railway sy tem was continuing rapidly; published statements showed that was already complete between Haifa and Beirut. For variou standard gauge lines in the middle east American 2-8-2 type loc motives were supplied, constructed in the record time of 3 month The traffic capabilities of the Trans-Iranian route to the U.S.S. were increased by the construction of the Ahwaz-Khorramsha branch, thus giving alternative port facilities in the Persian gul In India record traffics resulted in excellent financial returns, b inability to import new motive power and equipment gave cau for some concern. The latest railways to be taken over by th government were the Bengal and North Western and the Rohi kund and Kumaon.

Africa.—Construction continued of the Mediterranean-Nig railway, a new name for the long projected trans-Sahara projec Eventually designed to link up with the Dakar-Niger railway sy tem, the Bou Arfa-Colomb Béchar section of standard gauge l was opened and construction was continuing southwards, permi ting development of the Kenadza coalfields. Extensions eas ls were also being made to the Dakar-Bamako line, and, in 1942, a bridge was opened over the Niger to be used to iect French Guinea and the Ivory Coast with the Mediteran-Niger. Press references were made to the strategic rail- built westwards from Mersa Matruh to the vicinity of ruk.

he South African railways and harbours administration had to lle record traffics and large equipment programs were re- ed to cope efficiently with it. The rapid development of the vays' workshops as equipment building centres, in addition to r war activities, was the outstanding feature of the situation, full advantage was taken of increased receipts to strengthen place on a sound foundation the financial structure of this railway system, whose weekly gross revenues attained the ,000 mark.

outh America.—In Argentina the four most difficult prob- were the shortage of fuel supplies, the large stocks of cereals and which could not be exported, the inability to import h-needed new locomotives and equipment and the insolvency he railway pensions fund, on a national basis. To ease the named, locomotives were converted to oil-burning and some e was used as fuel. Grain export, which affects railway rev- s materially, depended on the supply of ocean tonnage; the motive situation was eased by the lowering of speeds, reduc- of services and greater reliance on Argentina's own repair facilities. Development of the Victoria-Minas railway, as a lt of U.S.-Brazilian agreement, was of vital significance in rd to ore supply for the United Nations.

onstruction was continuing on the Salta railway link to Anto- sta, and on the Chilean side must have nearly reached the ntine border; the Argentine section would not be finished 1945. The Chilean railways were faced with many difficulties freight rates and passenger fares were materially increased in. 1942.

Peru the Arica-Tacna railway, dating back to 1857, was n over by the government.

ustralia.—The various Australian government railways, in in the war zone, handled vastly increased traffics with lim- production facilities for locomotives and equipment. The blem was not eased by the existence of three different gauges by the necessity of utilizing railway workshops for other war vities. Construction work was limited to that required for purposes and the growing restriction on road services im- d a further traffic burden on the railways, as did the diver- from coastal shipping. Close co-operation between the indi- al state railways was an outstanding feature. In almost every 1941–42 yielded record traffic figures, as also records in ating efficiency, in spite of the release of large numbers of to the armed forces. In New Zealand the financial year 1–42 resulted in record receipts, in part created by the diver- from road transport, but also due to the government's policy ail and road co-ordination.

anada.—The two large Canadian systems were called upon andle record traffics, on certain sections reaching double the var volume. The C.N.R. installed one of the longest C.T.C. allations in the world on its Maritime Provinces main line. system of rates known as "agreed charges," which originated ritain, made headway even under war conditions, simplifying ounting and clerical work. Rationing.

Consumer rationing began in the United States in 1942, to meet shortages in supplies of certain civilian goods needed for, or curtailed by, the war program. The legal basis for rationing had already been laid in 1941, beginning with the Priorities and Allocations act of May 31, 1941, which stated that, in the case of shortages, "the president may allocate such material in such manner and to such extent as he shall deem necessary . . . in the public interest. . . ."

The president delegated this authority to the Office of Production Management (OPM), subject to the approval of the Supply, Priorities and Allocations Board (SPAB), and transferred the Division of Civilian Supply from the Office of Price Administration (OPA) to the OPM to "formulate plans and programs providing for the equitable distribution . . . of the materials . . . for civilian use." The director of priorities (OPM), then Donald M. Nelson, was made responsible for preparing and issuing priority programs, which included rationing.

One of the first and most vital commodities affected by the Japanese attack in the Pacific was rubber, 97% of the world's supply being produced in the area of the southwestern Pacific, and rapidly being cut off by the advance of the Japanese armed forces. Luckily, the United States had been foresighted enough to build up stocks of this vital war and civilian material, and about a normal year's supply was on hand or afloat. However, new war demands and the probability of having to depend on this stockpile for two or three years made it necessary to curtail civilian consumption immediately. Tires accounted for about 75% of the country's consumption of rubber, and three days after the war began, all civilian sales of tires were "frozen."

Some 8,000,000 tires, at all distributive levels, were thus made available for rationing (manufacture of civilian tires was stopped). The OPA, because of its established regional price administrating organization and consumer interest, was considered the best agency to administer rationing. The amount of tires to be rationed was so small that only vital community needs could be

ULTIMATE EFFECT of U.S. gasoline and tire rationing as predicted in 1942 by Shoemaker of *The Chicago Daily News*

THE IRONIES OF U.S. SUGAR RATIONING in 1942 as seen by Goldberg of the *New York Sun* in this cartoon captioned "Sugar Shortage"

considered. On Dec. 27, 1941, the OPM issued M-15-c, a detailed ration order, directing the OPA to ration tires by certificates through local boards (at least one to every county) to qualified eligibles, such as physicians, ministers, police, fire services, and operators of buses, farm tractors and trucks used for certain specified purposes. These eligibles were to prove the need of a car in the pursuit of their duties, and the need of a tire to operate the car.

The OPA issued ration order 1 shortly after; printed regulations, instructions and forms; and organized local volunteer Tire Rationing boards after the manner of the Selective Service boards. (On Dec. 1, 1942 these boards, renamed War Price and Rationing boards, numbered 5,500.) Quotas were issued for each board, with state and national quotas to distribute in areas where needs were under-estimated. On Jan. 5, 1942, tires began being rationed to the public.

Closely allied to tires were automobiles. Both the steel and the mechanical skills that went into the making of several million cars each year were badly needed to produce war materials. On Jan. 1, 1942, all sales and deliveries of passenger cars to civilians were "frozen," and the OPM and the OPA began working on a rationing program for this civilian good.

During Jan. 1942 the war administration was streamlined. The OPM was abolished and the War Production board (*q.v.*) was established in its place, free from all of the cross-checks and answerable to no one but the president. One of the first acts of the WPB was to establish the OPA as the rationing administrative agency, empowered to ration at the retail level to consumers such goods and with such added authority as the WPB should thereafter direct. The OPA was given a free hand with respect to the administrative regulations, in order to provide for changes and flexibility in the rationing programs instituted.

This was followed by a directive to ration passenger automobiles, and on Feb. 2, 1942, ration order 2 allowed delivery of all cars sold but not delivered on the date of the "freeze." This done to avoid the inequities arising from the numerous ca where "turn-ins" had already been sold on the second-hand market. Ration order 2A established consumer rationing of au mobiles by certificate through the same local boards with m the same eligibility standards, beginning March 2, 1942.

With the conversion of the typewriter manufacturing plants war work, the OPA was directed to ration another commod which was very important to most businesses. Ration order revised, issued on March 24, 1942 (ration order 4, first issu was a temporary expedient allowing used typewriters to go t highly restricted list of war manufacturers), rationed new a used typewriters by certificates to qualified eligibles showing ne Non-portables could be secured by firms with A-1 or higher r ings, and portables went to firms with A-3 or higher ratings, p a number of other important organizations, such as governm agencies, newspapers, etc. Used non-portables and new portab could be rented by any group until such time as they were cal in. (This date was later set at Sept. 15, 1942 for used n portables.)

The war curtailed the supplies of sugar from the beginni The Philippines and Hawaii were cut off or curtailed as sour of supply, and in the Caribbean, submarine activity and shipp space priorities limited our ability to import sugar. According sugar had to be rationed, and the OPA was called on to adm ister the first comprehensive rationing program. Coupon rati ing, with an equal amount to everyone, was decided upon.

The immense job of printing and distributing 180,000,000 rat books was finally completed by May 6, 1942, with the help the nation's schools and a temporary army of volunteers, a rationing began. The first coupon of the 28 in the War Rat book I was good for one pound of sugar over a period of t weeks. Later the coupon values and length of the periods w adjusted from time to time according to the supply situation.

On May 15, 1942, bicycles began to be rationed by certific to qualified eligibles showing need. The primary purpose of t rationing was to make available this substitute for automobile public transportation to those whose work was vital to the w or the community. On July 9, the qualifications were liberali to speed up the movement of bicycles.

On May 15, 1942, gasoline rationing was begun in 17 east states and the District of Columbia. Tankers had been divert to war uses, causing a shortage on the east coast which the u of rail tank cars, although greatly increased, could not make Rationing was done by the issuance of cards to be punched the filling station attendant when the gasoline was sold. T basic ration was three gallons a week, with additional amou for necessary occupational driving, and unlimited amounts t few drivers whose needs could not be calculated and who w important to the community, such as doctors. As there was check on the seller, violations were very frequent in cases wh the attendant knew the driver.

On July 22, 1942, a new system was inaugurated in the ea rationing gasoline by coupons. The basic ration was four gall a week (later lowered to three), with an additional ration occupational driving up to a maximum of 64 gallons for th months. In addition, a certain number of qualified drivers w allowed extra amounts above that where conditions warrant Filling stations were required to turn in coupons received in or to obtain supplies, thus helping to achieve compliance. Th coupons were distributed in the same manner as were the su coupons.

Farm machinery and equipment became one of the warti casualties under the shortage of steel. Manufacture was shar curtailed, and the OPA was directed to ration supplies to obt e best distribution of available supplies. In this instance, the epartment of agriculture, through its AAA program, was equipped administer the program, and on Sept. 15, 1942, the OPA dele- ated its authority to the secretary of agriculture, who began the tioning of farm machinery according to need and to the extent at it would help production.

Rubber boots and rubber work shoes were rationed to the ublic on Oct. 5, 1942 by certificates through the local boards cording to qualified need. Some types of footwear were dis- ontinued, and the attempt was made through rationing to scale own the use of rubber by issuing lighter weight protective foot- ear where possible. Civilian rubbers, gaiters, etc., which could made almost entirely from reclaimed rubber, were not in- uded in the rationing program.

As the winter of 1942 approached, it became apparent that el oil, along with gasoline, would be a war casualty on the east ast, and even in the midwest. On Oct. 22, a fuel oil rationing ogram became effective in 30 eastern and midwestern states d the District of Columbia. Coupons were issued according to formula which weighted factors such as average degree-day mperatures of the region, floor space, consumption during the evious year, plus special considerations for young children and k persons. An average cut of one-third of the 1941 consump- on was the necessary goal of the program. Considerable diffi- lty was experienced because of the complexity of the formula d the regulations, causing some public resentment.

On Nov. 11, 1942, OPA again delegated authority to the secre- ry of agriculture, under a directive from the WPB, to ration ilk cans and farm fencing.

As in the case of sugar, coffee supplies diminished because of bmarine activity and priority shipments. As the stocks ran w on retailers' shelves, the OPA was directed to ration coffee. is was done with the sugar ration book, using the last coupons coffee coupons. On Nov. 29, 1942, coffee rationing began, with e initial coupon (No. 27) good for one pound of coffee over a e week period. All consumers, except those under 15 years of e, were included in this program.

During 1942 the rubber situation had grown worse rather than tter. New tires were rationed, but no attempt was made at st to control the use of the biggest stock of rubber in the untry, that on the wheels of the country's automobiles. The ruch report, submitted to the president at the end of the sum- er, recommended immediate mileage rationing to preserve the e of these tires, in order to maintain essential civilian activities. cordingly, on Dec. 1, 1942, after nationwide distribution of soline coupon books in the manner of the second gasoline ration- g program on the east coast, gasoline rationing began through- t the United States. Coupled with it, was a tire-inspection pro- am, providing for a complete periodic check on the nation's es. In addition, all tires over five per car were required to be rned in to the government as a stockpile or scrap rubber.

The last ration program of the year was the certificate ration- g of coal and oil stoves to consumers on the proof of need. It gan on Dec. 18, 1942. As production was curtailed, it was ared that the fuel oil ration would cause a run on the available pplies.

As the year ended, a new type of rationing was being prepared. ortages of meat were apparent throughout the butcher shops the country, and canned goods, especially processed fruits and getables, were disappearing from the grocers' shelves.

The new type of rationing planned to handle this was point tioning. Under this plan, an entire group of similar products ere to be rationed, with a coupon price set on each individual em, allowing the consumer to spend his points as he chose among e rationed articles. On Dec. 27, it was announced that processed fruits and vegetables were to be rationed Mar. 1, 1943, and meats shortly thereafter. (*See* also BUSINESS REVIEW; PRICE ADMINISTRATION, OFFICE OF.) (L. HN.)

Rayon and Other Synthetic Fibres.

With a 1942 production the highest in history, the rayon yarn industry of the world went through 12 months of accelerated introduction into many new fields of both military and civilian use. The total production of rayon filament yarn and rayon staple fibre in the United States was 10% larger in 1942 than in 1941. The increase in filament yarn was 6% greater and the staple fibre 25% greater. Consumption of staple fibre alone in 1942 of domestic (U.S.) origin represented an increase of 9% over the 1941 combined figures of domestic production and imports.

Comparative figures of rayon production in the United States are given in Table I for the period 1937–42 inclusive. Table II shows the relative position of rayon with that of other principal textile fibres.

In other countries as well, rayon took a prominent position. In France, according to official reports, a new rayon producing company was formed during the spring of 1942 known as France Rayonne, through which the German staple fibre and rayon producers cartel took control of the French industry. Germany was to supply all of the cellulose raw material to France. An adjunct of this development was the formation of a separate company to exploit the bullrush growth in Provence alleged to contain 97% of alpha cellulose. The German cartel was reported to control 33% of the venture.

Rayon, in Great Britain, came under new government control with the introduction of so-called utility cloths, or the only cloths in which rayon could be used. In July 1942 the British Standards Institution in order BS/BOT 23, issued specifications for 16 groups of cloths in all acetate, all viscose, all cuprammonium, acetate warp, viscose filling, spun rayon and filament, etc. Details of the specifications were type of cloth, use (lingerie, linings, etc.), threads in warp and filling, weave, finish and requirements as to fastness to washing, degree of fading and fastness to perspiration. The variety of fabrics that might be produced from a limited range of yarns was commented upon favourably by British manufacturers. Altogether, 56 constructions were stipulated. The British Rayon council and the Rayon and Silk association adopted, in 1942, a standard trade terminology for rayon as follows:

Rayon yarn: Continuous filament rayon yarn.
Rayon fabrics: Fabrics made from rayon yarn.
Rayon waste: Waste from rayon yarn.
Rayon staple: Rayon staple fibre.
Spun rayon yarn: Yarns spun from rayon staple.
Spun rayon fabrics: Fabrics made from spun rayon yarn.
Spun rayon waste: Waste from rayon staple and from spun rayon yarn.

In the United States market, 1942 saw many new military uses for the synthetic fibres, the most notable the rayon tire cord. In Oct. 1942 the United States government issued orders for five rayon producers to convert their yarn production to

Table I.—*United States Rayon Production in Millions of Pounds*

*11 months actual, one month estimated.

that suitable for tire fabric. The order was expected to increase the output of the high tenacity type of rayon needed from 50,000,000 to 100,000,000, possibly to 150,000,000 lb. annually. The government expected that one-third of the viscose yarn production of the United States would go to military tires. But this was only part of the huge consumption of rayon and synthetic fibres for war use. The entire output of nylon yarn was allocated to the military, primarily for parachute fabrics known as "escape chutes." The amount produced was a military secret. Vinyon, fortisan and other variations of rayon, such as the substitute for kapok known commercially as bubble-fil, were being employed in a variety of ways in self-sealing gasoline tanks; aerial delivery and cargo chutes; fragmentation bomb chutes; tow targets; life preservers; mosquito netting canopies; flags, insignia, etc.; tapes, lines and webbings; uniform materials for the maritime service, the women's auxiliary services and the parachute troopers; sleeping bags and other windproof fabrics; and life boat fabric.

In the civilian field, rayon was the only fine fibre left to the hosiery makers when nylon was removed from the civilian market in Feb. 1942. The hosiery mills consumed, in 1942, 15% of the viscose yarn shipped, as compared with 8% in 1941. In 1942 former users of silk and wool in fabrics also increased their demands. In all, it was estimated that in 1942, new users took about 25% of the rayon available.

A new source of demand for rayon civilian fabrics made its appearance late in 1942 for the first time and was a potentially major factor for 1943. This was the demand from the North African and other outlying military areas where the lend-lease program would be utilized in rehabilitation of the civilian population as well as in providing a medium of payment for services and goods used by the U.S. forces. Rayon fabrics, because of their versatility both as to price and types, were heavily in demand for shipment to these areas. While purchases made in 1942 were for immediate delivery, it was expected that a long-range program for 1943 would include heavy shipments of rayon for future delivery.

Production of rayon in South America and Mexico also progressed. In April 1942 machinery of a New Jersey rayon yarn producer was dismantled and shipped to Mexico to begin operation around August 1. One of the larger rayon (acetate) producers in the United States was also combining with Mexican interests to construct a new plant at the cost of $6,000,000 which would employ more than 3,000 persons. Chile started operations in 1942 in its new rayon filament yarn plant, making coarse denier sizes of yarn from imported wood pulp. Of historical interest was the decree issued on Aug. 16, 1942, by the Argentine government, making compulsory use of the term "rayon," and prohibiting use of the term "artificial silk." Reconstruction Finance Corporation.

The functions and activities of the Reconstruction Finance corporation were administered in 1942 under the direction and supervision of the secretary of commerce. The RFC has succession until Jan. 22, 1947, unless sooner dissolved by act of congress.

In 1942 the main function of the corporation was the financing of various war activities, such as procurement of materials, construction and operation of war plants, and writing of war damage insurance. Such financing was provided both to private business and to the corporation's own subsidiaries—Defense Plant corporation, Defense Supplies corporation, Metals Reserve Co., Rubber Reserve Co., and War Damage corporation. The corporation was also authorized to make loans to public agencies, financial institutions, insurance companies, railroads, drainage, levee, irrigation and similar districts, mining and fishing industries, public school districts; subscribe for and make loans upon nonassessable stock of banks, trust companies, insurance companies, national mortgage associations, mortgage loan companies; make loans for the carrying and orderly marketing of agricultural commodities and livestock, and exportation of agricultural or other products; and purchase securities from Public Works administration. (C. B. H.)

Reconstruction Finance Corporation—Summary of Activities Feb. 2, 1932, through Dec. 31, 1942

	Authorizations	Disbursements	Repayments and Other Reductions
For benefit of agriculture	$ 2,602,281,430.83	$ 1,450,848,509.84	$ 1,449,453,719.76
To open banks to meet demands of depositors	1,334,805,161.08	1,138,251,619.27	1,086,932,446.99
For distribution to depositors in closed banks	1,419,531,473.07	1,056,570,252.24	1,021,849,899.44
For bank capital (including Export-Import banks $176,500,000, and Federal Home Loan banks $124,741,000)	1,646,046,189.00	1,471,132,831.56	783,712,091.28
For self-liquidating projects (including PWA municipal securities)	1,295,122,465.62	1,069,317,914.15	906,582,243.92
To business enterprises	663,414,534.26	339,386,574.72	215,483,491.23
For loans for national defense and war activities	8,839,576,367.98	5,071,253,010.92	1,934,987,299.03
For loan to Great Britain and Northern Ireland	425,000,000.00	390,000,000.00	30,262,605.43
For purchases of stock—national defense	125,000,000.00	26,000,000.00	
To drainage, levee and irrigation districts	148,662,048.64	99,668,742.35	33,003,471.20
To railroads (including PWA railroad securities)	1,595,476,435.54	1,035,626,714.70	575,187,677.08
For loans to and capital of mortgage loan companies (including $25,000,000 capital the RFC Mortgage company and $11,000,000 capital Federal National Mortgage association)	767,342,930.95	627,269,524.67	393,033,394.72
For loans to and capital of insurance companies	151,527,250.19	137,668,209.81	103,709,493.78
To building and loan associations (including receivers)	178,402,559.59	133,134,867.90	128,463,588.03
To public school authorities	25,674,050.00	23,242,175.00	22,399,400.00
For catastrophe rehabilitation loans	16,184,520.95	12,003,055.32	11,066,565.71
To state funds for insurance of deposits of public moneys	13,087,715.88	13,064,631.18	13,064,631.18
For mining, milling and smelting businesses	19,124,100.00	8,607,909.40	3,362,751.78
For loan to Export-Import bank	25,000,000.00	25,000,000.00	25,000,000.00
For other purposes	669,057.07	614,813.85	614,813.85
Total—By directors of the corporation	$21,291,928,290.65	$14,128,661,356.88	$ 8,738,169,583.81
Allocations and loans to other governmental agencies and for relief by direction of congress	3,724,387,499.75	3,399,503,917.39	2,958,322,941.10*
GRAND TOTAL	$25,016,315,790.40	$17,528,165,274.27	$11,696,492,524.91†

*Includes $2,741,144,685.09 of corporation's notes cancelled pursuant to act of congress, approved Feb. 24, 1938.
†Includes $45,669,005.09 credited on indebtedness for property taken over for debt.

Red Cross.

Entry of the United States into World War II resulted in unprecedented expansion of American Red Cross activities at home and abroad during 1942. More than half of the Red Cross budget was devoted to the U.S. armed forces. At the request of the army and navy, scores of Red Cross clubs for service men were established in the British Isles, Iceland, Australia, New Caledonia and other foreign countries in which U.S. troops were stationed; 461,493 pints of blood were collected from volunteer donors for army-navy blood plasma supplies; 45,648,300 surgical dressings, made by chapter volunteers, were delivered to the armed forces.

Military and civil defense activities at home also increased. Red Cross field directors at army and navy stations and hospitals counselled and assisted 637,585 service men and their families with the co-operation of local chapters; the Red Cross recreation ogram for convalescent patients in military hospitals was oadened; medical case and social workers were recruited to eed the recovery of convalescent service men by relieving eir minds of personal problems and worries; Red Cross first-aid d water safety courses were made available to the army and vy for use in the military training program. The Red Cross o embarked upon a program to enroll 98,000 nurses eligible military service in its first reserve, the reservoir of the army d navy nurse corps.

In the civil defense program, Red Cross first-aid instructors ined and certified 3,616,254 persons. First-aid detachments th 8,287 persons were organized to protect life in factories, ice and store buildings, schools and other public places. To eviate the shortage created by the large number of physicians, rses and medical technicians entering the army and navy, 5,214 persons were trained in Red Cross home nursing. An ditional 30,000 women were enrolled as Red Cross nurse's es, a volunteer corps whose members take over routine nursing ties in hospitals and clinics. Through the Red Cross nutrition vice, need of proper food and diet to cope with wartime conions was stressed with 157,288 women completing an extensive cational course.

Chapters perfected their disaster preparedness organizations in as vulnerable to enemy attack. Under agreements with the ice of Civilian Defense and the Office of Defense Health and lfare Services, the Red Cross assumed responsibility for the ergency mass care of civilians affected by enemy action, inding temporary shelter, feeding and clothing. The number mobile disaster units, made up of trucks, canteens, ambulances l other vehicles was increased, and disaster relief workers in coast chapters took over the task of assisting seamen and sengers of torpedoed vessels.

At a cost of $1,235,295, the Red Cross aided 72,434 victims 174 natural disasters in 42 states. Membership in the Red oss' 3,748 local chapters and more than 6,000 branches inased to 15,129,833 adult and 14,887,792 junior members in 2.

n three years of war more than 20,000,000 people in Europe, rica and Asia had received $60,000,000 worth of assistance ough the American Red Cross foreign war relief program. oroximately $4,000,000 worth of hospital and medical supplies e shipped to Russia; in China 4,245,000 persons were aided an additional $4,000,000 worth of medical and food supplies.

CROSS MOTOR CORPS in a parade of 10,000 uniformed women down Fifth ue, New York city, April 11, 1942

U.S. CIVILIANS donated blood through the Red Cross in 1942 to be used in transfusions on battlefields. A nurse is shown taking the blood pressure of a donor

Food and medicine were sent in large quantities to Greek and Polish refugees in the middle east. Milk concentrates and clothing were sent to the children of unoccupied France; clothing, hospital and medical supplies to the people of Great Britain.

More than 500,000 food parcels were sent to the International Red Cross in Geneva for distribution to prisoners of war in Europe. Food and relief supplies also were shipped to U.S. prisoners of war in the far east; large quantities of Red Cross supplies in Shanghai were saved from confiscation and distributed to imprisoned Americans and citizens of Allied countries.

At home, 2,719,581 volunteers accomplished the following in 1942: produced 96,661,757 surgical dressings and 15,501,512 garments and miscellaneous articles for home and abroad; transcribed into Braille 461,553 pages and duplicated 302,228 pages for distribution to the blind; served meals to 587,291 persons through the canteen corps; 26,604 active members of the motor corps made 552,240 trips, principally in behalf of disabled veterans and crippled children; 11,452 Gray Ladies served in hospitals; home service workers made a total of 110,198 visits in handling cases of enlisted men and their families; 28,812 members of the staff assistants' corps gave their time performing general office work in chapters. (G. S. Br.)

The World.—Rapidly spreading war during 1942 brought corresponding extension of Red Cross activities in the various national Red Cross societies and their two international organizations, the International Red Cross committee and the League of Red Cross Societies.

War in the Pacific and the capture of many prisoners by the Japanese extended the work of the International Red Cross committee to that area. Although Japan had not ratified the convention of Geneva regarding the treatment of prisoners of war, agreement to abide by its terms was given in Jan. 1942 and delegates of the international committee were accepted for Japan proper, Shanghai and Hongkong. The committee's Central Agency for Prisoners of War in Geneva, Switz., continued to serve as a clearing house for information about prisoners of most of the belligerents and its delegates visited prison camps in Europe, the far east, Africa, Australia and at many points in the western hemisphere. These delegates, always neutral and usually of Swiss nationality, observed the treatment of prisoners, talked to the men in private, submitted reports for both the detaining power and the prisoners' own country, and arranged for the distribution of supplementary supplies of food, clothing and comfort articles.

The International Red Cross committee continued to handle an increasing volume of civilian messages and inquiries about persons in war-affected nations, maintaining for the most part the only method of communication between persons in one belligerent country and their friends and relatives in enemy territory. During 1942 the committee also developed an agency for the operation of ships carrying prisoners of war relief supplies and given safe conduct by the belligerents.

The League of Red Cross Societies—the federation of the 63 Red Cross and Red Crescent societies of the world—continued its exchange of information among the societies and its promotion of Red Cross activities by the publication of bulletins in various languages and by visits to societies by the league's experts. The Pan-American bureau of the League of Red Cross Societies sent specialists in disaster relief and nursing services to Latin-American Red Cross societies, assisting in the development of these activities. The Joint Relief commission of the International Red Cross, formed by the league and the international committee, arranged for the extension of relief to civilian war victims and sent delegates to observe the distribution in many of the occupied European countries. (*See* also PRISONERS OF WAR.) (P. E. R.)

Reeves, Jesse Siddall (1872–1942), U.S. educator, was born Jan. 27 in Richmond, Ind. Educated at Kenyon and Amherst colleges, he did graduate work at Williams college and Johns Hopkins university and was admitted to the bar in 1897. He founded the University of Michigan's department of political science, joined the staff of that school in 1910 as professor of political science and in 1931 became professor of American institutions, a post he held until his death. Previously he had taught at Johns Hopkins and at Dartmouth. He served as technical adviser to the American delegation to The Hague conference on codification of international law, was lecturer at the Academy of International Law at The Hague and was a member of the Pan-American commission of jurists for the codification of international law. He died at Ann Arbor, Mich., July 7.

Refugees. The tide of refugee movement was predominantly eastward in Europe during 1942. The most substantial movements were of unknown numbers of civilians in flight before the German armies as they advanced into Russia and of 200,000 to 300,000 Jews deported in the first instance from cities and towns in Germany, Austria and Czechoslovakia to the overcrowded ghettos of Warsaw, Lublin and Lwow in occupied Poland and later from these concentration centres to unknown destinations and obscurity in eastern Europe.

Earlier, more than 1,000,000 Polish refugees were driven from western Poland, which had been incorporated into the German reich, into the Gouvernement General of Poland and into southern and eastern Poland, occupied in the first instance by soviet Russia and later by Germany as her attack on the U.S.S.R. rolled eastward.

To meet the increasing shortage of manpower resulting from the war, Germany recruited labour from all countries in Europe. To the 1,500,000 French war prisoners employed in industry and agriculture in the reich were added those who went voluntarily under contract to Germany from the allied and neutral countries. Larger numbers followed from the occupied countries whose enlistment was forced either by the lack of other employment or by the imposition of repressive measures such as restricted food rations or the threat of imprisonment or internment. It was estimated that foreign labourers in Germany totalled more than 2,000,000 in 1942. Refugees in southern France enlisted for labour in building roads across the desert in North Africa to avoid recruitment for labour in Germany.

Exit westward through the Atlantic ports of Spain and Portugal and through Algiers to Casablanca in Morocco to the western hemisphere was restricted to those central and eastern European and Spanish refugees in southern France, Spain and Portugal who were fortunate enough to secure exit permits from these countries and immigration visas to overseas countries. After the United States and many of the Latin and South American countries entered the war in Dec. 1941 transportation from Lisbon was restricted to occasional sailings of Portuguese and Spanish boats. Less than 10,000 refugees left these ports for places of final destination in 1942.

The westward movement of millions of Chinese war refugees from central and eastern China and the coast cities continued. The movement was not essentially different in character from that of the preceding years. Peasants and unskilled labourers moved short distances along railroads and highways in flight from the Japanese forces to return to their homes when the military action had ceased or the areas were recaptured. The more mobile elements of the Chinese population trekked farther westward participating in the general movement of industry and cultural institutions. Whether the westward movement will prove permanent will depend on many factors involved in the peace settlement at the end of the war, chiefly the organization of the industrial and business economy of China and the strength of its government administration.

Through the arrest and round-up of Jewish refugees in Paris late in July 1942 the world became aware of the persecutions to which the Jewish communities of central and eastern Europe had been subjected earlier at the hands of their German oppressors. Mass deportations which had taken place on a wide scale in the east and had been hidden by nazi censorship were instituted in western Europe where news to the outside world could not so easily be controlled. Men and women of all ages were taken from their homes at night, herded into concentration camps and deported eastward. Families were separated, over 2,000 children were left behind by their parents and many suicides were reported from Paris. Protests from the French public and church authorities were of no avail. Several thousand evaded arrest and fled over the border into Switzerland, others over the demarcation line into unoccupied France.

Within a few weeks similar deportations were instituted in southern France. All exit permits were cancelled in southern France and it was announced that none would be reissued to Jews of other than French nationality. Over 5,000 refugees escaped over the French border into Spain and Portugal. Deportations of Jews were also under way at the same time in Norway, the Netherlands and Belgium.

When Germany occupied southern France in Nov. 1942 all avenues of escape from Europe were cut off except for those who had managed to enter Spain and Portugal. It was estimated that from 50,000 to 60,000 central European refugees remained in southern France. The occupation of North Africa by British and American forces brought prospects of release to some 20,000 eastern and central European and 25,000 or more Spanish refugees who had escaped to that area in previous years.

On Dec. 17, 1942, a joint statement was issued by the governments of Belgium, Czechoslovakia, Greece, Luxembourg, the Netherlands, Norway, Poland, Union of Soviet Socialist Republics, the United Kingdom, United States and Yugoslavia and by the French National committee, giving cognizance to the persistent reports of deportations, mass executions and enforced ɔour practices instituted by the German authorities against e Jewish race in Europe and condemning these persecutions as "policy of cold-blooded extermination."

Action by the League of Nations High Commissioner for fugees and the Intergovernmental committee which grew out the conference of 32 governments summoned by President anklin D. Roosevelt at Evian, France, in 1938, was severely tricted by the war. Interventions on behalf of individuals d special groups of refugees were made with countries of nsit or of final immigration with respect to releases from ernment and admissions. These organizations and the Inter- ional Labour Office were giving consideration at the end of the ır to plans for more adequate treatment of the refugee problem er the war. It was generally accepted that the refugee blem would have to be treated as an essential part of the ger problem of dislocated population groups. (*See* also CHILD ELFARE; JEWISH RELIGIOUS LIFE.)

ichenau, Walter von (1884–1942?), German army officer, was born in Karlsruhe, Ger- ny. The son of a general of the artillery, he followed his ıer's footsteps, joining an artillery unit in 1903. During rld War I, he served on the German general staff and in the ly days of the nazi regime, he was regarded as one of Hitler's ourites. He was raised to the rank of a lieutenant general in Polish campaign in 1939 and was made a field marshal in y 1940 in recognition of his generalship in the French blitz- g a month earlier. Marshal von Reichenau was in command he German army that scored initial successes against Marshal lenny's Russian forces in the Ukraine campaign in the fall of 1. In Nov. 1941, von Reichenau's armies met defeat at the ds of Marshal Timoshenko and he was driven out of Rostov. erne dispatch Jan. 17, 1942 said Marshal von Reichenau died apoplexy while travelling back to Germany "for reasons of lth."

isner, George Andrew (1867–1942), U.S. Egyptologist, was born Nov. 5 in In- ıapolis. He received his Ph.D. degree from Harvard university took graduate work there in Semitic languages. From 1905 942, he was in charge of excavations in Egypt sponsored by vard university and the Boston Museum of Fine Arts. His t famous discovery was the alabaster sarcophagus of Queen epheres, mother of Cheops. His excavations of tombs and amids in the Anglo-Egyptian Sudan shed new light on Ethi- n culture. Dr. Reisner compiled an outline of the history ncient Ethiopia from 750 B.C. to A.D. 350. His findings were rded thoroughly and in minute detail, describing vividly the ent customs and culture of the Pharaohs. He died at the amids of Gizeh, June 7.

lander, Lauri Kristian (1883–1942), Finnish statesman, was born May 31 and educated at Helsinki university. A member of the agrarian y, he sat in the diet from 1910 to 1913 and from 1917 to 9, and was minister of agriculture from 1918 to 1920. He president of Finland, 1925–31. Long considered Finland's ing authority on agriculture, he was credited with the suc- of his country's varied farm projects. Dr. Relander died Feb. 9 in Helsinki. (See *Encyclopædia Britannica.*)

Relief. President Roosevelt's appointment of Governor Herbert H. Lehman of New York state as director of Relief and Rehabilitation in Occupied Countries marked a new direction for relief in the United States. Money from the Lend-Lease fund will be made available as required, and while many of the details of its administration are necessarily in the formative stage, its announced policy is to work in connection with the military and civil governments which may be set up in various countries, with special attention to such measures as will most effectively place their citizens upon an independent footing. Two of the outstanding public welfare officials of the United States, Fred Hoehler of Chicago and William Hodson of New York city, were sent by Governor Lehman to Africa to explore the needs and possibilities.

Trends in general and in work relief noted during 1940 and 1941 were continued on even an accelerated rate. In England, whereas there were 128,000 persons on the rolls of the assistance board receiving relief (unemployed workers and those in need because of enemy action) in March 1941, the number had shrunk to 44,100 in March 1942 (the latest date for which figures were available). Money cost showed a proportionate decrease, from £12,767,000 in March 1941, to £4,500,000 in March 1942. Comparable figures for the United States were not so striking, but present the same picture. In Sept. 1941 there were 818,000 families on relief and 1,007,000 men and women on Work Projects administration (work relief), whereas in Sept. 1942 the numbers were 528,000 and 382,000 respectively. Payment for general relief decreased from $18,503,000 in Sept. 1941 to $12,998,000 in Sept. 1942; and for work relief from $60,439,000 to $26,432,000 in the same period. In Dec. 1942 the president ordered the closing of all federal works projects under this category, and by Feb. or March 1943 all expenditures for this method of relief were to cease.

However, in what is called in the United States categorical assistance—aid to the blind, aged and dependent children—there was a gradual and uneven increase in both United States and Great Britain. The assistance board of Great Britain granted 987,235 supplementary pensions in March 1941 to the aged and dependent widows, at a cost of £15,438,000, whereas in March 1942 the figures had risen to 1,133,597 persons and £27,500,000. The story again was not quite so striking in the United States, where recipients of old-age benefits increased from 2,205,000 to 2,245,000 between Sept. 1941 and Sept. 1942, and the money involved in these benefits increased in the same period from $46,190,000 to $50,318,000. In aid to dependent children, comparable figures for the same interval were 384,000 and 382,000, showing a slight shrinkage and $12,565,000 to $13,054,000 change in benefits. It was the general opinion of those closest to the situation that not only were children going to work younger than the assistance plan anticipated, and so thus reversed a trend that had been constant and unmistakable after the enactment of the Social Security bill in 1935, but the same authorities saw evidence that the same influences depressing the upward curve in old-age assistance were also at work: men and women who might in a glutted labour market find it impossible to find work or not even attempt it succeeded in securing employment under war conditions, and thus either did not apply as they reached the eligible age, or took themselves off the rolls by getting a job. No such reversal of trends, however, was observable in Great Britain, probably because the drain on manpower was felt at least two years earlier than in the United States. In the United States, and to a less degree in Canada, there was widespread criticism directed against assistance of almost any sort, except old age, based on the failure of most of the public to have a realistic understanding of the wide variety of factors, other than the economic one of unemployment, that created dependency. Hence there was impatience of any program to liberalize assistance or to make eligibility less stringent. In Great Britain, on the other hand, the social services, including assistance, were liberalized, as in the supplementary grants to the aged, during the course of the war.

The war chest movement, started in 1941 as a natural expansion of the peace time community chest in Canada and the United States, collected more money than in 1941. Strictly for regular activities, eight chests in Canada, reporting up to the end of November raised in 1942 the sum of $2,278,809 as against $2,180,771 in 1941. In the United States, 257 chests reporting at the same time raised $65,485,527, as against $51,927,323 in 1941. In both countries, these sums were in addition to money raised for specific war relief, such as navy or army relief or the Red Cross, none of which was included in the various chests. The Red Cross made no appeal for war funds in the U.S.A. in 1942, but planned to do so early in 1943.

In June 1942 the United States congress brought that country into line with the other nations of the allies by passing an allotment and allowance act, whereby the enlisted man earning not more than $90 a month might allot $22 (or more, by a later revision) to a spouse or dependent relative, to which the government added an allowance, whose size varied with the number of dependents and their relationship to the enlisted man. In Great Britain and Canada the administrations of allowances to dependents of enlisted men were flexible enough to permit them to meet exceptional situations, so likely to occur in any general scheme, but no such discrimination was possible in that of the U.S.A. In World War I, the Red Cross filled in all the gaps between needs of the soldier or his dependents and governmental provisions. In April 1942, however, an agreement was made between the Federal Social Security board and the Red Cross whereby the latter assumed responsibility for needs of enlisted men and for informational service either to the men or their families. On public welfare authorities lay responsibility for meeting need arising among families of enlisted men.

The dominating place of the war forced social agencies, public and private, into new activities. In London, for example, new services for refugees from British territories were instituted; homes for aged evacuated from their own homes by enemy action have been opened; means for distributing American and Canadian war relief set up, and bureaus for information to those made homeless by bombing or evacuation of dangerous areas established, as well as various provisions for their emergency care In the Americas, up to Jan. 1, 1943, untouched by actual violence of war, certain dislocations of communities and families demanded immediate attention such as care of children of working mothers, housing and community facilities in areas having a sudden growth as well as attention to provision for recreation for the young.

This sudden emergence of new needs and means for meeting them gave rise to some overlapping and confusion. In the United States two federal organizations were launched, the Office of Civilian Defense, and the Office of Defense Health and Welfare Services, which acted as stimulators and co-ordinators of local activities, and in certain functions even granted aid to local projects. In Great Britain, the Assistance board retained the responsibility for giving the necessary relief or for co-ordinating the efforts of other agencies, although perhaps not entirely with success any more than in the more loosely organized Americas, as complaint was made early in 1942 that the Lord Mayor's fund of London of over £2,000,000 was used quite without reference to what other authorities were doing in the same field. Somewhat the same criticism was voiced in the United States with reference to the army and the navy relief funds.

For any solicitation of funds at all connected with needs created by war at home or abroad, the Canadian government created the National War Charities Fund Advisory board, and in the United States the War Relief Control board was established in the state department by executive order. These bodies reviewed budgets, recorded results of solicitations and, when deemed fitting, advised the public when enough had been contributed, as the control board did in November, by stating the war and navy funds had collected enough to meet their requirements. (*See* also Child Welfare; Municipal Government; Social Security; Social Service; Unemployment.)

Religion. The conflict between war and conscience furnished a central issue for the discussions and utterances of nearly all church bodies during the year. Majority opinion in religious circles found ground for moral judgment in a balancing of the enormous values involved in the outcome of the war against its colossal evils. The report on the state of the church presented to the biennial meeting of the Federal Council of Churches of Christ in America declared that "there are moral issues at stake in this war for which the Christian as Christian should have special concern." The Gallup poll in May indicated that six out of ten Protestant and Catholic ministers of the United States thought they should support the war and give full co-operation to the government But strong pacifist minorities continued to voice positions within the federal council and in numerous denominations, and the declarations of Protestant bodies in support of the war frequently were moderated by the feeling that the churches supported the government too uncritically during World War I and by the resolve that the churches themselves must not split on the war issue

The most representative utterances of the churches declared that all governments should be kept under moral criticism and that in no absolute sense could the cause of any nation be identified with the will of God.

Other ethical problems forced to the front by the breakdown of civilization and prominent in discussions and utterances of practically all churches included those of anti-Semitism, and of other racial minorities. There was serious effort to understand the revolutionary social changes under way in the world in the light of Christian ideals and a growing inclination to raise the question of serious modifications in the social order after the war. The "leftist" tendencies of the new archbishop of Canterbury, as voiced in his Albert hall speech of Sept. 26 and in numerous publications, did not prevent the British government from raising him to the highest position in the Anglican church Numerous clear-cut declarations on social ethics came from Catholic sources, for example that of the Inter-American Seminar on Social Studies in September in elaboration of the well-known papal encyclicals.

Under war pressure significant changes occurred in the relations of churches and communions to one another. War pressure forced together contending creeds and sects. Closer relations between Protestants and Catholics were developed most effectively in England. A strong popular movement of religious revival and application to social issues was conducted under a joint committee of the Catholic "Sword of the Spirit" movement and the Religion l Life movement of the Anglican and free Protestant churches. eat public meetings were alternately chaired by the archbishop Canterbury and the Roman Catholic cardinal. Even more matic were the concurrent utterances of Protestant and Roman tholic leaders in France in condemnation of anti-Semitism and mistreatment of refugees. On the other hand, eastern Ortho- c churches in nations involved in war complained against Roman tholic activity in territory traditionally Orthodox, and the erican Roman Catholic hierarchy in a pronouncement in No- nber criticized Protestant missions in South America as con- ry to the good neighbour policy in a normally Catholic land. s got a somewhat pointed reply in a resolution passed by the eral council of churches. Protestant interchurch relations ved toward unity on numerous lines. (*See* CHRISTIAN UNITY.)

The terrible human vicissitudes which go with war and the akup of civilization were naturally reflected in the institutional tunes of the churches. In the totalitarian and conquered coun- s some were oppressed to the point of virtual extinction; and church everywhere was hindered in activities believed to be ential to its mission. Vast population movements in the United tes heaped up unassimilated masses of people in temporary mmunities and housing projects around great defense industrial tres, withdrew virility, leadership and financial strength away n tens of thousands of smaller communities and made the lot he churches at both ends of the process exceedingly difficult. supply of ministers was greatly reduced by those who went war as volunteers and the greatly expanded demands of the plaincy for the armed forces. In the United States the finan- support of religion, in general, held up fairly well but there e widespread fears as to the effect of immediately impending ation. Numerous church colleges and other institutions were ed into financial straits and faced possible obliteration.

reative religious thought suffered a decline. The year 1942, ever, saw the publication of a number of competent Biblical lies, as well as a considerable outpouring of devotional litera- , much of it aimed at furnishing spiritual comfort and lance to soldiers.

Widely diffused concern for the postwar world order, expressed ess formal fashion, must be regarded as one of the primary gious phenomena of the year. This concern strongly united e who differed as to the war. It was reflected in the United es by the studies and conferences of the influential commis- on the basis of a just and durable peace, set up by the eral council, and by very numerous declarations and publica- s by British religious leaders. Meanwhile the church's works mercy and relief for war prisoners and refugees and the sup- of orphaned missions, cut off from their parent churches by , went steadily forward. The rehabilitation of the European rches and Christian institutions after the war was formally gnized as a great and peculiar task for the churches as soon ostilities cease. presentatives, House of: *see* CONGRESS, UNITED STATES; CTIONS.

publican Party. When the 77th congress convened for its second session on Jan. 5, 1942, the ublicans held 28 senate and 164 house seats. Senator Charles McNary of Oregon continued as Republican senate leader, Representative Joseph W. Martin, Jr., remained as house er and as chairman of the Republican National committee. resentative J. William Ditter of Pennsylvania headed the ublican Congressional committee, and former Senator John G. Townsend, Jr., of Delaware served as chairman of the Republican Senatorial committee.

Though sharply divided in their attitude toward the administration's foreign policies prior to Pearl Harbor, the Republicans in 1942 supported measures aimed to mobilize the full resources of the nation in the global struggle to defeat the axis. Entrance of the United States into the war virtually put an end to the earlier division between noninterventionists and interventionists. There was a difference of opinion, however, among party leaders on the postwar international role of the United States.

On April 20, the Republican National committee met at Chicago to define the party's position on war issues. Wendell L. Willkie, Republican standard bearer in 1940 and a strong supporter of the administration's international policies in 1941, urged that the committee approve a statement favouring the co-operation of the United States in building a new world order. Senator Robert A. Taft of Ohio, runner up to Mr. Willkie in the 1940 convention, held that the party should postpone a definite stand on postwar reconstruction until after the war.

The resolution on foreign policy adopted by the committee at Chicago said:

> We realize that after this war the responsibility of the nation will not be circumscribed within the territorial limits of the United States, that our nation has an obligation to assist in the bringing about of understanding, comity and co-operation among the nations of the world in order that our own liberty may be preserved and that the blighting and destructive processes of war may not again be forced upon us, and upon the free and peace-loving peoples of the earth.

The committee recorded its opposition to any effort by the administration "to use the war emergency as an excuse for the extension in domestic affairs of unsound economic panaceas," and demanded a drastic reduction in nonessential government expenditures, the elimination of "nonessential domestic regulations," and the "weeding out of inappropriate and unfit political appointments throughout the government's war machinery."

In a "declaration of policy," closely paralleling the committee's Chicago resolution, Republican members of the house, on Sept. 22, asserted that the United States had "an obligation and responsibility to work with other nations," called for "an efficient and unrelenting prosecution of the war," expressed their opposition to a negotiated peace, until the United States and its allies were able to dictate the peace terms, and urged a drastic cut in nondefense spending. Representative Martin, as national chairman, travelled widely during the year, addressing state and local party groups. In his speeches he emphasized the need for a strong Republican party, and the maintenance of the two party system.

Republican candidates were victors in two of the three special elections held in 1942 in each case winning a seat previously held by a Democrat. (*See* also ELECTIONS.)

Following the November elections, Representative Martin issued a call for the national committee to meet at St. Louis on Dec. 7, and announced that he would present his resignation to the committee at that time, in order to give his full time thereafter to his duties as Republican house leader. The committee, on the third ballot, elected Harrison E. Spangler of Iowa as its new head. The defeat of Werner W. Schroeder of Illinois, who led on the earlier ballots, was interpreted by some political observers as a victory for Mr. Willkie, who had opposed the election of Schroeder because of his views on foreign policy.

Senator Taft, a supporter of Schroeder, was selected to offer the committee's war resolution. In this, the committee affirmed the principles of the April 20 declaration, pledging itself "to victory over our foreign enemy, and a just peace when war shall end, and to the preservation of the republic under our constitution."

Shortly before the adjournment of the 77th congress on Dec. 16, Representative Hamilton Fish of New York, outspoken noninterventionist prior to Pearl Harbor, resigned from the House

HAMILTON FISH, Republican representative of the 26th New York district, talking at a political picnic in the summer of 1942. Fish, especially marked for "purging" by the New Deal, won in the election of Nov. 3, 1942. The Republicans gained 47 seats in the house of representatives in this election

Foreign Affairs committee, where he was ranking minority member. On Dec. 17 former Senator John G. Townsend of Delaware was again named head of the Republican Senatorial committee, to serve through the 1944 campaign.

As 1942 ended, the Republicans, with the largest representation in the new national legislature since the 72nd congress (1931–33) prepared to play a more important part in shaping war measures and domestic legislation. (*See* also UNITED STATES.)

Rhode Island.

A north Atlantic state of the United States, in New England; one of the 13 original states; popularly known as "Little Rhody." Area, 1,214 sq.mi. (smallest of the United States); pop. (1940) 713,346. The urban population was 653,383 (91·6%). Capital, Providence (253,504). Other cities include Pawtucket (75,797); Woonsocket (49,303); Cranston (47,085); Newport (30,532); Warwick (28,757); Central Falls (25,248).

History.—At the regular 1942 session of the legislature, leading measures passed included the following:

An act providing for absentee registration for service men; an act permitting Rhode Island citizens in the armed services to vote by absentee ballots; an act granting leave of absence to state employees who entered the armed forces or were loaned to federal agencies; an act authorizing local housing authorities to convert slum clearance projects to defense housing projects; authorization for local governments to deal directly with the federal government in contracts for defense public works; an act giving general authorization to cities and towns to appropriate for civilian defense needs; an act granting emergency defense powers for the governor and the state council of defense; an act placing the state sickness insurance system under the unemployment compensation board; provision for increase of about 12½% in unemployment compensation benefits; authorization for recipients of old-age pensions to live with relatives and hold insurance up to $500; provision for reduction of employee contributions to the unemployment compensation fund from 1½% to ½% of the individual's wages, the 1% being diverted to the new state sickness insurance fund.

The chief executive officers of the state elected in Nov. 1940 for 1941–42 were: J. Howard McGrath, governor; Louis W. Cappelli, lieutenant governor; Armand H. Cote, secretary of state; John H. Nolan, attorney general; Russell H. Handy, general treasurer. The same officers were elected in Nov. 1942 for 1943–44.

In the 1942 gubernatorial election, McGrath (Dem.) received 139,407 votes; McManus (Rep.), 98,741. Edmund W. Flynn was chief justice of the supreme court.

Education.—During 1941–42 there were in the public elementary schools 61,625 pupils and 2,154 teachers; in junior high schools 22,488 pupils and 963 teachers; in senior high schools (three years) 16,759 pupils and 816 teachers; in senior high schools (four years and vocational) 5,074 pupils and 218 teachers.

Public Welfare, Charities, Correction.—The total number of persons receiving relief in all categories (including a small amount of overlapping among categories) in Nov. 1942 was 17,656, or about 2.5% of the state's population. The total amounts paid out during the year Dec. 1, 1941–Nov. 30, 1942 were as follows: state unemployment relief and general public assistance $1,569,782; soldiers' relief $77,240; old-age assistance $2,078,391; aid to dependent children $773,960; aid to the blind $26,254. In unemployment compensation, the gross amount of benefits paid during 1942 was $4,741,690.40 to 46,114 different individuals. The amount paid into the fund during 1942 was $16,090,619.18. WPA monthly average employment for the year ending June 30, 1942 was 3,693. Total expenditure for the fiscal year was $3,619,637.16.

There were 782 inmates in correctional institutions in Oct.–Nov. 1942, and 4,596 patients in charitable institutions and institutions for defectives.

Communication.—The total mileage of highways on Dec. 1 1942 (excluding city streets) was 2,680.86. Expenditures (1942) for the 801.58 mi. of constructed state highway system totalled $3,154,475.36. The total mileage of railways was 188.9. Waterborne commerce of the state for 1940 was 7,389,110 tons. Airways totalled 120 mi.; there was one airport, two landing fields. In Jan. 1942 there were 138,762 telephones in service.

Banking and Finance.—There were 35 banking institutions in 1942. Resources of 23 banks under state supervision totalled $492,342,944.94 and of 12 banks under federal supervision, $174,481,579.00. Savings deposits (exclusive of club accounts) in savings banks and trust companies (the 23 state banks) amounted

$316,139,941.50 on June 30,)42. In addition, six loan and vestment companies had re- urces of $9,335,862.95; eight ilding and loan associations, 3,328,200.93; 23 credit un- ns, $5,196,199.76.

At the close of the fiscal ar, June 30, 1942, total state ceipts were $20,256,960.20; penditures and encumbrances, 9,034,006.94; surplus from eration, $1,222,953.26. The ate gross debt was $29,333,000; net debt $23,990,695.83.

Agriculture.—The total estimated value of agricultural pro- ction was $16,280,000 in 1942 and actual value was $12,750,- o in 1941. Total acreage harvested was 50,000 in 1942 and ,600 in 1941. Cash income from crops in 1942 was $5,660,000; om livestock, $9,710,000; from government payments, $107,000 total of $15,477,000.

Manufacturing.—The total estimated value of manufactures s $516,390,541 for 1939 and $517,196,193 for 1937. Total em- oyment in 1939 was 106,269 wage earners and 12,005 salaried rsonnel. The number of establishments was 1,460. Wage earn- received $105,406,950 and salaried personnel $27,940,576. igures for 1941 were not obtainable from bureau of the census.)

Mineral Production.—The value of mineral production in ode Island is small: $980,916 in 1939 and $911,599 in 1938. one ($558,944 in 1939 and $511,620 in 1940) and sand and avel ($265,631 in 1939 and $333,612 in 1940) are the principal oducts. (M. C. Ml.)

hodes, Edgar Nelson (1877–1942), Canadian statesman, was born Jan. 5 in Amherst, S., and finished his education at Acadia and Dalhousie universi- s. He was elected to the dominion house of commons in 1908, ving as speaker from 1916 to 1918. He became Conservative emier of Nova Scotia in 1925, federal fisheries minister, 1930, leral finance minister, 1932, and senator, 1935. As premier of va Scotia, he abolished the legislative council. He died at a spital in Ottawa, Ont., March 15.

hodesia. The territory extending from the Transvaal border northward to the boundaries of the Belgian Congo d of Tanganyika Territory. It is bounded on the east by Portu- ese East Africa, Nyasaland and the Tanganyika Territory, and the west by Belgian Congo, Portuguese West Africa and chuanaland. Area 440,656 sq.mi.; comprises two territories of British empire; viz., Southern Rhodesia and Northern Rhodesia. Southern Rhodesia is a self-governing member of the British commonwealth, but supervision over native rights is reserved to the imperial government. Northern Rhodesia remains a dependency of the crown. Certain essential statistics are given in the accompanying table. (*See* also BRITISH EMPIRE.)

Rhodesia

Territory and Area in sq. mi.	Principal Products	Imports and Exports (in thousand £)	Road and Rail	Revenue and Expenditure (in thousand £)	Education: Elementary and Secondary 1938

History.—The demands made in 1942 for increased production in these two territories of foodstuffs and basic metals intensified the chronic shortage of African labour, which was further depleted by military requirements. Two steps were taken to meet this shortage. Conscription of Africans was resorted to in Northern Rhodesia early in 1942 and in Southern Rhodesia in June 1942 in order to insure a labour supply, under conditions which were laid down for the protection of the workers. In Northern Rhodesia an African labour corps was raised to assist employers, especially farmers, who were engaged in work important to the war effort. Details of a provisional labour agreement between the Rhodesias and Nyasaland were published in June 1942. This agreement was to remain in force for two years and was intended to regulate the flow of migrant African labour and to provide adequate safeguards.

Southern Rhodesia.—Southern Rhodesian white troops took an important part in the campaigns in North Africa, and the African regiment, the Rhodesian African Rifles, also acquitted itself well. Plans were made to improve and co-ordinate the cattle industry in the country. The Salisbury municipal council appointed a director of native labour.

Northern Rhodesia.—Munitions were being made in 1942 on the Copper Belt in three workshops, and others were shortly to be opened. In order to improve overland communications between South Africa and Kenya, work was begun to reconstruct the Great North road between Northern Rhodesia and Kenya to an all-weather standard at a cost of £355,000. To prevent the spread of rinderpest from Southern Tanganyika a game fence was built along the Northern Rhodesian border with Tanganyika, and an armed guard would prevent movements of game to the south. As a result of arbitration between the Northern Rhodesian government and the North Charterland Exploration company, the company was awarded a sum of £153,985 for 3,776,741 acres of land. Part of this newly acquired land was allocated to the African tribes to relieve the shortage of land in the reserves near Fort Jameson. The agricultural department made a detailed survey of the area, of soil and vegetation, and anti-erosion measures were put in hand. (M. Rd.)

Ribbentrop, Joachim von (1893–), German statesman, was born April 30 at Wesel on the Rhine and was educated at the gymnasium at Metz. In 1910 he went to Canada as an independent merchant. At the outbreak of war in 1914 he returned to Germany, enlisted in a Hussar regiment, advanced to lieutenant colonel, and by the end of the war was attached to the war ministry. After the war he returned to private business as a wine merchant. He first became identified with the nazi party as a worker in 1930. At his home in Berlin-Dahlem were held the important meetings that preceded Hitler's appointment as chancellor of the reich, Jan. 30, 1933. In 1935 Ribbentrop was appointed ambassador-at-large, and from 1936 to 1938 he was ambassador to Great Britain. He became foreign minister Feb. 4, 1938, and played a prominent role in the diplomatic negotiations that preceded the war.

In Jan. 1942, Ribbentrop conferred with Premier de Bárdossy of Hungary in an effort to get the latter to give more aid to the Reich. In May he was present at the Hitler-Mussolini conferences in Salzburg and later that month conferred with Pierre Laval. On Sept. 27, 1942, the second anniversary of the Rome-Berlin-Tokyo pact, Ribbentrop asserted that Russia was nearing exhaustion; two months later, Russia's "exhausted" armies were engaged in four major offensives.

Rice, Alice Caldwell Hegan (1870–1942), U.S. novelist, was born Jan. 11 in Shelbyville, Ky. After graduating from Hampton college, Louisville, Mrs. Rice did social work and in the course of her visits to the poor, met a humorous and philosophical woman, head of a large family, who inspired *Mrs. Wiggs of the Cabbage Patch* (1901), her first novel. It was her most successful book and was widely translated and dramatized for the stage and movies. She and her husband, Cale Young Rice, poet and dramatist, collaborated on several books, and their extensive travels in Europe provided them both with material for their literary works. *Lovely Mary,* a sequel to Mrs. Wiggs, appeared in 1903 and was followed by *Sandy* (1905); *Captain June* (1907); *Mr. Opp* (1909); *A Romance of Billy Goat Hill* (1912); *The Honorable Percival* (1918); *Mr. Pete and Co.* (1933); *The Lark Legacy* (1935); *My Pillow Book* (1937); *Our Ernie* (1939); and *The Inky Way* (1940). Mrs. Rice died Feb. 10 at Louisville, Ky.

Rice. The western hemisphere, which formerly depended largely on the orient for its rice supplies, probably produced in 1942 a surplus sufficient to supply lend-lease shipments of an estimated 400,000,000 lb. to the Allies. Ten years ago most South American countries imported rice. The 1942 crop in Brazil, although the latter part of the season was unfavourable, produced an export surplus of 155,000,000 lb., according to U.S. commerce department reports. Expanded acreage in 1942 in the United States, although the yield was below average, produced a record crop of 66,363,000 bu., compared to 51,323,000 bu. in 1941 and a ten-year (1930–39) average of 45,712,000 bu. The 1942 area harvested was 1,477,000 ac. as against 1,214,000 ac. in 1941 and a ten-year average of 943,000 ac. The yield in 1942 was 44.9 bu. per ac. In 1941 it was 42.3 bu.; the ten-year average was 48.4 bu. per ac. In California a low-yielding acreage was included in the 1942 expansion, thus affecting the yield per ac. Four states produced the rice crop grown in the United States.

Chile produced a record crop of 86,041,000 lb. in 1942, compared to 61,327,000 lb. in 1941. The Dominican Republic reported an exportable surplus of 20,000,000 lb., as against 8,659,000 lb. in 1941. Although Ecuador, the third largest rice-producing country in the western hemisphere, had a record crop of 5,697,000 bu. in 1942, the government forbade exports until domestic needs had been satisfied. The Ecuadorian crop in 1941 was 4,491,000 bu. Mexico also achieved a record in 1942, with 6,000,000 bu., compared to 5,551,000 bu. in 1941. Cuba had imported an average of 437,000,000 lb. of rice annually in the previous six years, but in 1942 increased domestic production sufficient to reduce import needs by about 30,000,000 lb. The Republic of Panama Oct. 8, 1942, placed an embargo on imports of rice, to protect local farmers who had been encouraged to increase production. Uruguay was reported to have an export surplus of 2,000,000 lb.

U.S. Production of Rice by States, 1942 and 1941

State	1942 bu.	1941 bu.	State	1942 bu.	1941 bu.
Louisiana . . .	25,758,000	20,400,000	Arkansas . . .	13,515,000	10,918,000
Texas	15,498,000	11,590,000	California . . .	11,592,000	8,415,000

Argentine production in 1942 was described as sufficient for home consumption and a possible small export.

In Egypt a government-supported effort to increase production was counteracted by an unfavourable season which reduced the crop from 33,607,000 bu. in 1941 to 29,339,000 bu. in 1942.

(S. O. R.)

Rickenbacker, Edward Vernon (1890–), U.S. airline executive, was born Oct. 8 in Columbus, Ohio. The entry of the United States into World War I interrupted his career as an auto racer. At first, he was chauffeur to General Pershing; later he was transferred to the air force, was promoted to captain of the 94th aero squadron and shot down 26 enemy planes in battle. He won the Congressional Medal of Honor for shooting down two and routing five of seven German planes that attacked him over France in Sept. 1918. After the war, he returned to the motor car trade and eventually joined the General Motors company as an executive. Later he became president of Eastern Airlines. During World War II, he was assigned to England to investigate reports that U.S. planes were inferior to models of other countries. On returning to the United States in the early fall of 1942, Rickenbacker declared that U.S. craft had good performance records but were not superior to other makes. While flying on a similar mission across the Pacific, his plane ran out of gas on Oct. 21 and he was virtually given up for lost. But Rickenbacker, who had brushed with death many times, was found alive on a rubber raft after floating 23 days at sea north of Samoa. He was brought to a base in the South Pacific for hospitalization, and was returned later to the United States.

Ríos Morales, Juan Antonio (1888–), Chilean statesman, was born Nov. 10 in Cañete, Chile. He studied law and was admitted to the bar in 1914. Four times elected to the national congress as a radical deputy, he was twice president of his party. In 1932, he was minister for the interior in the Allessandri cabinet for three months and then was shifted to the post of justice minister. After the death of Pres. Aguirre Cerda, Ríos, radical candidate, was elected president in Feb. 1942 by a majority of 56,000 votes. It was believed that he would adhere to the anti-axis and pro-democratic policy of his predecessor. He refused, however, to break off diplomatic relations with the axis and postponed a scheduled trip to Washington in Oct. 1942 after Sumner Welles, U.S. undersecretary of state, had declared in a speech that axis agents operating freely in Chile and Argentina were transmitting news of United Nations ship movements to German and Italian submarines. On the first anniversary of Pearl Harbor, Dec. 7, 1942, President Ríos in a message to President Roosevelt declared that Chile "has been and will be at every moment at the side of the democracies."

Ritchie, Neil Methuen (1897–), British army officer, was born July 29, and was educated at the Royal Military college at Sandhurst. He entered the army at the age of 17 as 2nd lieutenant in the famous Black Watch regiment (42nd Highlanders). He served on the western fron d in Mesopotamia and Egypt in World War I. He was wounded action and won the distinguished service order and military oss. In 1939 he became colonel, was an acting brigadier general thin a year and acting major general by Oct. 1940. He had en deputy chief of the middle east general staff for some onths, prior to his appointment on Nov. 26, 1941, as commander the 8th army in Libya, succeeding Sir Alan Gordon Cunningm.

In June 1942, Rommel trapped Ritchie's armoured units, de- oying nearly all his tanks. On June 25, when Rommel was shing his way through Egypt, Gen. Claude J. E. Auchinleck placed Ritchie as commander of the 8th army.

vers and Harbours. Federal improvement and maintenance of rivers and harbours and ner waterway channels in the continental United States and territories and island possessions are carried out by the corps engineers, U.S. army, under the direction of the secretary of r and the supervision of the chief of engineers in accordance th the plans authorized by congress. Reports requested by ngressional directives to ascertain the advisability of further provements of this nature are also made by the corps of engi- ers.

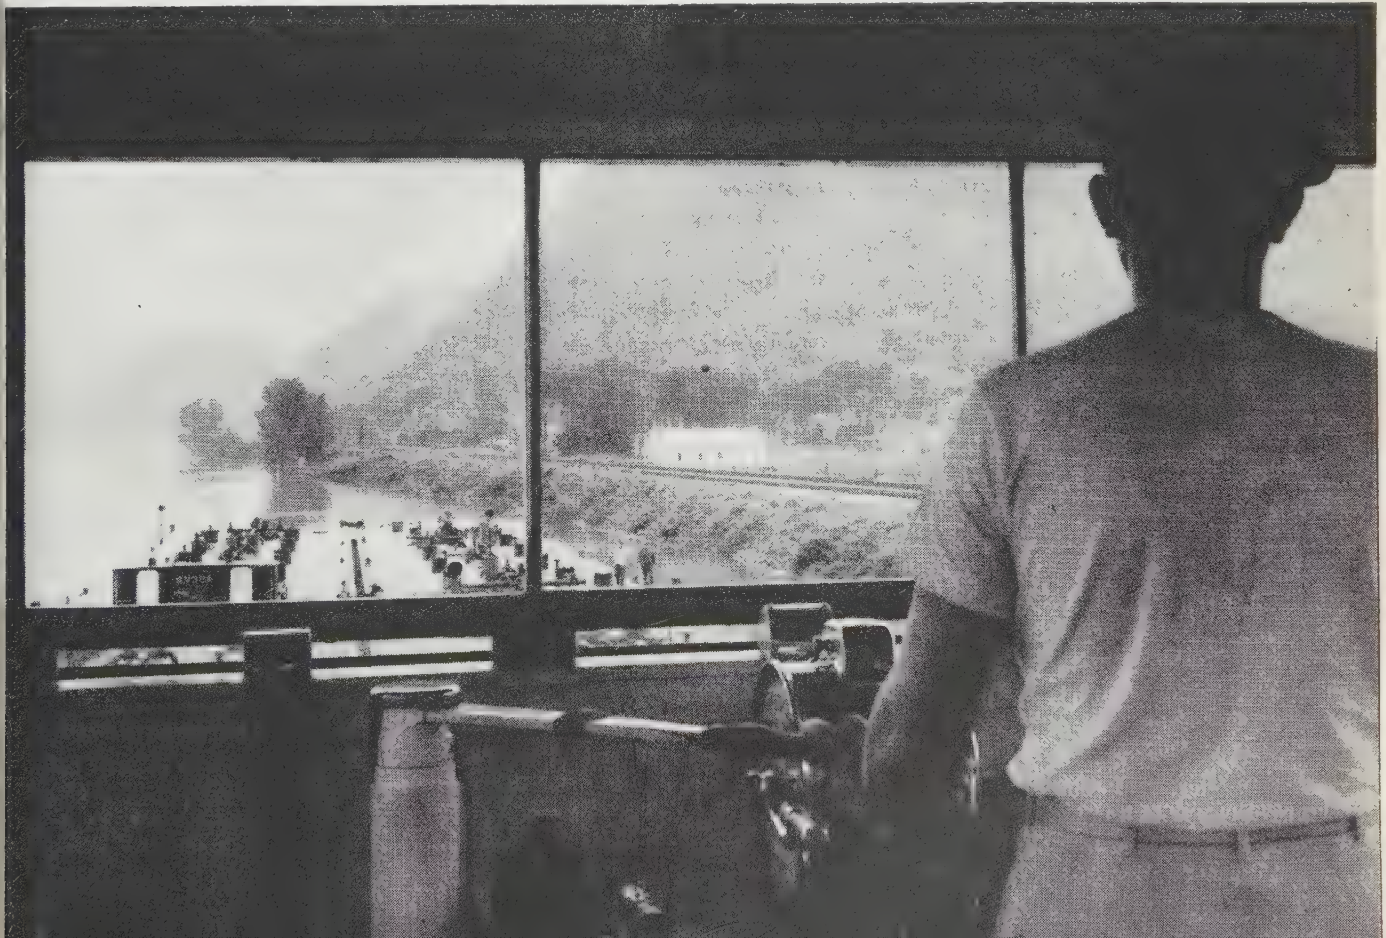
The water transportation facilities provided by these works e vital to the commercial and economic development of the ited States in normal times and are of the utmost importance the nation in time of war.

During the fiscal year ending June 30, 1942, national defense eparation and the advent of war required concentration of ort and the utilization of available construction equipment, terials and manpower on those authorized projects having e greatest connection with the preparedness program and the war effort. In addition to the regular river and harbour operations, work was undertaken on emergency river and harbour projects required by the armed forces.

The principal items of improvement works prosecuted during the fiscal year included the completion of the deep-draught Delaware river channel from Philadelphia to the sea; dredging and rock removal in the Kennebec river from the mouth to Bath, Me.; removal of rock ledge in the main channel of Portland harbour, Me.; dredging of a deep-draught branch channel at Boston harbour, Mass.; dredging and rock removal to deepen and widen the channel in the Hudson river between Albany and the entrance to the New York State Barge canal at Waterford; improvement of the entrance channel from the Gulf of Mexico to Calcasieu river and pass, La.; improvement of the channel in the Saginaw river to Saginaw, Mich.; channel widening and turning basin extension in the Cuyahoga river at Cleveland, O.; continuation of work on the construction of a new landward lock above Hastings, Minn.; dike construction and revetment works on the Missouri river between the mouth and Sioux City, Ia., in the interest of light-draught barge navigation; extension of the breakwater system at Los Angeles and Long Beach harbours, Calif.; power house extension at the Bonneville dam on the Columbia river; and the construction of a power plant at the Fort Peck dam, Mont.

In addition to the above-mentioned waterway and harbour improvements, operations in the interest of water-borne commerce and navigation were undertaken at other localities along the Atlantic, Gulf and Pacific coasts, on inland rivers, and on the Great Lakes. These localities included the Cape Cod canal, Mass.; Providence river and harbour, R.I.; Stamford harbour, Conn.; Bronx river and New York harbour, N.Y.; the New York and New Jersey channels; the Great Lakes to Hudson river waterway; Great Kills harbour, N.Y.; Raritan river and Sandy Hook bay, N.J.; the Chesapeake and Delaware canal; Curtis

EW FROM THE PILOT HOUSE of a petroleum barge train being pushed up Mississippi river in 1942. Traffic on U.S. rivers reached high levels during year as inland waterways were used to relieve the war load on U.S. railroads



creek, Middle river, Wicomico river and Fishing creek, Md.; Norfolk and Portsmouth harbours, Va.; Mattaponi river, Va.; Roanoke river, Oregon inlet and Silver Lake harbour, N.C.; St. Augustine harbour, Fla.; Mobile harbour, Ala.; Pascagoula harbour, Miss.; the Sabine-Neches waterway, Tex.; the Louisiana-Texas Intracoastal waterway; the Mississippi river between the Ohio river and Minneapolis, Minn.; San Francisco harbour, San Pablo bay and Mare Island strait, and Bodega bay, Calif.; the Columbia river between Vancouver, Wash., and Bonneville, Ore.; the Upper Columbia and Snake rivers, Ore., Wash. and Ida.; and Neah bay, Wash. An act of congress approved March 7, 1942, authorized the construction of a new navigation lock at Sault Ste. Marie, Mich. (*See* also AQUEDUCTS; CANALS AND INLAND WATERWAYS; DAMS; FLOODS AND FLOOD CONTROL.) (E. RD.)

Great Britain.—Dock labour schemes were formulated at the leading ports in connection with the Essential Work (Dock Labour) Order, 1941, under the control of a National Dock Labour corporation (with two exceptions, the Merseyside and Clydeside districts which were directly under the minister of war transport) and the seaboard was divided into areas under regional port directors. These schemes, combined with the formation of mobile squads of dock workers, were devised to expedite the loading and discharge of cargo. Perhaps the most notable event in port constructions was the completion, on June 24, 1942, of the Galway harbour development scheme. At a cost of about £200,000 the Dun Aengus dock at the port was lengthened and deepened so as to admit vessels up to 350 ft. in length. The entrance was widened from 54 ft. to 65 ft. and an extension pier, 350 ft. long and 65 ft. wide, constructed with a deep water lay-by on the eastern side. A rocky ledge outside was removed as well as a sand bar, 800 yd. long by 260 ft. wide, in order to afford passage to deep water. Passenger tenders could now leave the dock at all stages of the tide to reach transatlantic liners in Galway bay.

Europe.—In France, there were reports of port reinstatement and development plans at Dunkirk and Fécamp and of further extension of the basin system at Marseilles. The Spanish government displayed activity in promoting schemes at Vigo and Bilbao, while the port of Odense in Denmark had been marked out for various improvements.

Africa.—Very great general interest attached to the practical completion in its general outline of the new Duncan dock at Cape Town, of nearly 300 ac., the construction of which had been in progress for several years. As an appendage thereto, much discussion took place in regard to a proposed new dry dock of outstanding dimensions, which was finally sanctioned by the Union government. It was to be 1,200 ft. long by 150 ft. wide with a depth of 45 ft. of water over sill. The cost was estimated at £2,034,000 and the work was already being commenced.

Development schemes at Durban and East London were also well under way.

It was officially announced towards the close of 1942 that plans and estimates had been approved for the construction of the new port of Nacala in Portuguese East Africa. Nacala has a fine natural harbour where vessels drawing up to 18 ft. can anchor within 200 yd. of the shore. It lies 30 mi. north of Lumbo, which is south of the town of Mozambique.

Australia.—There was also a large graving dock in hand at the port of Sydney, 1,050 ft. long by 137 ft. wide. There was reason to believe that the temporary enclosure dam at the site had been completed and that work on the dock proper had begun. (B. CU.)

Roads and Highways.

In the United States there were great changes in the highway construction program and in highway use because of the war. At the beginning of 1942 the program was already affected by shortage of men and materials. During the year it became necessary to place one restriction after another on the work and by the end of 1942 practically all major highway work not of direct war importance had been stopped. However, a considerable program of road construction to give access to war industries and military and naval installations was carried on. Also, certain critical deficiencies in main highways that were potential dangers or would have dammed back the flow of war traffic were corrected.

The access road program was authorized by the Defense Highway act of Nov. 1941 which provided $150,000,000 for access roads. During the year this was supplemented by an additional $110,000,000. Roads were being built to relieve the great traffic congestion that existed at aeroplane plants, shipyards and munition factories. At many of these places, 75% to 95% of the workers travelled by car and existing roads were unable to accommodate thousands of new workers. Many new roads were needed to open up new sources of raw materials for manufacture into the tools of war—for example, five roads in southwestern Colorado to reach scattered vanadium deposits. Road networks were built interconnecting primary and outlying fields for training flyers. At war centres along U.S. coasts the activities of armed services produced a traffic enormously in excess of that for which the highways were built. Streets were widened and new roads built at these places.

One hundred and twenty access road projects, aggregating 240 mi. in length, were completed, and 888 projects exceeding 4,000 miles in length were under construction or approved for construction. (*See* MOTOR TRANSPORTATION.)

The Highway to Alaska.—Construction of a 1,600-mile highway from the rail and highway terminal at Dawson Creek, Can to central Alaska has been the outstanding highway work of the year. At the beginning of war with Japan, it was considered highly important to establish a land supply route to airports and military bases in northwest Canada and Alaska. The corps of engineers of the army undertook the work and requested the assistance of the Public Roads administration in locating and constructing a highway. The route selected runs from Dawson Creek through Fort St. John, Fort Nelson, Watson Lake, Whitehorse, Tanana Crossing, to Fairbanks. Near Tanana Crossing a branch of the highway connects with the Richardson Highway

w, right: "CARRY-ALL" removing tops of earth from a section of the ka highway, opened to military traffic in 1942

leading to the seaport at Valdez and to Anchorage.

Construction of the highway was pushed rapidly during the summer and fall months by 10,000 engineer troops, and more than 6,000 civilian workers employed by 52 contractors working under the direction of the Public Roads administration.

The road was opened to army traffic in November. The road was not open to civilian traffic and it was probable that civilian use would be possible only under special permit for the duration of the war.

The Inter-American Highway.—Important progress was made on this highway extending from the Mexico-United States border to Panama, thence down the west coast of South America to Valparaiso, thence across the Andes to Buenos Aires and Rio de Janeiro. There was an alternate interior route from Vitor, Peru to Buenos Aires.

After many years of effort, closing of gaps in the United States-Panama section was in sight. At the close of 1941 the United States authorized $20,000,000 to be used on the section of the highway between Mexico and Panama upon the condition that each country in which work was done paid one-third the cost. In 1942, such co-operative construction was under way in Costa Rica, El Salvador and Nicaragua, and it was expected that work would begin soon in Honduras. Mexico was extending the road toward its Guatemala border.

Because of the importance of this route in giving access to raw materials and tropical products, and for continental defense, the war department of the United States was engaged in building a pioneer road to fill in those gaps not being closed by the co-operative construction. On this work the Public Roads administration was indicating the location of a permanent highway and the pioneer road followed this route as closely as was practicable. It was also supervising the construction of permanent bridges over the larger streams. The gaps being closed, including work in co-operation with Central American countries, totalled 625 mi. in length. It was hoped that a road suitable for use by trucks would be available before the beginning of the rainy season in the summer of 1943.

Progress was made on the section of the route from La Guaira, Venezuela to Rio de Janeiro, Brazil, a distance of 8,200 mi. by way of Lake Titicaca, or 325 mi. longer if one went by way of Santiago, Chile. Reports from South America indicated that much of the route might be travelled at any time of the year, but 20% was suitable for use only six months of the year. Work during 1942 increased the mileage that might be travelled in good weather.

The principal bottlenecks on the entire route were the section in Panama adjacent to the Colombian border, for which no provision had been made, and a 290-mi. stretch in Ecuador through mountainous country. A portion of this last section was being improved with a $900,000 loan made by the Export-Import Bank of Washington.

Other work in the Americas.—In the first six months of the year, a 50-mile concrete surface was constructed by Public Roads administration across the Isthmus of Panama, completing the first modern highway across the isthmus which is of great importance in defense of the Panama canal. Mexico announced that construction was continuing on a highway that would link eventually the Gulf of Mexico to the Pacific Ocean across the Isthmus of Tehuantepec. Peru completed a section of its great internal highway from the Pacific across the Andes to Peru's Amazonian jungles.

It was to be extended to navigable water on the Pucalpa river, a branch of the Amazon.

War demands produced great activity in the mines of Bolivia. The western mining district was to be connected with the eastern food producing district by a 225-mi. highway connecti Cochabamba with Santa Cruz. An aerial transporter bridge wa being built across the Espiritu Santo river, a tributary of th Amazon at the edge of a little-explored jungle region of th Amazon. The bridge was to be a combination tramway and sus pension bridge. A tram car, geared to a two-cable track an capable of carrying 80 persons or a 7-ton truck was to provid the means of conveyance across the river. Two 100-foot towe would support the tramway cable.

Argentine publications announced that final agreement betwee Argentina and Brazil had been reached for the construction of a international bridge across the Uruguay river and constructio was scheduled to begin late in 1942. Brazil was making progres on its system of national highways and in 1942 pushed the co struction of main highways in central, southern and wester Brazil. A system of 19,000 kilometres (12,000 mi.) was sched uled for completion within 20 years. Brazil started building de fense highways because of the often-repeated nazi threat to cros the narrow south Atlantic to attack the Americas by way of th Brazilian bulge. Many miles of new strategic highways were com pleted or were in the process of completion, including long sec tions of a coastal military road stretching 4,113 miles fro Fortaleza (north of the bulge) to Porto Alegre (near the Ur guayan border).

Australia.—After the beginning of the war highway work wa directed solely at the war effort. Roads to mineral deposits, wa factories, agricultural areas and military establishments wer built. The road across the centre of Australia to Darwin playe an important part in throwing back the Japanese advance, bu details concerning use of this road and other new military road were not available.

Europe.—Censorship prevented obtaining more than frag mentary information on highway work in England, Germany an other European countries. It was evident that only highwa work of considerable military importance was undertaken.

During the year, England completed a monumental concret bridge across the Thames river to serve traffic bound for the hea of London. Construction of the bridge was carried on success fully while England was subject to heavy bombing attacks.

Germany began the war with approximately half of its 4,20 mile system of Autobahnen completed. There was no evidenc that any considerable improvements were made since, or tha Germany possessed the vehicles and fuel to use additional road if they had been built. Grandiose schemes for extension of Aut bahnen into occupied countries were announced, but if work wa done it was concealed with great success. German technical lit erature reported construction of roads to mineral deposits, fish ing centres, and military establishments in Norway, and als extension of main German roads into Holland.

Union of Soviet Socialist Republics.—This country had littl time for road building in 1942, but extensive roads constructe before war came to Russia, were extremely useful. On the Trans Siberian railroad in the Amur valley, a road struck deep into th wilderness across the Yablonoi mountains to Yakut on the Len river. This road is 540 mi. in length and makes valuable re sources available. In the southern portion of Soviet Turkesta the Osh-Khorog highway crosses the Pamirs at an altitude o 15,587 feet.

The 1,000-mi. road across Iran from an unnamed seaport, b way of Tehran to the Caspian sea, was of great importance to th Caucasus front. It was reported that streams of trucks flowe over this road carrying munitions and supplies. The road through extremely rough country, crossing mountains with de gorges. In a distance of 20 mi. it drops 7,000 ft. to below s level.

hina.—The Burma Road, over which supplies for Chinese
ies flowed from Burma's seaports, was closed to this traffic
it still had much military significance. A Japanese army ad-
ced along the road to the Salween river but Chinese still held
greater portion of the road. The suspension bridge across the
veen was destroyed by the Chinese.

s an alternate to the Burma route the Chinese were increas-
the capacity of the ancient caravan trade route through the
70-ft. Karakorem pass to Sinkiang. A more important route
rom Darjeeling in northern India through Tibet to China.
character of these roads was not such as to permit movement
rge quantities of supplies. General road construction in Free
a continued throughout Japanese occupation of coastal areas.
China had in 1942 about 30,000 mi. of road.

pan.—Statistics of roads given in the Japanese year books
data for March 1939 of 5,350 mi. of national roads more
24 ft. in width; 70,700 mi. of prefectural roads more than
. in width; 35,200 mi. of municipal roads more than 18 ft.
idth; and 456,000 miles of town and village roads 12 ft. in
h.

his last class of roads is generally not fit for motor trans-
ation. There has been a standardization of roads and the
ng of road systems. The most important recent development
the projected trunk highways to strike through the centre of
n from Tokyo to Fukuoko. Progress on this road was un-
vn. There were also important developments on highways
nd cities. (T. H. MacD.)

son, May (1858–1942), U.S. actress, was born April 19 in Melbourne, Australia, the daughter of a
sh naval captain. She was educated in Paris, London and
sels, and moved to New York city with her husband when
was a young bride. Left widowed in her twenties, she found
with a theatre company and made her first appearance
rooklyn, 1884. Her first starring vehicle was *The Rejuvena-*
of Aunt Mary, 1907. Miss Robson made her film debut
silent pictures were in their infancy, survived the transition
lkies, and starred in a score of films. Her most popular
was in a screen version of *The Rejuvenation of Aunt Mary.*
also starred in *Lady for a Day, Mother's Millions* and as
Etta in a series of Lemp "family films." She died at Bev-
Hills, Calif., Oct. 20.

a, Julio Argentino (1873–1942), Argentine politician, was born May 17 in Córdoba. The
f the former president of Argentina, he was groomed for a
r in politics. He was graduated from the University of
os Aires, Faculty of Law and Social Sciences, and then en-
politics. He became national senator, governor of the
ince of Córdoba, 1922–25, and was vice-president during
conservative Justo administration, 1932–38, following which
ecame ambassador to Brazil. During his tenure in the foreign
stry, 1940–41, he negotiated with Uruguay a co-operative plan
he defense of the River Plate area against non-American
ession.

died in Buenos Aires, Oct. 8.

kefeller Foundation was chartered in 1913 for the permanent purpose of "pro-
ng the well-being of mankind throughout the world." Its
ram is concerned with certain definite problems in the
cal, natural, and social sciences, the humanities, and public
h. In the field of medicine its interest is centred mainly in
ous and mental diseases, and a large part of its contributions
nade for the furtherance of research and teaching in psychiatry and allied subjects. Its program in the natural sciences is concerned with experimental biology. In the social sciences the emphasis is on projects contributing not only to the understanding of important social problems, but also to the development of personnel and methods. The program in the humanities centres around the techniques by which cultural levels of contemporary society are being influenced—such as museums, the radio, drama and libraries—and the promotion of better international understanding through cultural interchanges. The program in public health includes research on a number of selected diseases; demonstrations in the control of some of these diseases in their environments; co-operation with governments in services of central or local health departments; and the development of public-health education. During 1942 the foundation appropriated approximately $8,175,000 for work in its various fields of interest. The chairman of the board of trustees in 1942 was Walter W. Stewart; the president, Raymond B. Fosdick; and the secretary, Norma S. Thompson.

General Education Board was incorporated by an act of congress in 1903, with the stated object of "promoting education within the United States of America without distinction of race, sex, or creed." Its program is restricted largely to the support of education in the southern states. During 1942 appropriations approximating $2,235,000 were made by the board. The chairman of the board of trustees in 1942 was Ernest M. Hopkins; the president, Raymond B. Fosdick; and the secretary, William W. Brierley. (H. B. v. W.)

Roman Catholic Church. The pope, Pius XII (*q.v.*), is recognized as the supreme spiritual ruler. In his person reside plenary power, spiritual, legislative, executive and judicial, in all matters of faith and morals. To him, the Catholic faithful throughout the world owe spiritual allegiance, as they owe full civil allegiance to their respective governments.

Appointed by the pope are the cardinals, patriarchs, archbishops, bishops, vicars who govern the ecclesiastical jurisdictions throughout the world. The college of cardinals consists of 70 members with its full complement. Through 1942, no new cardinals had been created by Pius XII since he became pope in 1939. The Sacred college consists of 6 cardinal bishops, 50 cardinal priests, 14 cardinal deacons. Cardinal bishops and priests are always bishops or archbishops. At the beginning of 1942, the college of cardinals consisted of 52 members. The complement was reduced to 49 by three deaths, and at the close of the year the cardinals numbered 29 Italians and 20 non-Italians. Religious orders of men and women in the church consisted of 789,338 members.

The Catholic population of the world in 1942 was estimated at between 399,000,000 and 400,000,000. The number of patriarchates was 14; 7 of the Latin rite, that of the West Indies being vacant, and 7 of the Oriental rites. The number of residential sees in the Catholic Church in 1942 was 1,223, including archbishoprics and bishoprics. Since he became pope in 1939 Pius XII had created 72 new ecclesiastical jurisdictions. Ecclesiastical jurisdictions in the Americas were: United States 117; Brazil 101; Canada 50.

The number of Catholics on the American continent was estimated to be about 111,000,000 in 1942. Catholics in the United States and territories numbered some 22,556,000. There were 2 cardinals, 20 archbishops, 97 bishops and apostolic vicars. The clergy numbered 36,580—23,818 secular and 12,762 regular. Parishes and missions were 18,985. According to Archbishop

ONE HUNDRED THOUSAND ROMAN CATHOLICS prayed for men in the U.S. armed services at a holy hour Sept. 13, 1942, in Soldier field, Chicago

Vehr of Denver, the number of Catholics in the United States armed services was expected to reach a total of 3,500,000. Converts in the United States numbered 82,087. Chaplains in the services numbered 1,101 in July. But the war department and the military ordinariate no longer reveal the actual number of Catholic chaplains in the services. Catholics in the English-speaking countries were estimated to be approximately 56,301,820.

Catholics in England and Wales, excluding the Channel islands under German occupation, were estimated to be 2,334,427. The two dioceses in Wales counted 15,000. Owing to war conditions in England and Wales, 86,000 Catholics were not accounted for. There were 3,903 in the secular clergy of England and Wales and 1,981 regular clergy. Converts in England and Wales for 1942 were estimated to be at least 9,511. Canada, with 50 episcopal jurisdictions, had 5,288,609 Catholics in 1942, an increase over 1941. Catholics in the whole of Ireland were estimated to be 3,250,000; in Scotland, 615,000. The total Catholic population of Australasia was estimated at 1,700,000; of which Australia had 1,500,000 and New Zealand 200,000. Total Catholic populations of the British Commonwealth were estimated at 20,438,856. In Germany and German-occupied countries, Catholics were estimated at 48,000,000.

The Church and World War II.—A stubborn resistance against totalitarianism had been evidenced by the church since the start of World War II. In Belgium Cardinal Van Roey of Malines refused to accept nazi domination of religion in Belgium in a pastoral issued Feb. 1, 1942. The Benedictine abbeys of St. André, Mont César and Maredsous were confiscated by the nazis. Father Weechmans was sentenced to 8 years of hard labour for publishing the Catholic journal *La Belge*. Cardinal Van Roey forbade Holy Communion to Flemish nazis wearing uniforms in church.

The hierarchy of Brazil condemned totalitarianism on Oct. 30, 1942, and urged all Catholics to defend their country in a just war in defense of Christian civilization. Cardinal Hinsley of Westminster, London, on Poland Day, Dec. 8, denounced the nazi persecution of Jews. French Catholic journals opposing collaboration were suppressed by the nazis, as were papal communications. French prisoners of war in Germany had been unable for two years to receive Holy Communion. French archbishops and bishops in pastorals and sermons condemned the barbaric treatment of Jews.

In Germany, in a pastoral, Bishop Von Preysing of Berlin challenged the nazis in their fight against the Catholic Church. Cardinal Faulhaber of Munich denounced insults to the papacy in nazi Germany. Bishop Von Preysing succeeded Cardi Bertram of Breslau as president of the Fulda Episcopal conf ence. On Jan. 1 Dr. Alfred Rosenberg released a 30-point pr gram for a nazi national church. On March 22, in a joint pastor the German bishops cited their protests to the nazi governme charging them with wishing to destroy Christianity. Bishops V Galen of Muenster and Bornewasser of Trier denounced a na government order interning priests in concentration camps.

Many leading Catholic clerics and laymen of the Netherla were interned by the invaders, and some of them died in c centration camps. On April 19, in a joint pastoral, the Du Catholic bishops warned all Catholics against the nazi comp sory labour service. Three Catholic seminaries and a Jes retreat house were closed by the nazis, and the entire religi press was suppressed. Cardinal Rocca of Bologna, Italy, cal for peace and brotherly reconciliation. Three Italian bish protested against the persecution of Slovene Catholics by Itali authorities. In Yugoslavia Croat Catholic bishops condemn attempts to force Orthodox Croats to join the Catholic Chur Archbishop Martinez of Mexico City on May 30 called upon Mexican Catholics to support the government in the war. ligious instruction in Philippine public schools was abolished the Japanese military administration on Aug. 5. Father Mari Morawski, Jesuit professor at the University of Cracow, Pola died of gangrene in the nazi concentration camp at Oswieci All church property in the Polish diocese of Gnezno and Pozn was officially confiscated by the German authorities.

The hierarchy of the United States in a statement issu Nov. 14 declared there could be no compromise with the ax The Bishops' War Emergency Relief committee distribut $1,322,493 for relief of prisoners of war and war sufferers. Co mander John J. Shea of the aircraft carrier "Wasp," sunk in t battle of the Solomons, wrote a final letter to his little s exhorting him to be a good Catholic and a good American. T letter was printed in newspapers throughout the United Stat In Great Britain the Bournemouth Union of Christian Thoug and Action, representing Catholics, Protestants and Jews, pr sented an irreducible minimum on which Christians would su port any political party.

Papal Official Acts.—In 1942, the pope approved the cau for the beatification of Margaret Sinclair, Scots working gi Steps were taken for the beatification of Kateri Tekakwith Louis Grignon de Montfort; Joanna Delanoue; Mother Fran Cabrini, U.S. citizen (canonization); Brother Andrew Bauer the Franciscan order, brother of a U.S. citizen. The cause w introduced on Dec. 21 for beatification of Princess Marie Clotil daughter of Victor Emmanuel II of Italy. On Nov. 28 the cau for beatification of Christians martyred in China during t Boxer uprising was approved. A papal rescript of July authorized the apostolic delegate to the United States to designa matrimonial courts to hear cases usually delegated to the Rom Rota. The Roman Rota heard 87 matrimonial cases during t judicial year. Out of the total, 29 decrees of nullity were grant In a majority of cases no fees were asked from applicants.

United States.—In the United States the following even took place in 1942: Bishop Crimont, S.J., vicar apostolic Alaska, celebrated his episcopal silver jubilee on July 29. V lanova College of the Augustinians celebrated the centenary its foundation on Sept. 20. Sisters of the Holy Family for Neg work celebrated their centenary at St. Louis on Nov. 21.

The National Evidence conference held its 11th annual c vention at Boston Aug. 23. The Catholic Biblical associat held its sixth general meeting at Cleveland Sept. 1–2. T Third Annual Liturgical Week was held at St. Meinrad's, In Oct. 12–16. The Catholic Press association's annual conventi is held at Birmingham, Ala., May 28–30. The Catholic Col- giate congress met at Cincinnati during the Christmas holidays r four-day sessions.

By a special papal privilege, Catholic chaplains with the United ates forces were allowed to celebrate mass in the evening for spiritual benefit of members of the services. The first evening ss was celebrated at Quantico, Va.

The Laetare medal was presented to Helen Constance White, thor. The Commander of Haitian Order of Honor and Merit nt to Mother M. Katharine Drexel, the DeSmet medal to . E. S. Murphy, the Mendel medal to Dr. Joseph A. Becher, Hoey medal for Interracial Justice to Frank A. Hall and ward LaSalle. Dr. Carlton J. H. Hayes of Columbia univer- y was appointed United States ambassador to Spain.

Missions.—Bishop Aerts of Dutch New Guinea and seven other ssionaries were massacred by Japanese soldiers July 13. Father nry Engberink, Father Arthur Duhamel, Sister Odilia and ter Sylvia of the Marist missionary order were murdered by panese soldiers on Guadalcanal island. United States Catholic ssionaries, both men and women, were still engaged on foreign ssions estimated to number about 2,693 in 1942. The total mber of Catholics in the African missions was 6,974,951. The pe appointed two Japanese priests to be bishops in Korea— her A. Hayasaka and Father Thomas Wakida. (*See* also THOLIC LIBRARY ASSOCIATION; PIUS XII; VATICAN CITY ATE.) (J. LaF.)

mmel, Erwin (1891–), German army officer, fought on the western front and the Italian front World War I. He joined the postwar Reichswehr and fought a storm-troop leader in the nazi party. He advanced rapidly the German army and his brilliant strategy and tactics in chanized warfare won him early recognition. In the battle France, Rommel's tank units smashed through the Maginot at Sedan in May 1940 and swept to the coast at Abbeville, sing a ring around 1,000,000 Allied soldiers in northern France Belgium. He was made commander of the German desert ces in 1940 to bolster the crumbling Italian armies in Libya. March 1941 he hurled Allied forces back across the Egyptian der and held a defense line near the Libya-Egypt border oughout the summer. The British struck again on Nov. 18, 1, with a large mechanized army, and Rommel fell back ond Bengasi, which was taken on Christmas day, 1941. In e 1942, Rommel destroyed a British tank force and then ad- ced to El Alamein in Egypt, 70 mi. from Alexandria. Four nths later, however, the British again struck back with such ngth that Rommel was compelled to retreat more than 1,000 from his original lines by the end of 1942.

His armies were reported to have been smashed almost beyond air.

osevelt, Franklin Delano (1882–), 32nd president of the United States, born Jan. 30, 1882 at Hyde Park, N.Y. (see *Encyclopædia tannica* for extended biography).

irection of America's war effort and the preparation, with ted Nations leaders, of plans to defeat the axis were the chief cern of President Roosevelt in 1942, commanding most of his e and energies.

n Jan. 6, in his annual message to congress, he called for a t arms program—185,000 planes, 120,000 tanks, 55,000 anti- raft guns, and 18,000,000 tons of shipping—to be completed r a two-year period at a cost of more than half the nation's ual income. Stressing the need for increased war production, president warned that "we must guard against complacency" and that "we must not underrate the enemy." Promising co-ordinated and co-operative action by the United Nations, the message declared that "our objectives are clear—smashing the militarism imposed by the war lords upon their enslaved peoples." The following day he submitted a budget of $58,927,000,000, for the fiscal year 1943, the bulk to be used for the war program.

On Feb. 2, the president asked congress to approve a $500,000,000 loan to China. On Feb. 9, he created a War Shipping administration, under the direction of Rear Admiral Emory S. Land. The same day he sent to the senate the nomination of Admiral William H. Standley, former chief of naval operations, as ambassador to Russia. In a radio address on Washington's birthday, he said that the damage inflicted by the Pearl Harbor attack was not as great as indicated by published reports, and declared that World War II differed from all other wars in which the country had been engaged, "not only in its methods and weapons, but in its geography."

On March 11, the president told congress that during the first year of lend-lease operations to the United Nations, military and other supplies valued at $2,570,552,441 had been shipped to allies of the U.S. "Lend-lease is now a prime mechanism through which the United Nations are pooling their entire resources," he explained. On March 28, he signed the second War Powers bill, which further widened the emergency authority vested in the chief executive in the first War Powers bill, enacted the preceding December. On March 29, he announced the creation of a Pacific War Council to sit in Washington. The council held its first meeting in April, with Mr. Roosevelt presiding. On April 3, he named Carlton J. Hayes, professor of history at Columbia, as ambassador to Spain.

As national income—estimated at $117,000,000,000 in 1942—continued to rise, and as the demands of war production progressively reduced the supplies of available civilian goods, administration leaders became increasingly concerned over the threat of inflation. Congress late in January had passed a price control act. Though signing the bill, Mr. Roosevelt sharply criticized the provision forbidding ceilings on farm prices below 110% of the parity price.

Despite this legislation, and other federal action, prices and living costs continued their upward trend, and it soon became evident that even more drastic measures would be needed to keep the nation's wartime economy on an even keel. On April 27, the president, in a special message to congress, proposed a seven-point program to combat inflation. This embraced (1) heavier taxes, (2) ceilings on prices, (3) wage stabilization, (4) control of prices for agricultural products, (5) increased buying of war bonds, (6) rationing of scarce essential commodities, and (7) a curtailment of installment buying. As part of his program, he also proposed a $25,000 limit on salaries, after payment of federal taxes.

The expansion in the armed forces, and the demands of war industries created widespread labour shortages in 1942. To study the problem, and apply corrective measures, the president, on April 18 established a War Manpower commission, headed by Federal Security Administrator Paul V. McNutt. On May 16, he ordered the release from prison of Earl Browder, Communist party leader, and on May 22 directed the registration of all men between the ages of 18 and 20.

On May 30, Soviet Foreign Minister Molotov arrived secretly in Washington for conferences with U.S. officials. On June 18, Prime Minister Churchill arrived in the United States to discuss with Mr. Roosevelt the war strategy of the United Nations.

On July 2, the president appointed a military commission, headed by Maj. Gen. Frank R. McCoy, to try eight nazi saboteurs,

PRESIDENT AND MRS. ROOSEVELT at the Detroit tank arsenal during his secret two-week inspection tour of the U.S. in Sept. 1942. At the left is Donald M. Nelson, chief of the War Production board

arrested by federal agents in June soon after they had landed on U.S. shores from an enemy submarine. Following a trial of several weeks behind closed doors at the Justice department, the judgment of the commission was approved by the president, and on Aug. 8, six of the saboteurs were executed in Washington. Of the others, one was sentenced to life, and the other to 30 years' imprisonment.

On August 6, the President vetoed a synthetic rubber bill sponsored by the congressional farm bloc, and appointed his own fact-finding committee headed by Bernard M. Baruch, to formulate a program to meet the emergency created by the growing rubber shortage. On Sept. 10, the committee reported that the situation was so dangerous that "unless corrective measures are taken immediately this country will face both a military and civilian collapse." Five days later William M. Jeffers was placed in charge of the nation's rubber program.

The spectre of inflation continued to menace the home front, and in a Labor day address on Sept. 7, the president asked congress to bolster the anti-inflation program, with new legislation to control farm prices and increase taxes, and promised to follow this with executive action to curb wage increases. The delay in enacting inflationary curbs had reached "the point of danger to our whole economy" he declared; telling congress that if it did not act by Oct. 1, he would accept the responsibility and take appropriate executive action to establish anti-inflation controls. Under the spur of the presidential whip, congress passed the anti-inflation bill, which was signed by Mr. Roosevelt on Oct. 2. The following day, he established the Office of Economic Stabilization, appointing as its director Associate Justice James F. Byrnes of the supreme court. He also ordered a $25,000 ceiling on salaries, after payment of federal taxes.

Late in September, the president embarked on an extended tour of the nation's war plants. Newspapers were requested to keep the tour a "secret," until its completion, as a means of better assuring the president's personal safety. Though the press obeye the request, made by the office of censorship, the secrecy rul brought a formal protest to Mr. Roosevelt from reporters assigne to cover the White House. In a radio address Oct. 12, reportin on the results of his trip, the president criticized "typewrite strategists," praised the "unbeatable spirit" of the U.S. peopl and reiterated that the war objective was to "destroy complete the military power of Germany, Italy and Japan."

On Nov. 8 (late Nov. 7 in the U.S.A.), the significance of th June strategy conferences between the president and Prim Minister Churchill was more fully revealed, with the announce ment of the landing of U.S. forces in North Africa. On Nov. 1 Mr. Roosevelt signed an amendment to the draft act lowerin the draft age from 20 to 18, a measure that had met with stron opposition. Taking cognizance of the opposition to Admiral Da lan, onetime collaborationist, as head of the civil government i North Africa, the president on Nov. 17 issued a statement tha the French alone would determine the form of their post-wa government.

On Dec. 4, the president ordered the abolition of the WPA and on Dec. 6 he named Secretary of Agriculture Claude F Wickard as food administrator. On Dec. 11, he told Congress tha more than 1,000,000 U.S. soldiers were serving outside the country

Following the adjournment of congress, the president devote most of his time to preparing his annual budget message fo presentation to the new congress. As the year ended, Mr. Roose velt and his aides gave increasing thought to the problems o rehabilitating the stricken lands of Europe, and post-war recon struction.

The health of the president, despite the great burden of direct ing the American war effort, remained good throughout the yea (*See* also UNITED STATES.) (O. McK.)

Rosenwald Fund, The Julius. The Rosenwald fund di fers from other large U ndations in that the trustees not only are permitted to spend ital as well as income at any time but are compelled to ex- d all its funds within 25 years of the death of its founder, t is, before Jan. 6, 1957. During the 25 years since its estab- ment in 1917 by Julius Rosenwald, this fund has expended roximately $18,000,000, being all of its income from year to r and about seven-eighths of its principal fund. At the close he fiscal year June 30, 1942, the assets of the fund (held fly in capital stock of Sears, Roebuck and Co. of Chicago) a value of approximately $2,500,000.

he chief program of the fund during its early years was aid in building of rural public schools for Negroes. The main pro- ns in 1942 were: (1) improving the content and quality of l education in both white and Negro schools in the south; (2) in building up four important centres of higher education for roes: Howard university in Washington, D.C., Atlanta uni- ity in Atlanta, Ga., Fisk university in Nashville, Tenn., and ard university in New Orleans, La.; (3) efforts in behalf of ro health; and (4) a series of fellowships for Negroes and white southerners.

uring the year 1941–42 the fund expended $575,000 upon e and related programs.

tary International.

On Dec. 15, 1942, there were 5,105 Rotary clubs in more than ountries of the world, with a membership in excess of 205,000. ers for the fiscal year 1942–43 were: president, Fernando ajal, Lima, Peru; vice-presidents, J. Raymond Tiffany, oken, N.J., U.S.A.; C. J. Steiger, Zurich, Switzerland; Ar- do Hamel, Santiago, Chile; secretary, Philip Lovejoy, Chi- , Ill., U.S.A.; treasurer, Rufus F. Chapin, Chicago, Ill., A. Headquarters in Chicago, Ill.; additional offices in Lon- England; Zurich, Switzerland; and Bombay, India. During Rotary activities included general community betterment rtakings, work for crippled children and underprivileged chil- , the establishment and supervision of camps and clubs for and girls, assistance to students through scholarships and ent loan funds, and the promotion of high ethical standards in esses and professions. In addition, Rotary clubs actively co- ated with their governments in rationing, salvaging and fund- g campaigns, in all phases of civilian defense, and in activi- for the alleviation of war suffering. In the U.S.A. 150 itutes of International Understanding" were sponsored by ry clubs, presenting to community forums and to high- l audiences outstanding speakers on vital world problems. teen weekly radio programs called "The Americas Speak" presented by the Rotary clubs of the Americas as a contri- n to international friendship and understanding. The 33rd al convention of Rotary International was held in Toronto, da, June 21 to 25, 1942. The official Rotary magazine is *Rotarian,* which has a Spanish edition, *Revista Rotaria.* In ion, there are numerous regional Rotary magazines published ghout the world in several different languages. (P. Ly.)

ving.

The 1942 intercollegiate rowing season opened in the United States on April 1 with a race between ers and Princeton on Lake Carnegie at Princeton, N.J. By margin of one length and for the first time, Rutgers defeated eton.

the following Saturday the two western crews, Washington California, met on Lake Washington at Seattle for the 39th al west coast championship regatta. Washington rowed to mplete victory over the California shells, winning all three races and establishing new course records in each event. The varsity crew won by three lengths in 15:54 over the three-mile Leschi-Madison park course, the junior varsity by only a few feet in 15:55, and the freshmen won the two-mile event in 10:20.5. Navy, with an inexperienced but powerful crew, gave Princeton its second defeat of the season. Rowing against a strong head wind that caused whitecaps on the usually calm surface of Lake Carnegie, Navy took an early lead and finished a length ahead in the mile-and-three-quarters race. The Princeton junior varsity crossed the line four lengths in front of the Navy second boat. On the same day the Columbia varsity crews won in close races over Rutgers on the Harlem river in New York.

On April 25 the balance of the eastern crews went into action. The largest of the three regattas held on this day was for the Rowe Cup at Cambridge over the Henley distance on the Charles river basin. Harvard nosed out Cornell by a deck length, with Syracuse, Massachusetts Institute of Technology and Boston university trailing in that order. Cornell took the junior varsity race and Harvard the freshman. At Annapolis the Navy varsity and plebe crews had everything their own way over Columbia. Rutgers won its second victory of the year by defeating a green University of Pennsylvania eight by a length on the Schuylkill river at Philadelphia, Pa.

The Blackwell Cup regatta was held on the Housatonic river near Derby, Conn., on May 2. Yale won the varsity race over Pennsylvania by about three lengths, with Columbia last. Pennsylvania was the victor in all three of the preliminary races, with Yale second. The Naval academy varsity proved itself to be one of the best in the east on this same Saturday by taking a gruelling race from Cornell by one-eighth length on the Severn river. The heavily-favoured Harvard crews won all three races in the Compton Cup regatta at Princeton over the mile-and-three-quarters course to write their name on the cup for the sixth straight time. Princeton took second in each event, with Syracuse, an added starter and not competing for the cup, in third place, with M.I.T. last.

Four regattas were held on May 9. On the Harlem river, Pennsylvania, revamped after their defeat of the week before, staved off Princeton's last-minute challenge to win the Childs Cup by a margin of about four feet. Columbia, the third starter, was last. Princeton took the honours in the junior varsity and freshman races. At Ithaca, N.Y., Cornell, beaten by Harvard and Navy by only a few feet in early races, won its first victory of the year in a clean sweep over three Syracuse crews at two miles. The Dad Vail regatta was held on the Henley course in the Charles river basin with Rutgers, Boston university, American International and Dartmouth finishing in that order. Harvard's 150-lb. crew retained possession of the Goldthwaite cup when it defeated Princeton and Yale by a length on Lake Carnegie.

On May 16 at Derby a Princeton eight that had lost all of its previous races rowed to a surprising victory over Cornell and Yale to win major honours in the Carnegie Cup regatta. Cornell finished three-quarters of a length back of Princeton and the same amount in front of Yale. The Cornell junior varsity and freshman crews won their races easily. The year's only intersectional race took place at Cambridge on the same day. For almost a mile of the mile-and-three-quarters course, Harvard, Wisconsin, Navy, M.I.T. and Pennsylvania rowed on even terms in the race for the Adams Cup. In the final drive for the finish line, Harvard pulled out to a two-lengths win over a big Wisconsin crew that was only two feet in front of Navy. The undefeated Harvard freshmen won their event while Pennsylvania was first in the junior varsity race. Syracuse won its final race of the year by defeating Columbia on the Harlem river. The Princeton 150-lb. crew set a new course record of 6:40.8 for the

Henley distance on Lake Carnegie to win the Joe Wright cup for lightweight crews. Pennsylvania and Harvard were only a few feet back of the winner to take second and third place; Cornell, Columbia and M.I.T. finished several lengths back of the leaders.

Due to the naval activity on the Thames river at New London, the Harvard-Yale regatta was rowed over the two-mile Housatonic river course near Derby, Conn., on May 23. Harvard again showed its rowing supremacy over Yale by impressive victories in varsity, junior varsity and freshman races.

The annual Poughkeepsie regatta, usually held in June, was cancelled for the second time in its history because of war.

Harvard's fine varsity and freshman eights were the only eastern crews to remain undefeated for the entire season and the University of Washington crews were still champions on the west coast. (E. O. Le.)

Ruanda and Urundi: *see* Belgian Colonial Empire; Mandates.

Rubber and Rubber Manufacture.

As never before the importance of rubber both to military and civilian pursuits was impressed on the people of the world during the year 1942. Never before did so many in the United States know how much rubber was imported nor how much the requirements would change because of the war. Synthetic rubber was discussed at length in the daily press and by radio commentators.

Notwithstanding all this publicity concerning the general features of the rubber situation, but little information concerning technical advances in the industry was published. The patent office, for example, withheld issuance of all patents considered by military authorities to disclose information of possible importance to the enemy; manufacturers were refused permission to publish descriptions of many of the new products developed for the army or the navy and papers planned for presentation at meetings of scientific societies were deleted from the programs because of the war. Nevertheless, it is possible to outline in general terms the fields of development in the rubber situation during the year.

Federal Organization.—Immediately after their attack on Pearl Harbor, the Japanese invaded the rubber-producing countries of the far east and soon seized control of all but a sm per cent of the world's sources of this vital material. Fortunat the Rubber Reserve corporation accumulated during 1941 a la stock of crude rubber and this was available for the manufact during 1942 of the vastly increased variety and quantity of ru ber products needed for war equipment and for the continuan of essential industrial operations. It became evident that all m ters relating to the securing and utilizing of rubber should directed from one source and, in accordance with recommend tions of the so-called Baruch committee appointed by the pre dent to investigate the rubber situation, control of all rub problems was placed under the direction of a rubber administrat

Conservation.—Conservation policies both for crude rub and for the vast amount in the form of finished goods we established. Production of non-essential products was stopp and crude rubber was allocated to each manufacturer for defin purposes. This control extended to rubber latex as well as c rubber and later to reclaimed rubber. The useful life of the m lions of automobile tires was extended by the indirect means limiting the amount of gasoline each vehicle might use and compelling each motorist to sell, in accordance with governme regulations, all tires in excess of five for each vehicle in orc that these might be reconditioned for service and later ration to vehicles employed in promoting the war effort. Those unfit repair were to be converted into reclaimed rubber suitable for t manufacture of retreading material or of new tires of infer quality but useful at limited loads and speeds. In many ca studies by government groups led to the substitution for spec requirements of more readily available materials in place of ru ber. Many of these replacements were undoubtedly tempora but in a few instances no disadvantage resulted from the chang and, if economical, they might be permanently adopted. In the various ways the program of conservation was promoted.

Reclaimed Rubber.—Manufacturers of rubber goods report that reclaimed rubber judiciously used would help to increase t amount of crude available for applications where nothing e would serve, and a scrap drive for old rubber, conducted by sch children throughout the United States, resulted in the collecti of much greater amounts than had been anticipated. Reclaim rubber from this scrap was being used wherever it would impa sufficiently good quality.

NEOPRENE fabric replaced rubber during 1942 in U.S. barrage balloons

FORMULAS FOR PRODUCING SYNTHETIC RUBBER
DELIVERY
DANIEL BISHOP

ɔN'T SOMEBODY INVENT A NEW FAUCET?" A view of U.S. confusion in s for producing synthetic rubber in 1942, by Bishop of the *St. Louis Star-ies*

latural Rubber.—Rubber from natural sources outside Jap- se-controlled areas was sought to reduce the rate of shrinkage the stock amassed by the Rubber Reserve corporation. To end the federal government made arrangements with prac- lly all Central and South American governments in whose ter- ry rubber-bearing trees suitable for commercial production existed to resume extraction of rubber from these regions ; since abandoned as rubber producing areas. Some of these ded rubber during 1942 and were expected to turn out still e in 1943.

second development in this direction was the study and ex- sion of plantings of rubber-bearing plants vigorously pursued ing the year. Guayule, rabbit brush, golden rod, cryptostegia other plants already existing in the western hemisphere, as as kok-sagyz, a species of dandelion recently imported from sia, have all been exploited. Remarkable progress has been le with some of these, notably guayule, but substantial ounts of rubber cannot be expected from these sources for a years to come. Guayule rubber has been found to improve processing of synthetic rubber when blended with it in mod- e proportions.

ynthetic Rubbers.—Most important of all sources of rubber the immediate future was the manufacture of synthetic rub- The variety selected for general use was the butadiene- ene type and the government plan contemplated erection both lants for producing the raw materials and of others for con- ing these into synthetic rubber.

he raw materials were to be produced by petroleum refiners chemical manufacturers and the polymerization to rubber was e under the supervision of the largest rubber manufacturing orations of the country. In addition to an output capacity 00,000 tons a year by Oct. 1943, of the butadiene variety, lities for 132,000 tons of butyl rubber, 40,000 tons of neoprene, 30,000 tons of thiokol per year were expected to be com- ed by that time also.

lanufacturing Operations.—Much work had to be carried in order to ascertain how best to process the new synthetic butadiene rubber, how to design its compositions and the products into which it was to be incorporated. As soon as it began to be produced, sufficient was made available to suppliers of materials to the rubber industry for experimental examination, and during 1942 many studies were made to ascertain the effects produced by various pigments, softeners, extenders and other ingredients. Committees of technicians in the employ of rubber manufacturers and suppliers were actively working with government agencies to ascertain for the benefit of the industry as a whole how the synthetic rubber might best be processed, to compile the results produced by various compounding ingredients and outline the principles of designing articles in order to meet the rigid requirements of the army, navy and other governmental branches.

Products.—War products dominated the attention of rubber manufacturers. Many were not publicized but others were mentioned by manufacturers in their advertising. Principal of these were vibration insulators for supporting instruments on planes and tanks, pontons, boats, life rafts, crash pads and bullet sealing fuel cells. Notable developments of articles for civilian consumption were noticeably absent. (*See* also BUSINESS REVIEW; CHEMURGY; RATIONING; WAR PRODUCTION, U.S.) (J. W. Sc.)

Ruckstull, Frederick Wellington

(1853–1942), U.S. sculptor, was born May 22 in Breitenbach, Alsace, and was taken to the United States as a child. He studied art in Paris, where he won honourable mention in the salon of 1888. Among his principal works are "Evening," a female figure in marble at the Metropolitan museum, New York city; "Wisdom" and "Force," two seated figures of marble, New York; "Phoenicia," marble façade on the customs house, New York; "Mercury Amusing Himself," bronze group, St. Louis; "Franklin," "Goethe" and "Macaulay," granite heads on the façade of the Library of Congress, Washington, D.C., and an equestrian statue of Brig. Gen. John F. Hartranft, Capitol Hill, Harrisburg, Pa. Ruckstull was also an art critic, editor of *The Art World,* and author of *The Great Works of Art and What Makes Them Great* (1925). He died in New York city, May 26.

Ruff, Robert Hamric

(1887–1942), U.S. college president, was born July 27 in Chester, Miss. After receiving his B.A. and M.A. from Millsaps college, Jackson, Miss., and a B.D. from Emory university, Atlanta, he was ordained to the ministry of the Methodist Episcopal Church, South, in 1915. He was a leader in the church during the following decade, later serving as president of Morris Harvey college, Barboursville, W.Va., 1927–29. He was also president of Central college, Fayette, Mo., 1930–41. He died in Fayette, May 5.

Rugby: *see* FOOTBALL: *Great Britain.*

Rugh, James Torrance

(1867?–1942), U.S. orthopaedist, was born in western Pennsylvania and was a graduate of Adrian college and Jefferson Medical college. He was staff member of several Philadelphia hospitals as well as professor of orthopaedic surgery at Jefferson. Dr. Rugh joined the U.S. army medical corps in World War I, and served as supervisor of orthopaedic surgery at army camps in the south. Later he was assigned to duty in the surgeon general's office and in 1918 was made lieutenant colonel and senior consulting orthopaedic surgeon to all the camps and base hospitals. He was credited with having established standardization of orthopaedic surgery and prophylactic treatment. Dr. Rugh died in Cynwyd, Pa., Oct. 12.

Rulers: *see* PRESIDENTS, SOVEREIGNS AND RULERS.

Rumania. A kingdom in southeastern Europe. Area on Jan. 1, 1941 *c.* 74,000 sq. mi.; pop. *c.* 16,000,000. Capital, Bucharest. Principal cities: Bucharest (648,162); Yassy (104,471); Galatz (102,232); Timisoara (89,872). Religion, mostly Greek Orthodox. King: Michael (Mihai); prime minister (1942): Gen. Ion Antonescu (*q.v.*).

History.—The dictatorship of Gen. Ion Antonescu which was established at the abdication of King Carol on Sept. 6, 1940, according to which Antonescu became Conducator (leader) of a National Legionary state, did not bring any lasting order. The different elements which had joined to form the dictatorship continued in 1942 to fight bitter internal wars. In 1940 Rumania had lost the southern Dobruja to Bulgaria, northern Transylvania to Hungary, and Bessarabia and northern Bukovina to the soviet union. In 1941 Rumania, having joined Germany in the war against the Soviet Union, reconquered Bessarabia and northern Bukovina, and beyond that a territory of about 16,000 sq.mi. between the Dniester and the Bug rivers, with Odessa which was named Transnistria and put under Prof. Alexianu as governor. The territory of Rumania as it existed on Jan. 1, 1941 was divided into 11 provinces, of which 7 were organized in the territory of old Rumania, as it had existed in 1914, 1 in the Banat and 3 in southern Transylvania. Each province was divided into four districts. The territories conquered from the soviet union in the summer and fall of 1941 were put under a special form of administration, the task of which was the gradual transformation and adaptation of the economic system.

Of all the satellite states of the axis, Rumania was probably more closely under direct German control than any other. Not only the Rumanian army but the whole economic life of the nation was strictly co-ordinated to Germany's needs. A large number of German officers, training specialists and technicians coordinated Rumania's army. In Feb. 1942 Marshal Antonescu visited Germany, where he conferred with Chancellor Hitler, foreign minister von Ribbentrop, Marshal Wilhelm Keitel and Marshal Hermann Goering on questions of political, military and economic co-ordination. During his absence Deputy Premier Mihail Antonescu represented the premier in the government of the country.

In spite of the iron rule of the dictatorship, opposition was strong within Rumania, from two different sources. One was the extremist Rumanian youth, the supporters of the Iron Guard, whose last great revolt had been suppressed at the end of Jan. 1941; the other was the democratic peasant party around Julius Maniu, who insisted on regaining northern Transylvania and on a "western orientation" against Antonescu's expansion eastward. Throughout 1942 many arrests were made. All persons found possessing fire arms or explosives after Jan. 20 were threatened with the death sentence. This decree was aimed also at demobilized soldiers. Among the many men arrested and sentenced, there were on the one hand young students, on the other hand personalities of high Rumanian society, among them the former minister of propaganda, Eugene Titeanu, Radu Lobei, secretary of the former premier Armand Calinescu, and George Deoharl, former deputy mayor of Bucharest. The unrest in the country was increased by the great rise in prices. From Aug. 1939 to Jan. 1942 the increase averaged 300% and even the domestic food stuffs rose about 200%. In spite of the great initial successes, the war grew less and less popular after the hardships of the winter of 1942 and the very great sacrifices to which the Rumanian troops were exposed before Stalingrad and in the Caucasus. The war demanded an ever increasing participation of the Rumanian army, much against the expectations of leading Rumanian circles responsible for Rumania's subservience to the axis, and it was believed that the German army command was using Rumanian troops at specially dangerous positions. The vigorous Russian counteroffensive and the British successes in North Africa in the last two months of 1942 increased the feeling of apprehension In June 1942 a small number of United States Liberator bombers flew over Rumania to raid the oil fields of Ploesti.

Some Rumanians abroad tried to organize a "Free Rumania" movement. In the United States Charles Davila, the former Rumanian minister in Washington, was at the head of a democratic movement of Rumanians. Attempts by former king Carol, who was living in Mexico, to go to the United States and organize a movement on the side of the United Nations were turned down by the U.S. department of state and were opposed by Rumanian democrats.

The most important issue of Rumanian foreign policy was her relations with Hungary. These relations were extremely strained on account of northern Transylvania, which the axis had given to Hungary in 1940. Julius Maniu, leader of the peasant party, and Constantin Bratianu, leader of the old liberals, signed on Jan. 2 a memorandum to Marshal Antonescu in which they demanded renewed efforts for the re-incorporation of Transylvania. On Feb. 22 Maniu sent another letter to vice premier Mihail Antonescu, and the text of the letter was also made public by leaflets. As a result Mihail Antonescu delivered on March 19 an address in the crowded assembly hall of the Bucharest law faculty where among the cheers and shouts of "give us back Transylvania!" he declared that the Rumanian army had been insulted by words and in writing in a way incompatible with its position and its dignity. "Let the whole world remember," he warned, "if the Rumanian knows how to hold love in his heart, he also knows how to hate." He spoke of the relations with Hungary as a "truce" which would be respected only as long as Hungary respected it. Thus an open split, and even a war, between two important axis satellites seemed threatening. Antonescu called northern Transylvania "the cradle of our fatherland" which was subject to a regime of oppression, humiliation and discrimination. "Its population has been offended and tortured, its churches were destroyed, and the peasants were deprived of their holdings which they had received thanks to the social justice of Rumania." He emphasized that all Rumanians thought always with greatest sympathy of their brethren suffering under the Hungarian yoke The Rumanian vice premier, who was also acting foreign minister, rejected Hungary's claims of dominating the Danubian basin. Rumania tried a rapprochement with Slovakia and Croatia to check Hungary's aspirations. Only with greatest difficulty did Germany succeed in maintaining the "truce" between Rumania and Hungary, pointing out that a final decision could be taken only after a successful conclusion of World War II.

Agriculture, Minerals and Trade.—Rumania is predominantly an agricultural country. The few industries which exist, like flour milling, brewing and distilling, are directly connected with agriculture. The chief crops of the country are maize, wheat, barley rye and oats. The principal minerals are petroleum and natural gas, iron and copper ores, salt and lignite. The output of crude oil amounted in 1938 to 6,610,000 metric tons, and in 1939–40 to 4,527,204 metric tons, the output of natural gas in 1937 to 1,760,595,424 cubic metres; 1,390,000 tons of petroleum were exported in 1940 as against 2,790,000 in 1939.

The total imports in 1938 amounted to 18,767,000,000 lei, the exports to 21,532,000,000 lei. The chief importers were Germany, Czechoslovakia, Great Britain, France and Italy, the chief exporters Germany, Great Britain, Czechoslovakia, Italy and France. The monetary unit is the leu, valued at 47 cents U.S. in 1940. (*See* also WORLD WAR II.) (H. Ko.)

ndstedt, Karl Rudolf Gerd von (1875–), German army officer, born Dec. 12 at Aschersleben, descendant of a noble family Brandenburg. He served in Alsace and Poland during World I and acquired military fame in 1939 during the Polish camn. He was in command at the fall of Cracow, Lodz and emysl. The battles of the river San and the bend of the ula, and the entry into Warsaw were further milestones in . Rundstedt's career. For these accomplishments and for his esses during the invasion of the Low Countries and France 940 he was created marshal of the reich July 19, 1940. Rundt was in command of the southern group of German armies he Russian campaign of 1941, and it was against his forces the Russians first began their counter-offensive, at Rostov in November. The Germans' rout from that city was their major defeat of World War II.

undstedt was shifted to France in 1942 where, on April 16, he put in charge of German defenses along the Atlantic coast. then directed the German armies that occupied all France on . 11, 1942. On Nov. 27, after the scuttling of the French in Toulon, Hitler announced that Rundstedt would have ary rule over all France.

al Electrification. The electrification of rural areas in the United States, which reed its impetus in 1935 with the establishment of the Rural trification Administration, continued in 1942 at a reduced because of the impact of war and the shortage of critical erials for new line construction. During the year increased hasis was placed on the utilization of electric power to inse food production and to alleviate growing rural labour short. The estimated number of farms receiving central station ce was 2,400,000 on Dec. 31, about 39% of the total, in parison with approximately 2,250,000, or 37%, at the end 941.

he growth in rural electrification in recent years is shown by approximate number and percentage of electrified farms at end of each year as follows: 1934, 744,000 farms, 10.9%; , 789,000 farms, 11.6%; 1936, 1,043,000 farms, 15.4%; , 1,242,000 farms, 18.2%; 1938, 1,407,000 farms, 20.5%; , 1,786,000 farms, 27.8%; 1940, 2,060,000 farms, 33.8%. r to 1935 rural electrification was almost entirely controlled rivate utility companies; after 1935, rural electric, nonprofit peratives were organized and by the end of 1942 were serving tly over 1,000,000 consumers. More than 92% of the Fed rural electrification loans were made to these quasi-public perative enterprises which were essentially communityed and operated businesses.

y the end of 1942 Rural Electrification administration had ted $461,000,000 to 873 borrowers to finance on a selfdating basis the construction of nearly 410,000 mi. of distrion lines and other electric facilities to serve nearly 1,350,000 consumers. At the close of the year, 796 systems had in ation 378,000 mi. of line serving over 1,000,000 consumers in parison with 347,000 mi. serving 900,000 consumers at the of 1941. Approximately 80% of the consumers were farms; balance consisted of industrial and commercial enterprises and nunity institutions. During 1942 the rural electric coatives made notable advances toward more stable operations as indicated by payments in advance of due date of about 00,000 on their debts to the government in contrast to overamounts of $205,000 at the year end.

ar and Rural Electrification.—Rural electric service ased an added significance during 1942 as a result of the war s for food. Electric power was utilized widely in the production of vital foods, particularly milk, poultry and livestock, and in the processing and preservation of foodstuffs. Further, it was being employed on an extensive basis to replace rural manpower lost to military services and war factories. Many essential war activities such as military establishments, air beacons, mines and industrial plants located in rural areas were dependent on electric service for their operation.

The more intensive use of power in rural areas during 1942, in part as a reflection of war demands, was indicated by a 57% increase over the previous year in energy sold by REA-financed systems. Wider application of electric power to farm operations continued to receive considerable attention of research agencies and others although many new developments in electrical farm equipment were not manufactured because materials were not made available. To meet their need for equipment for food production there was an active interest in homemade equipment and many farmers were making items of electrical equipment that were no longer available in the markets, including dehydrators for preserving fruits and vegetables, stock tank heaters, and brooders for chickens and pigs to prevent loss of stock.

(R. B. C.)

Russell Sage Foundation. The Russell Sage foundation was established in 1907 by Mrs. Russell Sage, for the purpose of improving social and living conditions in the United States of America, with an endowment of $15,000,000. In carrying out its purpose the foundation conducts studies aimed through public education to help in correcting adverse living conditions on the one hand and in promoting healthful and helpful conditions on the other. More than 60% of its income in 1942 was devoted to work carried on by its own staff; the remainder was granted to endeavours which seemed likely to be carried on with greater economy by other agencies.

The foundation had published more than 100 books and 200 pamphlets by 1942.

The offices of the foundation are at 130 East 22nd street, New York city. (S. M. Ha.)

Russia: *see* Union of Soviet Socialist Republics.

Russian Literature. Several leading novelists, including Alexei Tolstoy and Ehrenburg, collected their war articles and sketches in book form. At the close of 1942 no major work of lasting literary value seemed to have emerged from this welter of documentation. But there were attempts to picture the war in verse (one of the best was Tikhonov's poem about the 28 heroic guardsmen of the Panfilov division), in drama (Korneychuk's rather conventional and lifeless *Guerrillas in the Steppes of the Ukraine,* Simonov's *Russian People* and *Boy from Our Town*) and in short stories (Tikhonov's stories of besieged Leningrad and many others). In most of the stories dealing with the war the predominant subject was the heroism of ordinary Russian people, whether soldiers or civilians, the "simplicity of life and death," that "sacred simplicity" (to use Tikhonov's words) which is "simpler than any complex truths."

Apart from the war itself, the pride of place in contemporary Russian fiction belonged to historical subjects. Never was there such a glorying in the traditions and achievements of the past, and especially in the great deeds of the Russian army as embodied in such figures as Suvorov and Kutusov, or—to go much further back—in Alexander Nevski and Dmitry Donskoi. The taboo was lifted even from World War I, hitherto officially considered, in keeping with Lenin's view, as purely "imperialistic." Among the works for which Stalin literary prizes for 1941 were awarded were two historical novels—Sergei Borodin's *Dmitry Donskoi* and V.

Yan's (V. Yanchevetsky's) *Chingis Khan* (planned as a trilogy, the second instalment of which appeared later under the title of *Batu.*) A. Tolstoy was engaged on a play about John the Dread. The words of a soviet critic reviewing Borodin's novel—"In our days the remote history of Russia is being read afresh"—characterized well the new prevailing attitude.

Besides Borodin and Yan, other recipients of Stalin prizes for literature were Ilya Ehrenburg (for his novel *The Fall of Paris*), K. Simonov (for his play *Boy from Our Town*), A. Korneychuk (for his play *In the Steppes of the Ukraine*) and N. Tikhonov (for his poem *Kirov Is with Us*).

A. Afinogenov, the author of *Fear, Distant Point* and other plays, was killed during an air raid on Moscow while fire-watching. E. Petrov, *nom de plume* of Evgeny Petrovich Katayev, the author, with Ilya Ilf (who died in 1940), of two very successful picaresque novels (*Twelve Chairs* and *The Little Golden Calf*, both translated into English), a book of travelling impressions *One-storied America,* and a number of short stories and sketches, died "at his post," in Sevastopol in April 1942 while covering the siege for the Soviet Information bureau.

The émigré Russian literature as an independent force could not recover from the blow dealt to it by the war. Most of its leading representatives were apparently still in France, though a few (Aldanov, Nabokov-Sirin) found refuge in the United States. Nabokov-Sirin published in America his first novel written in English. Whether he was now lost to Russian literature remained to be seen. No other publications of émigré writers came to notice. (G. St.)

Ryder, Charles W.

(1892–), U.S. army officer, was born Jan. 16 in Kansas. After graduating from West Point, 1915, he was commissioned a 2nd lieutenant. During World War I he fought on the western front, was cited for extraordinary heroism and was awarded a number of decorations. After the war he was stationed in China and served for awhile in military intelligence. One of the commanders of the U.S. armies that landed in French North Africa on Nov. 8, 1942, Maj. Gen. Ryder led the force that landed at Algiers. His army met little resistance, and 16 hours after the initial landings he negotiated surrender terms with the French garrison commander. After the occupation of all French North Africa, Gen. Ryder's armies were associated with the British 1st army, led by Gen. K. A. N. Anderson in the offensive against the axis armies in Tunisia.

Rye.

The 1942 crop of rye in the United States yielded at the rate of 14.9 bu. per ac., a production that has been equalled only once previously, in 1922. The crop was estimated by the department of agriculture at 57,341,000 bu. from 3,837,000 ac. The 1941 crop was 45,364,000 bu. from 3,570,000 ac.; the ten-year (1930–39) average, 37,870,000 bu. from 3,298,000 ac. The yield in 1941 was 12.7 bu. per ac.; the ten-year average, 11.1 bu. per ac. The Canadian crop in 1942 was 24,703,000 bu. (second official estimate Nov. 13) compared with 11,659,000 b in 1941. (S. O. R.)

St. Louis.

Eighth largest city of the United States, St. Lou Mo., had a population of 816,048 by the fede census of 1940, with an additional 541,567 persons living with the greater metropolitan district. Mayor (Jan. 1, 1943): Willia Dee Becker (Rep.).

Central location, minimum vulnerability to enemy attack a access to labour, fuel and raw materials made St. Louis a fo point for war industries in 1942. Largely as a consequence, t population of the greater metropolitan area had increased 97,0 since the last decennial census, the U.S. census bureau estimat The attendant boom increased bank clearings 15%, departme store sales 11%, and railroad freight through the St. Louis ma ket 35%. The city's mass transportation system, long in financ doldrums, showed a net profit of $1,348,841 during the first t months of 1942, with passenger revenue 32% above the cor sponding period of 1941.

Politically, the Republican party expanded its hold on ci offices in the Nov. 1942 election to the near exclusion of t Democrats, who had reigned from 1933 until the 1941 electic Made operative Sept. 15, 1942, after much controversy and test suit, was the civil service system which St. Louisans a ye earlier had voted into the city charter. There was more dallian with an Aldermanic resolution requiring the redistricting of t city's 28 wards to equalize their size, and by the end of 19 (after 18 months) little progress had been made.

At the beginning of the 1942–43 fiscal year (April 1942) t city deficit was $651,853.20 (lowest since 1934); indebtedne $62,838,000; assessed valuation of all property, $1,045,348,68 and the tax rate (including state and school), $2.77.

In the field of sport, the St. Louis Cardinals brought to t city the world baseball championship. (E. L. R.)

Salazar, António de Oliveira

(1889–), Port guese statesman, w born at Santa Comba Dão (Coimbra) on April 28, 1889. Train for the church, he decided later on an academic career and in 19 became professor of economics at Coimbra university. Short after the revolution of May 1926, the Portuguese president, Ge eral Carmona, invited him to join the government as finan minister; he accepted the post, but, finding himself unduly r stricted, resigned within a week. Less than two years later, oth means of redressing the country's finances having failed, he w approached again, and, after stipulating that complete freedo within his department should be given him, reassumed office April 27, 1928.

In 1930 Dr. Salazar founded the civil organization known as National Union. On July 5, 1932, he became president of council of ministers; in the following year the new corporat onstitution of the Portuguese republic was submitted to the counry in a plebiscite and a national assembly elected. In 1936 Dr. alazar assumed the portfolios of war and foreign affairs, which e retained through 1942. (E. A. P.)

The production of salt in the United States in 1941 increased 23% over 1940, to 12,720,629 short tons, while onsumption showed the same increase, to 12,619,025 tons; of e total 53% was in the form of brine, 26% in evaporated salt, nd 21% in rock salt. Purely industrial uses took 70% of the otal, while the food industry and table use accounted for 17%.

In Canada the 1941 output was 560,845 short tons, 21% more an in 1940, while that of the first seven months of 1942 was 4% greater than for the same period of 1940. (G. A. Ro.)

alvador, El.

The smallest of the Central American republics and the only one without a Caribbean littoral. rea, including islands, 13,176 sq.mi. Pop. (official est. June 941): 1,811,036, the densest per sq.mi. in Central America. apital, San Salvador (106,000). Other cities: Santa Ana (85,00); San Miguel (44,000); Santa Tecla (33,000). Language: panish; religion: Roman Catholic. President in 1942: Gen. aximiliano Hernández Martínez.

History.—El Salvador, at war with the axis nations, enacted e usual legislation to control enemy alien property and activities. ost-favoured-nation treaties with Germany and Italy had been ncelled Dec. 15, 1941. A state of siege, declared with the start the war, was extended in March, again in June, and once more Sept. 1942. In February arrangements were made with the nited States to secure additional arms for defense. Shortages essential materials—nails, newsprint, steel wire, tools, etc.—ecessitated early extension of government control over many mmodities through the establishment of an Economic Codination board. The movement of United States currency was ohibited to prevent its use in subversive activities.

Education.—In 1941 primary schools numbered some 1,300, d secondary schools about 45. Education was allotted 2,211,000 lones in the 1942 budget.

Defense.—In normal times the regular army numbers 3,000, th a national guard of 1,900. Defense was assigned 3,664,000 lones in the 1942 budget.

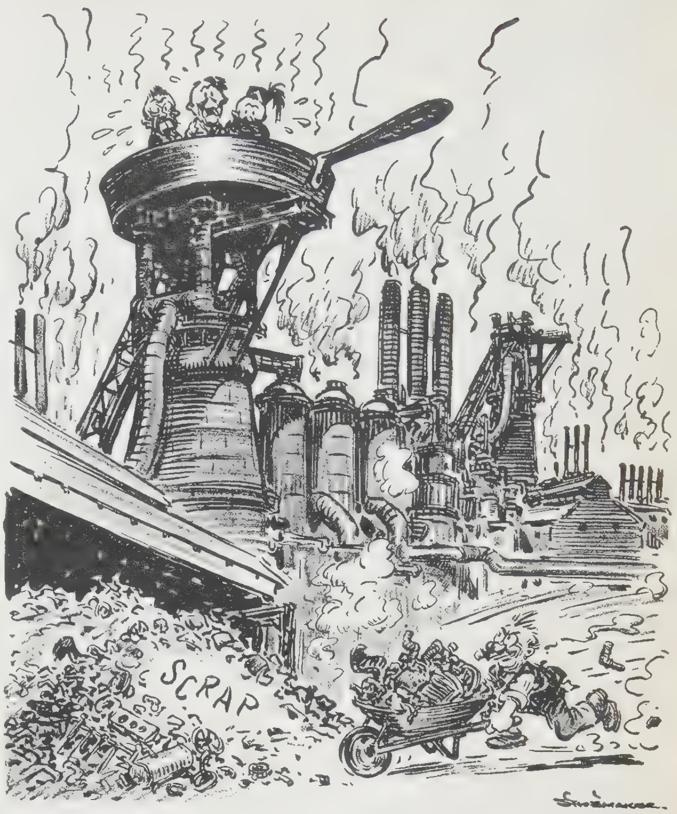
Finance.—The monetary unit is the colón (value: 40 cents S. in 1942). The 1942 budget estimated revenue at 23,723,000 lones and expenditures at 23,721,000 colones. The public debt ay 31, 1942) was 44,091,000 colones (external: 38,917,000; ernal: 5,174,000).

Trade.—For the first half of 1942, trade totalled 27,415,804 lones in value (imports: 9,322,479; exports: 18,093,325). offee, normally 90% of El Salvador's exports, was limited to a ota of 79,200,000 lb. (later raised to 80,700,000 lb.) by the ter-American Coffee Conference. The cotton crop was reduced rough damage by locusts.

Communication.—Communication by sea was curtailed by e war. Railroad mileage (1942) was estimated as 375 mi. ghways totalled some 3,700 mi., of which 1,600 mi. were unproved. Highway expenditure for the year ending June 1942 s $669,852.

Bibliography.—Dana G. Munro, *The Five Republics of Central America* (918); Chester Lloyd Jones, *The Caribbean since 1900* (1936); C. D. pner, *Social Aspects of the Banana Industry* (1936). (D. Rd.)

lvage Drives, U.S.



"KEEP 'EM FRYING." Shoemaker's portrayal in *The Chicago Daily News* of the U.S. scrap metal drives of 1942

Soon after the United States entered World War II, it became apparent that the nation had to change several of its wasteful ways or risk a dangerous shortage of raw materials vital for the manufacture of fighting equipment. More than 90% of the U.S. tin supply had come from Malaya. Scrap metal, which comprised about 50% of steel, was going to war overseas and not coming back. In time, normal scrap sources were sure to dry up. In fact, during the winter of 1941–42—under the pressure of greatly increased production—more than 40 steel mills were forced to close down temporarily for lack of scrap.

The first steps in action that was to change the nation's scrap habits were taken early in 1942 by the War Production board. Its conservation division secured skilled men from business and industry. These men trained those who were sent into the field after the scrap. Communities, cities and states were organized and a huge new activity was born—*salvage for war.*

Early in Sept. 1942, when scrap was beginning to be an old story to most of the country, Donald Nelson called the newspaper publishers together and asked them to make it a new story with a nation-wide "punch." In only a few days, 1,800 dailies and 10,000 weeklies went into action.

The results were spectacular and effective. In three weeks about 5,000,000 tons of metal were placed on the United States' scrap piles. People in home and industry found their interest stimulated, their understanding of the continuous need for scrap clarified. When 1942 figures were totalled, the nation had dug up more than 30,000,000 tons of scrap metal—enough to avoid steel mill shutdowns caused by scrap shortage. Tin collection figures were improving each month; women were turning in tons of worn silk hosiery to be made into gunpowder bags: waste fats and greases were going into the manufacture of explosives instead of down the drain; some 30,000,000 families had "enlisted" as scrap scouts—for the duration. (*See* also Business Review; Iron and Steel; Newspapers and Magazines; Rubber and Rubber Manufacture; War Production, U.S.) (J. H. Wt.)

Salvation Army. In the United States, the war services of the Salvation Army were continued and intensified in 1942 through five principal channels: (1) Operation of clubhouses and mobile canteens for service men, as designated through the United Service organizations (*q.v.*); (2) Operation of Red Shield clubhouses and mobile and stationary canteens for service men, solely under Salvation Army direction; (3) Volunteer women's activities for service men and civilians; (4) Evacuation and emergency housing of civilians; (5) Collection and salvage of scrap metals, rubber, waste paper, clothing and other discarded materials of value for defense.

As a constituent member of the United Service organizations, the Salvation Army was operating 120 clubs for service men in the United States and off-shore bases, with a field staff of 500, at the close of 1942. The program included community planning, home hospitality, co-operation with army and navy officials, and service club activities. In many local communities, Salvation Army Red Shield clubs and mobile and stationary canteens became a regular part of the program, with all the officer and soldier personnel participating.

In addition, the Salvation Army was administering to U.S. as well as Allied service men in all lands, through more than 1,200 Red Shield clubs and 500 mobile canteens. In the clubs, in the camps, at the hospitals, or actually under fire, the Salvation army performed in the same manner that characterized its outstanding service in World War I.

About 50,000 volunteers from the Salvation Army's Women's Auxiliaries, Women's Advisory councils, Home Leagues and Leagues of Mercy throughout the United States united in a diversified program of national and local war service and civilian aid.

General George L. Carpenter of London, England, international leader of the Salvation Army, made a 30,000-mile tour of the United States, Canada, the West Indies and South America during 1942, inspecting the work of the organization and discussing the army's postwar plans.

Administration of the Salvation Army's war services and regular program is conducted from four territorial centres, where officers' training colleges are situated and the *War Cry*, the official gazette, is issued. The four territorial commanders in 1942 were: (Eastern) Commissioner Ernest I. Pugmire, 120 West 14th st., New York city; (Southern) Commissioner William C. Arnold, 54 Ellis st., Atlanta, Ga.; (Central) Lt.-Commissioner John J. Allan, 713 N. State st., Chicago, Ill.; and (Western) Lt.-Commissioner Donald McMillan, 115 Valencia st., San Francisco, Calif. Commissioner Edward J. Parker, national commander, with headquarters at 120 West 14th st., New York city, coordinated the administration of national policies.

Because of global war conditions, Salvation Army work was seriously handicapped in 20 of the 96 countries and colonies of the world where it had been carried on. Official correspondence ceased, but information from private sources revealed that a limited program was still in operation. The Italian government forbade Salvationists to wear their uniforms and to hold indoor and outdoor meetings.

In the United States, the war made heavy demands upon the personnel and finances of the Salvation Army, principally in the fields of family welfare, juvenile delinquency, the unmarried mother and settlement work. (E. J. Pa.)

Samoa, American. A possession of the United States of America. It lies about 2,700 mi. east of the northern tip of Australia and 2,200 mi. south of the Hawaiian islands; comprises the island of Tutuila and all other islands of the Samoan group E. of longitude 171° W., including Rose island, Tau, Olosega, Ofu, Aunuu and Swains. The principal island is Tutuila, area about 40 sq.mi. Pago Pago, the capital, population 934, has the safest and best harbour in the South Seas. Total population by census of April 1, 1940, 12,908, including 11,919 natives of Samoa (Polynesians); the remainder are foreign born and personnel of the U.S. naval establishment.

Public schools had an average enrolment of 3,000 during 1940–1941. Health and sanitary conditions were excellent. All medical attention is given by naval medical officers who treat the natives free of charge.

The only bank is the Bank of American Samoa, conducting a commercial banking business as a division of the treasury of the naval government of American Samoa, which owns the capital stock. Copra is the chief export; 862 tons, returning $23,557, were exported during the copra crop year ending Jan. 31, 1941; 325 tons of mats, rugs and native curios, returning $69,582, were exported during the fiscal year ending June 30, 1941. Imports: from U.S. $112,998; from New Zealand-Australia $131,984; other $18,721. The island has no indebtedness and receives no financial aid from the U.S. government.

In view of the intimate connection of these island areas with the conflict in the Pacific, it is not practicable to supply up-to-date information because any accurate information would reflect military secrets.

Samoa, Western: *see* MANDATES; PACIFIC ISLANDS, MANDATED.

Sand and Gravel. The United States production of sand in 1941 was 103,835,000 short tons, and of gravel 184,880,000 tons, a total of 288,715,000 tons; these are respectively increases of 32%, 16% and 21% over 1940. In 1941 building construction took 44% of the sand, road paving 38%, and railroads used 4%, partly as ballast, and partly as engine sand. Of the gravel output building took 25%, paving 64%, and railroad ballast 9%. (G. A. Ro.)

Sand Island: *see* MIDWAY ISLANDS.
Sandstone: *see* STONE.

San Francisco. Twelfth largest city of the United States, San Francisco, Calif., by the federal census of 1940, had a population of 634,536. Newcomers crowded into the city during 1941 and 1942 to aid in the war effort, raising the population to about 725,000 as of the Dec. 1, 1942, wartime census taken by the air-raid warden service of San Francisco. Newcomers, streaming into the San Francisco bay area, boosted the metropolitan population about 350,000 above the 1940 United States census of 1,734,308. Mayor (Jan. 1, 1943): Angelo J. Rossi.

War supply contracts to San Francisco bay industries approximating $2,000,000,000, a large percentage of which was shipbuilding, pushed the industrial production volume of this area in 1942 to an all-time new high, bringing employment to about 250,000 wage earners as the year ended, double the total of 1941 and about three times the 1939 total reported by the United States census of manufactures. Industrial payrolls rose 164% during 1942. Financial transactions, retail sales, wholesale trade and carloadings were all about one-fifth greater than the previous year, with the living costs up about 12%.

San Francisco education facilities in 1942 included 184 public schools and many private, parochial, nonsectarian and technical schools; also the University of San Francisco and the San Francisco State Teachers college. Located in San Francisco also are e colleges of medicine, dentistry, pharmacy and law and the hool of fine arts, all branches of the University of California, cated at Berkeley. Also located in San Francisco is the college dentistry and medicine of Stanford university, whose main mpus is located nearby on the San Francisco peninsula.

Situated on the threshold to the far-flung battlefields of the rld, San Francisco was converted into one of the nation's im- rtant production and distribution centres in 1942. Its post ice was second most important in the nation from the stand- int of mail handled for the armed forces, averaging better than 00,000 pieces of first-class mail daily. (R. B. Kr.)

pru, Sir Tej Bahadur (1875–), president of the Indian Liberal federation and vocate of the high court of judicature at Allahabad, was edu- ed at Agra college. He was at one time a member of the All- dia Congress committee and was a delegate at the round table ıferences in London in 1930–31. He also served on the United ovinces Legislative council and on the Imperial Legislative ıncil. In Jan. 1942 he and a number of other Liberal leaders ealed to Prime Minister Churchill to declare that India's con- utional position and powers would be identical with those of ıer units of the British commonwealth. As representing the ıparty group, he had several discussions with Sir Stafford pps, and in July suggested that the British government should equivocally declare that India should have the fullest measure self-government within a year after the war, in order to re- ve the unhappy impression created by the withdrawal of the pps declaration. Later he urged Britain to re-open negotiations h Indian leaders, and in Sept. 1942 he renewed this proposal.

racoglu, Shukru (1890?–) Turkish statesman, was born in Odemis, Turkey. He was edu- ed in Turkish civil service schools and studied law at Lausanne versity, Switzerland. He enlisted in the Turkish army during rld War I, joined with Mustafa Kemal Pasha (Kemal Ata- k) after the armistice and fought against the Greek forces in 1. After the destruction of the Greek armies and the aboli- ı of the sultanate, Saracoglu became a member of the national embly as deputy from Izmir, and rose swiftly in the ranks of stafa Kemal's party. An advocate of westernization for Tur- , he instituted many legal reforms during his tenure as justice ıister, 1932–38. After Ataturk's death in Nov. 1938, Saracoglu named foreign minister and clung to a consistent course of trality, although he was frequently pressed by both the allied ions and the axis for an alliance during the first three years of rld War II. After the death of Refik Saydam in July 1942, acoglu became prime minister of Turkey.

rawak: *see* British Empire.

rg, Tony (Anthony Frederick) (1882–1942), U.S. artist and creator marionettes, was born April 24 in Guatemala, the son of Ger- ı and English parents. He was educated in German military ools and became an officer at the age of 21. He gave up his ımission two years later to study art in London. He later went the United States, became a naturalized citizen in 1921 and ieved fame as a creator of marionettes. He designed marionette ws, illustrated books and experimented with animated cartoons. ong the many books he wrote and illustrated are: *Book for ldren* (1924); *Animal Book* (1925); *Trick Book* (1928); *Book of Marionette Plays* (1927); *Wonder Zoo* (1939); and *Wonder Book* (1941). He died in New York city, March 7.

Saskatchewan. The central of the three prairie provinces of Canada, Saskatchewan was created a province by the dominion parliament in 1905. Area, 251,700 sq.mi., comprising open plains country in the south, and broken wooded land in the north. Pop. (1941 census) 895,992. Saskatchewan sent 21 members to the house of commons, and 6 senators to the senate, as of 1941. Local administration is in the hands of a provincial parliament. In the general elections of 1938, William Patterson, the Liberal prime minister, was continued in office. There were no changes of political importance during 1942. The chief cities of Saskatchewan (population based on the 1941 census) are as follows, Regina, capital (56,520), Saskatoon (42,269), Moose Jaw (20,496), Prince Albert (12,290), and Weyburn (6,119).

Communication.—In 1941 there were 4,450 mi. of surfaced roads, and 147,505 mi. of improved earth roads. In 1940 there were 126,970 automobiles registered within the province.

Agriculture.—The total value of crops in 1941 was $117,117,000; in 1940 it was $176,078,000. The following figures show the value of individual crops for 1941; wheat $68,000,000; oats $24,810,000; barley $10,640,000; flax seed $4,500,000; potatoes $2,197,000.

Finance.—Ordinary revenue in 1940 was $24,958,420; ordinary expenditure $25,258,324; bonded indebtedness $123,677,353. A notable feature of the year was the importation into the province of more than 1,000 volunteer college students to aid in harvesting the bountiful, but exceptionally late, wheat crop.

Sauer, Emil von (1862–1942), German pianist, was born Oct. 8 in Hamburg. A pupil of Nicholas Rubinstein in Moscow and Franz Liszt in Weimar, he made his debut in Berlin before the German imperial family in 1895. After a triumphal tour through England, Russia and the United States, he settled in Vienna. He taught at the Vienna conservatory, 1901–07, and was director of the piano master-classes from 1915 until his death. He was knighted by the Austro-Hungarian monarchy in 1917. He composed two piano concertos, two piano sonatas, 32 concert études, edited the complete works of many composers and was the author of an autobiography *Meine Welt* (1901). He had been appointed chamber virtuoso by the royal courts of Saxony, Rumania and Bulgaria. He died in Vienna, according to a Berne dispatch of April 29.

Saydam, Refik (1881–1942), Turkish premier, had been medical attendant to Kemal Ataturk, first president of Turkey. He held the post of minister of health and in that capacity was invited by the Rockefeller foundation in 1929 to study health and social service institutions in the United States. Under his guidance, Turkey established public health and welfare services. He resigned from the health ministry to become minister of the interior, 1938–39. In 1939, Dr. Saydam was named premier. After the outbreak of World War II, he advocated a policy of neutrality but warned aggressor nations that the Turkish army was capable of warding off an invasion. His government signed the Anglo-French treaty of mutual assistance in Oct. 1939. Shukru Saracoglu replaced him as acting premier in Nov. 1941. Dr. Saydam died in Istanbul, July 7.

Schizophrenia: *see* Psychiatry.

Schneider, Eugene (1868–1942), French munitions maker, financier and politician, was born Oct. 29 in Le Creusot. He inherited the Creusot foundries, bought by his grandfather in 1836, and built up these works until the Schneider-Creusot armaments plants ranked with Krupp and Vickers-Armstrong in munitions and armaments production. Schneider was in the French chamber of deputies from 1900 to 1925. After the war, Schneider established a holding company, 1920, through which he controlled 182 French and 230 foreign armament works. Before the outbreak of World War II, he held 56% of the stock of the Czechoslovak Skoda works and allied firms, and was the power behind the Comité des Forges, the French steel trust. The principal Schneider plant at Le Creusot was bombed by the royal air force in 1942. The death of Schneider was reported in a Paris dispatch received in Berne on Nov. 17.

Schofield, Frank Herman (1869–1942), U.S. naval officer, was born Jan. 4 at Jerusalem, N.Y. A graduate of the U.S. Naval academy, 1890, he served in the Spanish-American War with a squadron in the Cuban blockade. During World War I, he was on the staff of the office of the chief of naval operations and was later attached to the U.S. naval forces in European waters, serving in London on Admiral Sims's staff. He assisted in drawing up the naval peace terms with Germany, and was naval representative at the three-power conference in Geneva in 1927. He was made commander of the battleship division in 1929, later serving as commander in chief of the U.S. fleet until his retirement in 1933. He was named rear admiral in 1924 and had been awarded the Navy cross. He died at the National Naval Medical centre, Bethesda, Md., Feb. 20.

Schurman, Jacob Gould (1854–1942), U.S. educator and diplomat, was born May 22 in Freetown, Prince Edward Island. For a biographical note see *Encyclopædia Britannica*. He was ambassador to Berlin from 1925 to 1930, and honorary lecturer on international relations at the Institute of Technology in Pasadena, Calif., from 1931 to 1932. He died in New York city, Aug. 12.

Scientific Research and Development, Office of. The Office of Scientific Research and Development (OSRD) was created in the Office for Emergency Management (*q.v.*) by executive order 8807 of June 28, 1941. Dr. Vannevar Bush of the Carnegie institution of Washington was appointed director. The functions of the office were outlined as follows:

(a) Advise the president with regard to the status of scientific and medical research relating to national defense and the measures necessary to assure continued and increasing progress in this field.

(b) Serve as the centre for the mobilization of U.S. scientific personnel and resources in order to assure maximum utilization of such personnel and resources in developing and applying the results of scientific research to defense purposes.

(c) Co-ordinate, aid and, where desirable, supplement the experimental and other scientific and medical research activities relating to national defense carried on by the departments of war and navy and other departments and agencies of the federal government.

(d) Develop broad and co-ordinated plans for the conduct of scientific research in the defense program, in collaboration with representatives of the war and navy departments; review existing scientific research programs formulated by the departments of war and navy and other agencies of the government, and advise them with respect to the relationship of their proposed activities to the total research program.

(e) Initiate and support scientific research on the mechanisms and devices of warfare with the objective of creating, developing and improving instrumentalities, methods and materials required for national defense.

(f) Initiate and support scientific research on medical problems affecting national defense.

(g) Initiate and support such scientific and medical research as may be requested by the government of any country whose defense the president deems vital to the defense of the United States under the terms of the act of March 11, 1941, entitled "An Act to Promote the Defense of the United States"; and serve as the central liaison office for the conduct o such scientific and medical research for such countries.

(h) Perform such other duties relating to scientific and medical research and development as the president may from time to time assign or delegat to it.

Within the OSRD were set up the National Defense Research committee (NDRC) and the Committee on Medical Research (CMR), the former to assist the director of the OSRD in the mobilization of the scientific personnel and resources of the U.S. and the latter to advise and assist with special reference to the medical personnel and resources of the U.S. The NDRC operated as a committee of the Council of National Defense from June 27, 1940 until June 28, 1941, during which time it entered into a number of contracts which were assumed by the OSRD.

The OSRD in 1942 operated through contracts with scientific laboratories in academic and industrial establishments. As o Nov. 30, 1942, the OSRD had concluded 1,725 contracts, while work was actively under way under approximately 425 additional letters of intention for which covering contracts were in the process of negotiation. These contracts and authorizations were with a total of 107 academic and 173 industrial establishments. Most of the work of the OSRD was started at the direct request of the armed services. Practically all of it was of a confidential nature which made it impossible to reveal details. However, results o the OSRD efforts had already been shown at the end of 1942 in very substantial orders placed by the armed services for equipment. Between June 27, 1940 and Nov. 30, 1942 the OSRD and its predecessor NDRC had received a total of $141,655,618 to be used in carrying out its objectives. (I. St.)

Sculpture. Special exhibitions and competitions were held in 1942, revealing fresh accomplishments; museum made valuable additions to their collections, a few public work already projected were completed. While there was an inevitable decline in government-sponsored sculpture projects, patronage was assumed by civic and local groups in important instances and gave renewed assurance of support.

Artists for Victory Inc., an emergency wartime organization o 17 leading local and national art associations, represented by members of all the leading branches of art, showed the way fo specific progress. It proved advantageous to sculpture by drawing the profession together under a common leadership and by providing opportunities for new work and for exhibiting before the public. Under the auspices of the group large sums of money were distributed as exhibition prizes and through other compet

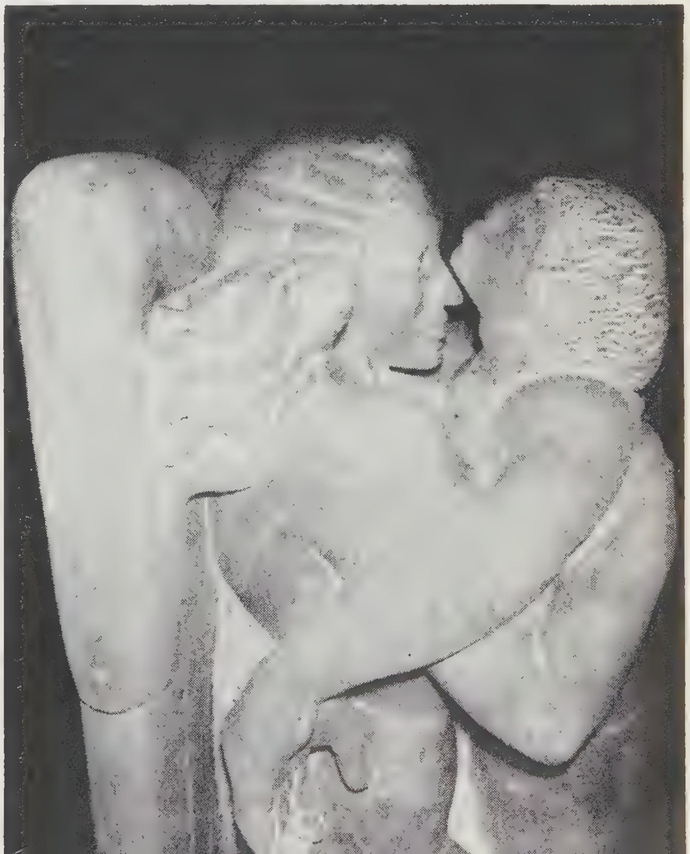
JACOB EPSTEIN finished his "Jacob and the Angel," a detail of which is shown here, in London early in 1942. He carved the work—a representation of the Old Testament story—from a six-ton block of alabaster



tion to sculptors throughout the United States.

The most conspicuous achievements of Artists for Victory were the awarding of $25,000 to 14 of the sculptors participating in the special exhibition of contemporary American art at the Metropolitan museum, and the promoting of a competition at the Whitney Museum of American Art for a temporary monument to "The Spirit of Aviation," in which six prizes amounting to $1,500 were awarded to successful contestants. Both events brought eager responses from hundreds of sculptors, and many works by outstanding artists were exhibited in both instances.

Apart from such special incentives which tended to offset the decline in federal patronage, sculpture received the support of long-established groups. The National Academy of Design, the Art Institute of Chicago and the Whitney museum continued their annual shows, each giving sculpture a prominent representation. The progressive Sculptors' Guild arranged a stimulating show more broadly defined than any of the others, in which United Nations artists of both Europe and Latin America took part, as well as many of the younger sculptors of the eastern area of the United States. While the authoritative National Sculpture society refrained from making any major demonstration under wartime conditions, it furthered its educational program with the preparation of a circulating exhibition of large-scale photographs of the recent work of the members, designed for presentation in museums, colleges and universities throughout the country. In this field of education, the Museum of Modern Art of New York also was active in circulating work in the more advanced categories.

While the curtailment of international trade doubtless limited importations of historical sculpture, and few important acquisitions were recorded, notable gifts were made to leading institutions. The gift of the famous Widener collection to the National Gallery of Art by Joseph E Widener of Philadelphia added another magnificent group of Renaissance sculpture to the public treasure store, including masterpieces of Italian artists such as Desiderio da Settignano, Donatello (represented by the celebrated "David" of the Casa Martelli), Rossellino, Luca della Robbia, Benvenuto Cellini, Jacopo Sansovino and Giovanni da Bologna. In the year's most munificent gift to an American museum French 18th century sculpture in the Renaissance tradition also included the work of Coysevox, Lemoyne and Houdon, the latter represented by several distinguished portraits.

Counting the acquisitions made by the Metropolitan museum through Artists for Victory, the latter made the most contemporary sculpture additions to the art of the museums Besides the "Maternity" group of Jose de Creeft, winner of the first purchase-prize, a monumental wood carving of St. Francis by the noted Brazilian sculptress, Maria Martins, also was acquired during the year

While relatively few imposing memorials were recorded as completed and unveiled to the public, progress on public works was noted in the final realization of two massive stone groups, each consisting of a titanic horse and a man, on either side of the terrace of the Federal Trade Commission building, in Washington. The groups were designed by Michael Lantz, who was awarded the commission four years ago as the outcome of a nation-wide federal competition which was held under the program then being carried out by the Section of Fine Arts. To commemorate the destruction of Lidice, however, Jo Davidson completed a memorial group which was sponsored by the Writers' War board on behalf of the Lidice Lives committee, and a statue of George Washington by George M. Proctor, also was erected at the Valley Forge National Shrine.

In Europe sculpture retained the status quo, its activity and production varying little from the position in which it found itself during the first two years of the war. Apart from the dedication of a sculpture of Lenin in Holford square, London, and the completion by Jacob Epstein of a monumental carving of "Jacob and the Angel" in his studio there, few developments in sculpture were reported from Europe. Secondary Metals. So far as data were available at the close of 1942, the following table presents the recovery of secondary metals in the United States in recent years; this material may either be scrap made in the producers' plants in the working of new metal, and thus has never been in use, or may be old and worn-out products discarded from the pool of metal in use and collected as "junk."

Secondary Nonferrous Metals Recovered in the United States

	1937	1938	1939	1940	1941
Copper—Thousands of short tons					
As metal	285.6	192.4	151.4	170.8	135.9
In alloys	246.5	167.4	345.1	351.8	580.7
In chemical compounds	?	?	3.2	9.4	9.8

Silver—Thousands of troy ounces	?	18,438.8	24,972.3	?	?

*Ratio of secondary recovery to consumption of new metal; where a second figure appears, this is the percentage of the total secondary metal recovered from *old* materials, the remainder having come from the reworking of new plant scrap.

†Includes some in chemical compounds. ‡Other platinum group metals.

In addition to the nonferrous metals listed above, there was consumed in the United States in 1941 in the production of steel a total of 59,216,000 short tons of ferrous scrap, an increase of 31% over 1940. This total included 33,905 tons of scrap made in the producers' own plants (mainly new scrap), and 25,311,000 tons of purchased scrap (mainly old scrap). (G. A. RO.)

Second World War: *see* WORLD WAR II

Secret Service, U. S. Established during the Civil War, this division of the treasury department is one of the oldest federal law enforcement agencies. Its major duties include the protection of the person of the president of the United States, the members of his immediate family and the president-elect; the policing of the White House and its grounds; the suppression of the counterfeiting and altera-

UNTERFEITERS' EQUIPMENT seized by U.S. Secret Service agents in New k city in Jan. 1942

n of all government obligations; the protection of treasury ldings, money and securities and the enforcement of other s relating to the treasury department.

The outstanding accomplishment of the secret service during year ended June 30, 1942, was the smashing of a conspiracy flood the country with counterfeit 25-cent war savings stamps. New York city on May 12, 1942, secret service agents and post ce inspectors arrested 6 men comprising the engravers, printers, ancial backers and distributors and captured 200,692 bogus mps with a representative value of $50,173, together with a -design plate from which the counterfeits were printed. This ortive counterfeiting venture was suppressed before anyone was frauded, since the stamps had not been placed in circulation. ve of the defendants were sentenced in New York on June 11 serve 10 years each, and the sixth was sentenced to serve 8 ars.

Losses suffered by victims of counterfeit notes totalled $47,882 the fiscal year ended June 30, 1942, a drop of 93% from the arly average during the period 1933 to 1936, which preceded the ret service program of Crime Prevention through Education.

The secret service early in 1942, in co-operation with the board governors of the federal reserve system, distributed to all nks a card index describing all counterfeit bills which have apared in circulation since the size of the currency was changed 1929. An order issued January 29, 1942, authorized all banks d banking institutions of any nature whatsoever, organized der general or special federal or state statutes, to take possession of and deliver to the secret service all counterfeit money presented at their places of business.

During the fiscal year 1942, 22 new counterfeit note issues were detected. Secret service agents captured 34 metal plates for the printing of counterfeit obligations, as well as 12 steel dies, 252½ plaster moulds and 26½ metal moulds for the manufacture of counterfeit coins.

Agents seized bogus and altered notes with a total representative value of $72,950. Of this amount, $10,440 was seized before it reached circulation and of the balance, only $47,882 represented losses suffered by victims of passers of counterfeit notes.

Counterfeit coin seizures totalled $39,806.56, of which $5,288.84 was captured before it reached circulation. Of the balance, only $28,767 represented losses suffered by victims of passers of counterfeit coins.

During the fiscal year 26,821 cases were disposed of. In the 1,898 cases brought to trial, convictions were obtained in 97.6% of the cases, as compared with 97.1% of convictions during the previous year. Fines in criminal cases totalled $32,988.10 and imprisonments totalled 1,692 years 3 months 3 days and 5 hours. Additional sentences totalling 2,260 years and 7 days were suspended or probated.

The secret service investigated 11,985 cases relating to forged government checks. (F. J. W.)

Securities: *see* Business Review; Stocks and Bonds.

Securities and Exchange Commission.

Substantial progress was made by the Securities and Exchange commission during its fiscal year ending June 30, 1942, towards reaching the objectives sought by the geographic integration and corporate simplification provisions of the Public Utility Holding Company act of 1935. There were 26 new proceedings begun during the year to require registered holding companies to comply with the integration and simplification provisions of the statute.

During the year ended June 30, 1942, 124 applications or declarations relating to security issuances filed by registered public utility holding companies and their subsidiaries were approved by the commission. These effective filings totalled $631,661,484 in principal amount compared with $1,065,893,281 for the preceding fiscal year. The total of new securities issued during the period from December 1, 1935, the effective date of the act, to June 30, 1942, amounted to $4,583,487,267. There were 134 public utility holding companies registered with the commission at June 30, 1942. The total consolidated assets of these companies amounted to approximately $16,000,000,000, or about 68% of the private electric and gas utility industry of the United States. These 134 registered holding companies constituted 53 public utility holding company systems, which included 1,342 holding, subholding and operating companies. The holding company systems involved in integration or simplification proceedings under the act at June 30, had consolidated assets aggregating $14,237,000,000.

Securities effectively registered under the Securities act of 1933 during the fiscal year ended June 30, 1942, aggregated $2,052,000,000, compared with $2,611,000,000 for the preceding fiscal year, and with $1,787,000,000 for the fiscal year ended June 30, 1940. Securities proposed for sale by issuers totalled $1,461,000,000 compared with $2,081,000,000 in the preceding fiscal year and with $1,433,000,000 in the 1940 period.

The main offices of the Securities and Exchange commission were moved in 1942 to Philadelphia, Pa. There were also offices in Washington, D.C., and ten regional offices at Atlanta, Ga.; Baltimore, Md.; Boston, Mass.; Chicago, Ill.; Cleveland, O.; Fort

Worth, Tex.; New York, N.Y.; San Francisco, Calif., Seattle, Wash.; and Denver, Colo.

During the fiscal year ended June 30, 1942 the commission received nearly 12,000 items of mail classified as "complaint-enforcement." Up to July 1, 1942 the commission had referred to the department of justice 378 criminal cases, including 49 which were referred during the 1942 fiscal year. Since the organization of the commission in 1934, a total of 2,035 defendants had been indicted in 306 cases, including 27 cases which had been referred to the post office department. During the 1942 fiscal year, indictments were returned against 183 defendants. Convictions had been obtained against 885 defendants in 216 cases, representing 91.3% of the 259 cases which had been disposed of as to principal defendants. There were 142 defendants named in 44 cases who were convicted during the 1942 fiscal year.

There were ten civil proceedings pending at the beginning of the commission's 1942 fiscal year. During the year the commission instituted 36 additional proceedings including 33 injunctive actions brought against 91 persons to restrain them from fraudulent and otherwise illegal practices in the sale of securities. Of this total of 46 proceedings, 35 were disposed of during the year, including 28 cases which resulted in the entry of injunctions against 61 persons.

Investment advisers registered with the commission under the Investment Advisers act on June 30, 1942 totalled 732 as compared with 753 at the end of the previous fiscal year. At the same date there were 5,557 broker-dealers registered with the commission under the Securities Exchange act.

The chairman of the commission in 1942 was Ganson Purcell of New York. Other members of the commission were: Robert E. Healy of Vermont; Sumner T. Pike of Maine, Edmund Burke, Jr. of New York and Robert H. O'Brien of Montana. (*See* also STOCKS AND BONDS.) (G. PL.)

Seeing Eye.

This organization, which teaches dogs to guide blind persons, began to operate in 1928 when Morris Frank brought his German shepherd, Buddy I—bred and trained by Mrs. Harrison Eustis and Elliott S. Humphrey in Switzerland—to New York and proved that American street traffic could not baffle the expert animal. In 1942, 716 blind men and women, from every State in the Union, were using dogs educated by the Seeing Eye at Morristown, N.J. and were thus made happy and capable of earning their living as lawyers, ministers, journalists, musicians, beekeepers, electrical and radio engineers, teachers, pharmacists, salesmen, undertakers and as factory workers in war industries. Some of these self-reliant blind persons were using their second dogs; a few their third. A dog's life is not long, and the Seeing Eye guarantees not to let slip back into dogless darkness anyone whom a guide dog has once set free.

Immediately after Pearl Harbor it was resolved that, "The Seeing Eye will, at no expense to the federal government, endeavour to provide Seeing Eye dog guides for eligible persons who, as members of the armed forces of the United States, have lost their sight in line of duty." Moreover, Elliott S. Humphrey was "lent" to the Army to help set up a system for training war dogs.

Seignobos, Charles

(1854–1942). French historian, was born Sept. 10 at Lamastre. He was professor of history at the Sorbonne, 1890–1927, and honorary professor until his death. Prof. Seignobos was regarded as one of France's great historians His last work, *Histoire comparée des peuples de l'Europe,* was published in 1938. He died at his home in Brittany, according to a Vichy dispatch of April 29. (See *Encyclopædia Britannica.*)

Seismology.

Progress in seismology during 1942 was affected by the war. An unknown number of observing stations must have been destroyed or suspended, and much of the major earthquake belts was in active war zones without communications. However, the principal earthquakes were located and their intensity appraised from instrumental records of distant stations. While there was no major earthquake there were about 13 in which loss of life or property or both occurred, the most severe being that of May 13 in Ecuador.

Two new seismograph stations were established in the United States, and four of its stations and one in Colombia were provided with new instruments. Two stations were maintained in Greenland. Canada, the United States, Mexico, El Salvador, Guatemala, Australia and New Zealand co-operated in earthquake location. Records of earth motion associated with destruction were obtained, the most important being those of the earthquake of Oct. 21 in southern California. Vibration periods of buildings and other structures were obtained to aid in earthquake-resistant design. This involved a range of vibration periods not otherwise observed and such measurements formed an important war contribution.

Geodetic surveys of the year provided many new points from which to determine crustal movements possibly associated with earthquake. Tilt measurements continued with inconclusive results. Tide gauges established through co-operation of American republics in South and Central America with the United States aided in detecting crustal movements and the study of seismic seawaves. Special investigations requiring additional observations were stopped because of war demands on personnel, but some studies of accumulated data were made. The activities of international seismological organizations were curtailed and in some cases discontinued. (*See* also DISASTERS.) (N. H. H.)

Selective Service.

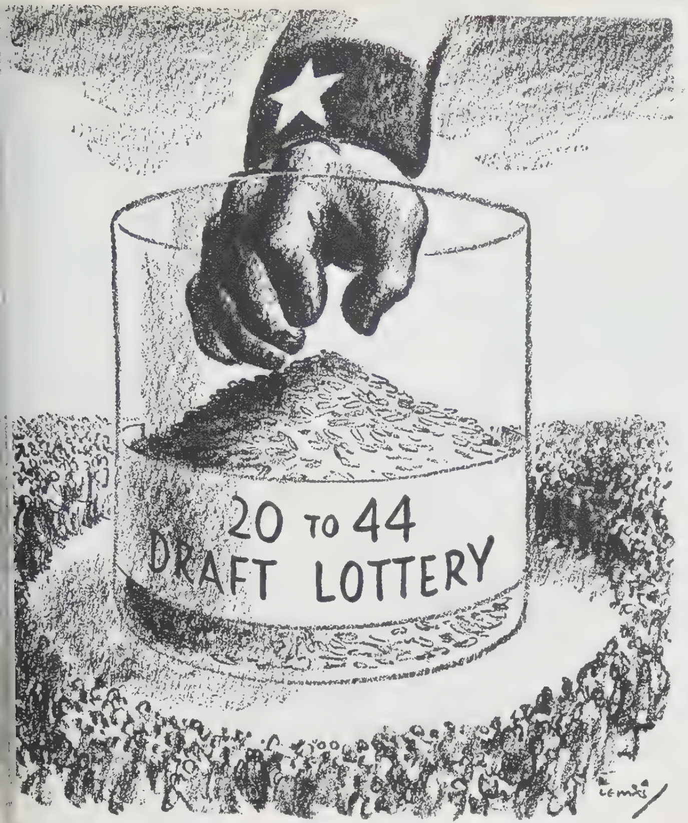
Fifteen months of actual operations brought Selective Service to the beginning of 1942 with a trained and experienced organization that extended into every community in the U.S. and numbered more than 200,000 citizens, the large majority of whom were patriotic volunteer workers.

As the need for men and the size of the army increased, the physical standards were lowered, because there were increased opportunities for service by men who were not fit for full combat duty. As the need for men increased, Selective Service became increasingly severe in the classification of men for occupational reasons and judged requests for deferment on a basis of comparative contribution to the total war effort.

As the need for men increased, Selective Service became increasingly severe in the classification of men for dependency reasons, and more and more curious and concerned about the kind and amount of dependency involved in each individual case.

In all of this process of selecting the men who would serve in the armed forces, and selecting the men who would stay at home to continue in their civilian occupations to serve the national war effort or care for their dependents, the local board comprised of patriotic volunteer workers from the individual community had the first jurisdiction and made the decision regarding its neighbours who were registered in the local board.

On Jan. 31, 1942 there were 6,269 of these local boards throughout the U.S., at least one in each county. Alaska had 24 boards; Puerto Rico, 122 boards; Hawaii, 25 boards. The entire Selective Service system numbered more than 200,000 persons, the very large majority of whom were patriotic volunteer workers who served as local board, appeal board and advisory board members, government appeal agents, medical and dental examiners and re-employment committeemen. The Selective Service system was



E THIRD U.S. SELECTIVE SERVICE LOTTERY, March 17, 1942, to deter-
e the order numbers of men between 20 and 44, was the subject of this
oon by Lewis in the *Milwaukee Journal*. The drawing carried the caption,
ch Man, Poor Man, Beggar Man....." etc.

anized and its personnel trained over 15 months of actual
rations to do anything the armed forces required in personnel
curement.

arly in 1942, Secretary of War Stimson announced that the
l for the armed forces by the end of 1942 was 3,600,000 men
he army, 400,000 in the navy and 200,000 in the marine corps.
is would have indicated a total induction into the army for
2 by Selective Service of 1,900,000 men, an average of 158,000
month. Actual inductions during the year many times ex-
ded that figure. In addition, volunteer recruiting by the army,
y and marine corps many times exceeded announced schedules.
military reasons, the actual figures on inductions and the real
of U.S. armed forces were not made public.

t was a special objective of Selective Service to preserve the
ily life of the U.S. intact, to the greatest extent possible. It
particularly concerned with families with children, but it was
to be socially desirable that the family as the foundation
ial institution should be maintained during the emergency.
s was so, even though the fundamental problem which Se-
ive Service dealt with was not marriage, but dependency.
ile practically all the "dependencies" recognized by the regula-
s grow out of marriage, the fact of dependency and not of
riage was to be administratively determined. The dependents
st, in fact, depend on the registrant's income for their support,
while the financial problem was the main one, the spiritual
tionship and dependence was not to be entirely disregarded.
s was the substance of advice sent by national headquarters
published widely in the newspapers. In the light of the facts,
the statistics of increased marriages, the Selective Service
l boards were on the alert for evidence where marriage might
used as a means to create dependency in order to evade mili-
training and service. Generally speaking, the deferments on
unds of dependency were generous and were warranted by the peacetime situation in which the decisions were made.

In the first two registrations, with their 17,000,000 registrants, more than 10,000,000 registrants were placed in Class III. This was one indication of the social importance of this class. It aimed at maintaining, in its unity, the family. But, from the social viewpoint, the indirect social results not related to family life were not less important in this period of world-wide war. The protection of the great body of skilled workers on the farms and in the factories was made possible by this more deferred classification in Class III formally on dependency grounds. Here was the industrial and agricultural manpower pool. The maintenance of the ordinary processes of war production and of the morale of the civilian life was also achieved indirectly by this classification.

Section 5 (e) of the law reads as follows:

". . . The President is also authorized, under such rules and regulations as he may prescribe, to provide for the deferment from training and service under this act in the land or naval forces of the United States (1) of those men in a status with respect to persons dependent upon them for support which renders their deferment advisable, . . ."

The law specifically limited dependency deferments by the following words:

"Section 15. When used in this act . . . (c) the term 'dependency' when used with respect to a person registered under the provisions of this act, includes only an individual (1) who is dependent, in fact, on such persons for support in a reasonable manner, and (2) whose support in such manner depends on income earned by such person in a business, occupation, or employment."

The regulations provided that registrants upon whom one or more dependents depended for support in a reasonable manner should be placed in Class III. The regulations restricted the persons who could be dependent upon a registrant as follows: The registrant's wife; divorced wife; child, including adopted child, or a child born out of wedlock; parent, including persons who were supported in good faith by the registrant and whose relationship was similar to that of the parent; grandparents; brother or sister (brother or sister included only a person having one or both parents in common with the registrant, who was either under 18 years of age, or was physically or mentally handicapped); and other persons under 18 years of age, or a person of any age who was physically or mentally handicapped whose support the registrant assumed in good faith.

On June 23, 1942 the whole concept and determination of dependency deferments was changed when the Serviceman's Dependents Allowance Act of 1942 was approved. It was entitled, "An Act—To provide family allowances for the dependents of enlisted men of the Army, Navy, Marine Corps and Coast Guard of the United States . . ." It provided that:

"SEC. 101. The dependent or dependents of any enlisted man of the fourth, fifth, sixth, or seventh grades in the Army of the United States, the United States Navy, the Marine Corps, or the Coast Guard, including any and all retired and reserve components of such services, shall be entitled to receive a monthly family allowance for any period during which such enlisted man is in the active military or naval service of the United States on or after June 1, 1942, during the existence of any war declared by Congress and the six months immediately following the termination of any such war.

"SEC. 102. The monthly family allowance payable under this title to the dependent or dependents of any such enlisted man shall consist of the Government's contribution to such allowance and the reduction in or charge to the pay of such enlisted man.

"SEC. 103. The dependents of any such enlisted man to whom

BEFORE CONGRESS lowered the Selective Service minimum age to 18 years in 1942, thousands of 18- and 19-year-olds volunteered for service. The picture shows some of these youths being sworn into the army at New York city in Oct. 1942

a family allowance is payable under the provisions of this title shall be divided into two classes to be known as "Class A" and as "Class B" dependents. The Class A dependents of any such enlisted man shall include any person who is the wife, the child, or the former wife divorced of any such enlisted man. The Class B dependents of any such enlisted man shall include any person who is the parent, grandchild, brother, or sister of such enlisted man and who is found by the Secretary of the department concerned to be dependent upon such enlisted man for a substantial portion of his support.

"Sec. 104. A monthly family allowance shall be granted and paid by the United States to the Class A dependent or dependents of any such enlisted man upon written application to the department concerned made by such enlisted man or made by or on behalf of such dependent or dependents. A monthly family allowance shall be granted and paid by the United States to the Class B dependent or dependents of any such enlisted man upon written application to the department concerned made by such enlisted man, or upon written application to the department concerned made by or on behalf of such dependent or dependents in any case in which the Secretary of the department concerned finds that it is impracticable for such enlisted man to request the payment of such allowance. The payment of a monthly family allowance to any Class B dependent or dependents of any such enlisted man shall be terminated upon the receipt by the department concerned of a written request by such enlisted man that such allowance be terminated.

"Sec. 105. (a) The amount of the Government's contribution to the family allowance payable to the dependent or dependents of any such enlisted man shall be the aggregate of the amount of the Government's contribution to the Class A dependent or dependents of such enlisted man and the amount of the Government's contribution to the Class B dependent or dependents of such enlisted man.

"(b) The amount of the Government's contribution to the Class A dependent or dependents of such enlisted man shall be at a monthly rate of—

(1) $28, if such enlisted man has a wife but no child;
(2) $40, if such enlisted man has a wife and one child, and an additional $10 for each additional child;
(3) $20, if such enlisted man has no wife but has one child;
(4) $30, if such enlisted man has no wife, but has two children, and an additional $10 for each additional child; and
(5) $20, in addition to the amounts, if any, payable under clauses (1), (2), (3), or (4) of this subsection, if such enlisted man has a former wife divorced.

"(c) The amount of the Government's contribution to the Class B dependent or dependents of any such enlisted man shall be a a monthly rate of—

(1) $15, if such enlisted man has only one parent who is a Class B dependent, and an additional $5 for each grandchild, brother, or siste which such enlisted man has who is a Class B dependent, but not mor than $50 in the aggregate;
(2) $25, if such enlisted man has two parents who are Class B dependents, and an additional $5 for each grandchild, brother, or siste which such enlisted man has who is a Class B dependent, but not mor than $50 in the aggregate; and
(3) $5, if such enlisted man has no parent who is a Class B dependent, for each grandchild, brother, or sister which such enlisted man ha who is a Class B dependent, but not more than $50 in the aggregate

"In any case in which the amount of the Government's contribution to the Class B dependents of any enlisted man would be greater than $50, if there is no limitation upon the aggregate amount of the Government's contribution to such dependents the amount contributed by the Government to each such dependent shall be reduced in the same proportion as the aggregate amount of the Government's contribution to all such dependents is reduced.

"Sec. 106. (a) For any month for which a monthly family allowance is paid under this title to the dependent or dependents of any such enlisted man the monthly pay of such enlisted man shall be reduced by, or charged with, the amount of $22, and shall be reduced by, or charged with, an additional amount of $5 if the dependents to whom such allowance is payable include both Class A and Class B dependents. The amount by which the pay of any such enlisted man is so reduced or with which it is s charged shall constitute part of the monthly family allowance payable to his dependent or dependents.

“(b) In any case in which the mily allowance is payable to ore than one dependent of any ch enlisted man, the amount which the pay of such en- ted man is reduced or with hich it is charged shall be ap- rtioned among and paid for e benefit of such dependents the following proportions:

“(1) If such dependents are all Class A dependents or are all Class B dependents, such amount shall be apportioned among such dependents in the same ratio in which they share the total Government contribution payable to them under section 105.

“(2) If one or more of such dependents are Class A dependents and one or more of such dependents are Class B dependents, $22 of such amount shall be apportioned among such Class A dependents in the same ratio in which they share the total Government contribution payable to such Class A dependents under section 105 and $5 of such amount shall be apportioned among such Class B dependents in the same ratio in which they share the total Government contribution payable to such Class B dependents under section 105.

‘(c) Notwithstanding any other provision of this title, in any e in which a family allowance is granted under this title to a e or a child living separate and apart from the enlisted man der a court order or a written agreement, or to a former wife orced, the amount of the family allowance payable to such e, child, or former wife divorced shall not exceed the amount d in the court order or decree or in the written agreement as amount to be paid to such wife, child, or former wife divorced. any case in which the application of the provisions of the ceding sentence results in a reduction in a family allowance ich would otherwise be payable under this title, the amount by ich the pay of the enlisted man is reduced or with which it is rged and the amount of the Government contribution to such ily allowance may each be reduced in accordance with such ulations as may be prescribed by the Secretary of the depart- nt concerned.”

The immediate result of the passage of this act was that usands of men with dependents volunteered for induction ough their local boards. The amount of the allowance in many es exceeded the financial contribution the registrant had been king to his family.

Re-employment.—The demobilization of armies has always ated a serious problem which lasted until the ex-soldiers were orbed into civilian life. The infant government of the United tes granted large tracts of land to the soldiers who fought in Revolutionary War, as a soldier's bonus. This served as a tial solution of the re-employment program. Free land for soldiers was available for the veterans of the wars up to and luding the armies of 1861–65.

The demobilization of nearly 5,000,000 men after World War I sented a re-employment problem of great magnitude. The free d, for all practical purposes, had been exhausted. That a total 213,000 individual World War I veterans had been enrolled the CCC camps about 23 years after the war was proof of the d of a comprehensive re-employment program. The figure would surely have been larger except that the veteran enrolments were limited by law to not more than 10% of the total number of enrollees.

All efforts in job restoration and job procurement were purely on a voluntary basis by veterans' organizations and patriotic groups within the several communities. One example was that of the 77th division of the army. When this division returned from overseas, the officers and men had contributed money to cover the necessary expenses of supervision which achieved close to 100% placement of the former members of this division in civilian occupations.

No provisions were made for handling re-employment in the studies prepared by the joint army and navy Selective Service committee, although the importance of the problem was fully realized. It was assumed that this work would, in all probability, be entrusted to some other agency. Immediately after the passage of the Selective Service act a “personnel division,” as required by the law, was established. It was designated as the re-employment division.

The objectives of the re-employment division were determined to be as follows:

1. To assist, at the local board level, trainees in being restored to their former positions.
2. To give active assistance, at the local board level, to all trainees who were unemployed at the time they entered the army.
3. To assist trainees to find better jobs than those they formerly held.
4. To encourage trainees to take pre-employment or supplemental training courses so as to fit themselves for positions in the defense industries.

The early objectives of the re-employment division were much broader than those required by the law; but under the training program it was contemplated that there would be a fairly steady flow of men into the army, and out of the army back to civil life, in the peacetime conditions prevailing, and the numbers involved would not place a burden upon the organization. It was also realized that the national policy concerning the defense industries would require many additional workers in the defense industries and the upgrading of many employees.

The re-employment program called for the appointment of a re-employment committee or committeeman for each local board,

nominated by the local board, and approved by the state Selective Service administration. In the more populous centres a clearing-house committee, consisting of civic leaders and representatives of industry and labour, was to be established. The occupational and educational history of each man was to be secured and forwarded to the local re-employment committeeman at least one month before the man returned to civil life. The first effort was made to find out if the demobilized soldier or sailor could be returned to the position he left. If it seemed possible to re-employ the soldier or sailor and the employer was recalcitrant, the re-employment committeeman was to personally see if he could adjust the matter; if not, it was to be turned over to the clearing-house committee for solution by moral suasion prior to being sent to the United States district attorney having jurisdiction, for prosecution of the employer for violating the law.

For the man who was unemployed, efforts of the United States employment service and the re-employment committeeman were to be co-ordinated so as to give him genuine assistance.

Extensive and detailed investigations were made to organize the occupational information about the men in the armed forces, and a final form had not been determined during the period covered by this report. The experiments continued in 1942. Post-war re-employment plans were under constant study.

During 1942, 80,000 men wounded and unfit for further military service were returned to civilian life. If physically able to take hi place in civilian life again, the returning soldier was placed in job immediately. If physically handicapped, an effort was mad to fit him for work by rehabilitation or special vocational training. (*See* also Heart and Heart Diseases; Indians, American Medicine; Nervous System; War Manpower Commission.)

(E. M. Cn.)

Europe.—In all belligerent countries, young men vigorou enough to fight or to work hard were comparatively scarce. Me of particular skills and aptitudes again were needed in greate numbers than were available. But these particular scarcities wer only two of the more important features of a general tightness.

Almost from the start of World War II the German manpowe position was difficult, but the difficulty did not necessarily represent a weakness in the German economy but rather indicated th strength of the German strategic position. Germany was short o men because it entered the war prepared with large armed force and with an industry tooled up to employ men on that vast sca necessary to maintain its powerful offensives. It is noteworth that Italy, the weaker partner, was able to send workers to Germany, for her armament industry was not designed on a bi enough scale to equip and maintain an army that would strain h resources of men.

As Great Britain emulated the warlike effort of Germany, th

ess than .05%.

e signs of stringency made their appearance. As the factories e built to equip large armies, air forces and fleets, greater ed forces could be mobilized at the same time that greater bers could be employed on producing the armament and sups that made their mobilization possible. And into this vast ure of warlike activity each man needed to be placed where contribution to the sombre whole could have its most powereffect.

ot only men were needed but women too. The shortage of forced the substitution of women for men, to free men for jobs which only men can do—primarily, of course, to fight. he United Kingdom this process of substitution was pushed t up to the firing line. Women with the armed forces were only replacing men in sedentary or domestic duties; they were helping to man anti-aircraft batteries, maintain aeroplanes care for the guns of the fleet.

ow was this mosaic of effort fitted together to form a picture otal war? The answer, in general terms, may be put in this . There was selective drafting into the armed forces; there the direction of workers to selected industries; there was the rolled movement of workers from place to place; there was ing to give people more needed skills.

en and women of particular ages were required to register national service either with the armed forces or in industry. Up to Nov. 1942 men between the ages of 18 and 50 and women between the ages of 20 and 45 had registered for employment; and of these, men aged 18 to 41 and women aged 20 to 24 had been called primarily for the armed forces. But these younger men and women were not, even if medically fit, taken as a matter of course into the armed forces. The calling up of a man or woman depended upon the circumstances of his or her case—circumstances known to the ministry of labour and national service who was charged with the responsibility of directing the use of manpower. Inter alia, these circumstances were: the need of the armed forces for men (particularly for men of that individual's calibre and industrial skill); the need of industries of national importance for that man or woman; the shortage or superfluity of labour (particularly of that kind) near that person's home; the possibility of training some other person to do his or her work; the age and suitability of the person for the various branches of the armed forces. In the case of women, the preference of the individual to go into the armed forces or to be placed in essential work was also considered.

It will easily be seen that these were difficult criteria against which to measure the need for a man or woman. And it would be more than surprising if the calling up of men and women were done without mistakes and, even more, without criticism. What can be said is that the method seemed to be sound enough and

at the various local employment exchanges, which were branches the ministry of labour and national service, should have the quisite information to make a better decision than anyone else. The same kind of considerations, together with the personal d domestic position of the persons registered, determined the ections given to the older individuals—*i.e.*, whether he or she s to stay in the present employment; to be moved to some lustry more urgently requiring labour or to some locality where e shortage of labour was particularly acute; or whether because ill-health or domestic ties the person could be allowed to remain the present employment or condition (*e.g.*, as housewife). ally, people could be trained in industrial training centres trolled by the ministry of labour and national service, to learn ne skill for which there was an acute demand, and at the same e receive remuneration comparable to wages earned during ployment.

There are two points which should be made to prevent a false pression. The first is that decisions were not irrevocable. Men d women could be directed to remain at their work to be called later to the armed forces. People could be moved from a ality to which they had been directed. An efficient utilization manpower demanded the ability to examine the position afresh often as conditions changed. This very essential condition was erved. The other, and even more important point was that the ection of labour did not imply the absence of voluntary service, less an unwillingness to serve. It implied that the individual ld not know the sphere in which he would be most useful. And directing people, the government was merely implementing the ire of people to serve.

Finally it should be said that this is a description of the mecha- n of control. The policy which directed it was the policy ch determined the size of the armed forces, the size of muni- industries, the number needed to operate essential civil in- tries and so on. For obvious reasons, nothing could be known this, save the equally obvious fact that more and more people e being directed away from the amenities of life to what were its necessities. (J. Sd.)

lenium. The production of selenium in the United States in 1941 increased 89% over 1940, to 620,500 lb., sales were up 85% to 681,650 lb., while imports in the first e months of the year were 139,500 lb., 4% more than in the year 1940. Canadian production increased, but no statistics e reported. (G. A. Ro.)

rrano Suñer, Ramón (1901–), Spanish statesman, was born in Saragossa. ile studying law in the University of Bologna, Italy, he be- e interested in left-wing political theories. On his return to in he practised law in Saragossa, and in 1933 he became a nber of the cortes as a deputy of the Catholic party. Two rs after the outbreak of the Spanish civil war in 1936, he was pointed minister for press and propaganda in the cabinet of the rgents by his brother-in-law, Generalissimo Francisco Franco. s position gave him complete control over press and radio. In 7 he made a good-will visit to Germany, where he attended Nuremberg nazi congress and met Ribbentrop, Hitler and er ranking nazis. As a result of these visits and his talks with ssolini and Ciano in Italy he succeeded in getting more axis materials for the insurgent armies. On Oct. 18, 1940 he was e foreign minister of Spain. Serrano Suñer tied Spain to the coat tails of the axis in foreign policy, but dependence on Britain for food prevented a rupture with the Allies during 1940–42. On Sept. 3, 1942, Franco revamped his cabinet; Serrano Suñer was ousted from the foreign ministry and replaced by Gen. Francisco Gómez de Jordana. (*See* also Spain.)

Serum Therapy. Serum therapy is the treatment of disease by the use of serums prepared from the blood of animals, including human serum. Serum therapy includes the prevention as well as the treatment of disease, by vaccines as well as by serums or any analogous product. Vaccines and similar products are made from bacteria or viruses killed or changed or extracted or grown so that when injected into a person, instead of causing the disease, they allow him to build up his own immunity against the disease. Serums and products similar to them contain protective or curative properties, natural to the animal or artificially produced in the animal from which they are derived, properties which can be passively transferred to a person by injection under the skin or into a vein.

The most useful vaccine-like products have been smallpox vaccine, diphtheria toxoid and typhoid vaccine. During 1942 there was improvement and development in the use of tetanus toxoid; this had been found effective in the prevention of lockjaw and obviates the use of serum after dangerous injuries, provided one can be sure that the person has previously been immunized with the tetanus toxoid.

Other vaccines which underwent improvement as regards safety or efficacy or both were yellow fever vaccine and typhus vaccine. This was fortunate because both were of importance under wartime conditions. Rabies vaccine, used against lockjaw, was also improved. The use of vaccines against whooping cough received much study, and evidence was accumulating that a considerable degree of protection can be attained by their use.

The most useful serum-like product had always been diphtheria antitoxin. The development of tetanus toxoid may cause a decline in the use of tetanus antitoxin, especially among those who, like soldiers, can wear a tag to show in case of injury that they have been immunized. The greatest decline in the use of serums was in pneumonias due to the pneumococcus. Here the sulpha drugs were supplanting much of the former usefulness of antipneumococcus serums. A similar change took place in the treatment of the previously very fatal meningococcus meningitis.

The greatest recent development in serum therapy was the improvement and wide extension in the use of products made from the blood of man himself—human serum and plasma. Though there was some use for specific serums from persons who recovered, for example, from measles or scarlet fever and hence might be assumed to have protective substances in their blood, it was the more general use of the products from bleeding adults which had the widest attention. These products included human whole blood itself, human serum and human plasma, especially frozen or dried plasma which could be stored and transported for emergency use. These products were much blander, that is, much less likely to cause reactions, than blood from another species such as the horse. They were used chiefly in shock, haemorrhage and severe burns.

Shaposhnikov, Boris Mikhailovich (1882–), Russian army officer, was born Oct. 4 in Zlatoust, Russia. He won a scholarship to the imperial academy of the general staff, was graduated in 1910 at the top of his class and was commissioned an officer in the Czarist army. In May 1918 he offered his services to the red army and was appointed an assistant commissar by Lenin and Trotsky. In 1921 he was awarded the order of the red banner. He served in the red army for 13 years before joining the communist party. In 1937 he became chief of the general staff and a member of the powerful central executive committee of the U.S.S.R. He became generally recognized as the chief strategist of the red army when he succeeded in breaking Finnish resistance in the winter of 1940. In recognition of his achievements in the Finnish campaign, Stalin conferred on him the rank of marshal in May 1940. He was said to have been the author of the three-front plan of defense against Hitler's armies in the German-Russian war, and on Oct. 31, 1941 he was recalled as soviet chief of staff. Shaposhnikov was also said to have contrived the strategy that enabled the Russians to hurl back the nazis at the Volga river and Stalingrad in 1942. National recognition of his achievements was evidenced by the nationwide observance of his birthday on Oct. 4, 1942.

Sheep. The number of sheep and lambs on United States farms at the beginning of 1942 reached an all-time high—55,979,000 head, compared to 54,283,000 in 1941—as reported by the department of agriculture. The 1942 figure was subsequently stated in round numbers of 56,000,000 in governmental reports. The lamb crop of 1942 was estimated at 32,300,000, thus bringing the total number of sheep and lambs in 1942 to 88,300,000 head. The lamb crop of 1941 was 32,900,000 head. This figure added to the number of sheep and lambs at the beginning of the year gave the 1941 total supply as 87,200,000 head.

High prices for lamb and mutton led to large marketings in 1942. As a result the number of sheep on farms Jan. 1, 1943, was forecast as 53,300,000. It was also expected that the lamb crop in 1943 would show a decline. Agricultural department estimates were that it would be 31,200,000 head, or a total supply of 84,500,000 head in 1943. The goal for lamb and mutton production in 1943 was announced by the department of agriculture as requiring the slaughter of only approximately 24,000,000 sheep and lambs. It was decided not to ask further reductions in 1943. Ceiling prices for lamb were put into effect Aug. 1, 1942; for mutton, Oct. 5, 1942. The ceiling on mutton was removed Dec. 3, and there was a sharp advance in retail prices. A new ceiling covering both lamb and mutton was then adopted Dec. 23 for the various grades of carcasses and wholesale cuts. Price differentials were based on 12 price zones covering the United States. (*See* also LIVESTOCK; MEAT; WOOL.) (S. O. R.)

Shipbuilding. Because of the global war and resulting restriction of authorized information, there were no accurate statistics of world shipbuilding for 1942 aside from certain data, American in origin, cleared through official sources. It was obvious, however, that all nations at war and neutral nations as well, wherever practicable, were devoting their utmost efforts to the production of both naval and commercial vessels for purposes of offense, defense and the maintenance of normal trade.

Losses of merchant tonnage due to torpedoing by submarine, aircraft bombing, mines, and other casualties were continuing, and the loss of United States tonnage was particularly heavy after the entrance of that country into the war. The latest reports indicated the sinking of more than 500 vessels as of Dec. 1942. This includes merchant vessels of all types and sizes, but there is no authorized record of losses by tonnage. (*See* SUBMARINE WARFARE; BLOCKADE.)

Detailed information regarding the American naval program could not be released. A statement made by the chairman of the House Naval Affairs committee as of June 30, 1942, however, revealed that at that time there were building 3,230 combatant, auxiliary, patrol and mine vessels for the United States navy; in addition to which, it was stated, the country was turning out 218 more war ships for the allied countries as well as 11,659 vessels, such as harbour craft, barges and small auxiliaries for essential and special needs.

Up to Dec. 1, 1942, 625 seagoing commercial vessels of 6,890,000 dead-weight tons were delivered by the private shipyards of the United States, which was more than six times the deliveries for the entire year 1941—an achievement never previously approached by any nation. President Roosevelt's call early in the year for 8,000,000 dead-weight tons of shipping in 1942 and 15,000,000 tons for 1943 was expected to be met, as the shipbuilding staffs and the facilities of the country were geared to meet this unusual demand. Privately owned shipyards produced both naval and commercial vessels, and the actual output of commercial vessels would depend upon the relative allocation of materials for these two types of craft.

Shipbuilding is a heavy industry. It is dependent for its output on the delivery of materials in the required sequence and when needed, and in the ability of the industry to maintain its productive manpower. Heavy and almost irreplaceable losses of skilled men resulted from enlistments and the draft. An official requirement that recruiting for all war services must be done through the Selective Service system was expected to help control manpower in the shipbuilding industry.

The building time required for merchant vessels was continually reduced during 1942. The average time from keel laying to completion of Liberty vessels, according to the October report of the Maritime commission was 66 days, compared with the original contract requirement of 105 days. The best previous average production time was 70.1 days per ship in September. The reasons for these records of construction were:

(1) The fact that several shipyards were devoted solely to the construction in their yards of large numbers of these vessels, all of one design, so that for the first time in the history of shipbuilding the full advantages of multiple construction were shown;

(2) The layouts of the shipyards building Liberty vessels provided for heavy lifting crane facilities, and large areas between shop and ship, both of which features facilitated pre-assembly; and

(3) A far greater use of welding, which fitted in well with pre-assembly.

The ship-repair yards of the country at times were taxed to their utmost capacity in the repair and reconditioning of damaged vessels. These yards were called upon not only to perform repairs on commercial vessels, for the Maritime commission, private account and vessels for other nations under lend-lease appropriations, but also for the repair and reconditioning of large numbers of naval vessels. This volume of vital, special work was being handled in some cases in the yards also producing new ships. Many ships so seriously damaged as to be reported lost were quickly made seaworthy through the peculiar genius of the men engaged in ship-repair work.

As the naval and commercial building program developed, a large number of the smaller shipbuilding and ship-repairing yards of the United States on the seaboard, Great Lakes and great rivers were called into service for the building of government vessels of smaller sizes, and their expanding output has been of sub-ntial aid to the defense program.

Approximately one-half of the construction cost of a ship was pended for the purchase of materials and equipment used by shipyard in its assembly, thus making the dependence of pbuilding on allied marine industries of the country of partic- r significance. (*See* also SHIPPING, MERCHANT MARINE.)

(H. G. S.)

British Empire.—Owing to the destruction of merchant ships d the shortage of tonnage for commercial work, shipbuilding in 42 occupied a particularly prominent position throughout the rld, but in most countries close secrecy was maintained. Nec- ary for military purposes, its disadvantages were great, partic- rly in causing disquietude and unrest. In Great Britain little inite data were published although the Admiralty announced May that the yards, with 50% fewer hands than during the last r, were turning out 90% more tonnage. Secrecy was main- hed with regard to prices, although private owners who had lered ships stated that the price was 50% above 1939.

This secrecy also encouraged considerable criticism against Ad- alty control, largely political in character and in many in- nces completely disproved by investigation. When the min- y of production was established in February the Admiralty s left with the responsibility of naval and mercantile ship con- uction, repair and equipment.

The redundant yards closed down by the National Shipyard urity, Ltd. during the slump were a constant target for critics; July a prominent trades union official declared that no ship- d which was closed during the depression of the '30s had been pened, whereupon, having constantly refused to answer ques- ns, the Admiralty announced in August that 23 such establish- nts had been reopened, some for repair work only but 12 for building of ships up to 10,000 tons dead weight, and a 13th being prepared. The first of these yards was ready for re- ning in Dec. 1939, but labour could not be found for it until 1. Some of the yards concerned could not be reopened as the s were used for other essential war industries.

The Admiralty's policy was also criticized for rejecting assem- -line shipbuilding, the Tutin system which proposed to utilize nal being the one generally advocated.

Although practically all European yards were unsuited for total ding and prefabrication to the extent possible in the newly nned U.S. yards, prefabrication was growing steadily and er sections were being built on the ground away from the slip- . Certain yards were also used for fabricating ship parts t by constructional engineers, especially on the north-east st; and where practicable, U.S. welding methods were adapted British conditions.

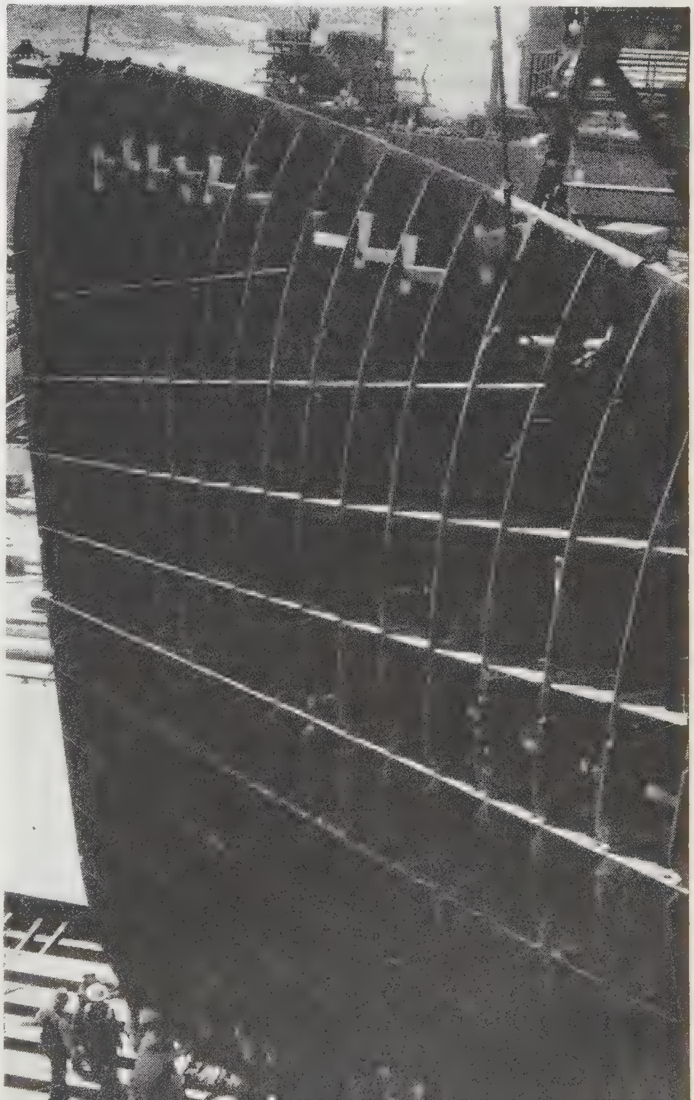
s time and material were saved by repairing a damaged ship ead of building a new one, great attention was paid to the air side, which still employed 50% of British shipbuilding our even after all possible jobs had been diverted to overseas ds. During 1941 numerous ships were kept waiting for repairs, by the beginning of 1942 the facilities had been excellently anized and the waiting list was being rapidly reduced. By May as announced that no ships were waiting, although naturally cedence was given to the ships which could be completed most dly. Several ships which had been cut in two and only part ed had new sections built on remarkably quickly. The repair k to be done tended to increase steadily for various reasons; instance, slower ships compelled to force their engines in order maintain their positions in convoy in bad weather often de- nded engine room repairs and, in the faster ships particularly, r misses by bombs deranged the machinery. The cost of re- rs rose rapidly and steadily, demanding the rearrangement of ernment rates of hire.

The supply of skilled labour caused great anxiety. The previous appeal to ex-shipbuilders to return had disappointing results; many were on other work of national importance from which they could not be spared and others were no longer capable of good work, especially at a height. The transfer of skilled labour to areas where there was a shortage often caused strong feeling which, however, decreased as the organization improved. The shortage of skilled supervisors in particular caused considerable waste, especially in isolated jobs like ship repairs afloat. As conscription was intensified there was shortage of unskilled labour also and cases were reported of ships being delayed through the lack of men to remove the staging and carry out similar work. Transfers from other industries were checked by the Essential Works Orders.

The unions co-operated loyally in arranging for the dilution of labour and the removal of the demarcation rules which had repeatedly checked output. It was the unions themselves, starting with those on the Clyde, which took up this point and contrived a great improvement. Government training centres were established but many were replaced by the shipyards' individual schemes which functioned excellently.

The employment of women in shipyards became a major question, for the shipbuilding industry had not employed women to nearly the same extent as other branches of engineering. Certain yards already employed a number with striking success but others were slower and early in the year the authorities pressed them

PREFABRICATED SHIPS were advocated by Henry J. Kaiser in 1942 to offset the mounting losses of the United Nations at sea. Here is shown a prefabricated double bottom at one of the Kaiser shipyards



WORKERS PERCHED ON SCANTLINGS of the Bethlehem-Fairfield shipyard at Baltimore, Md., to watch the launching of two Liberty ships on Maritime day, May 22, 1942. Nineteen other merchant vessels were launched at other U.S. shipyards the same day

to take full advantage of the new registration of women for wa work. The unions assisted and their minimum wage scale wa adopted by the government—under 21 years of age 19*s*. to 47s a week (on the same scale as boys and youths); 53*s*. 6*d*. fo unskilled, and 62*s*. 9*d*. for skilled workers over 21. The problem of finding jobs for women within their physical capacity wa solved by careful organization; on new construction they prove particularly satisfactory in many sections, and after short instruction did excellent work. On the repair side there was far les scope for women but that was being overcome.

Efforts were made to reduce hours as much as was reasonabl and in June, after experience with new construction, it was officially suggested that the repair works should drastically reduc Sunday labour. The men opposed this and maintained that ther was no evidence that their health had suffered. Absenteeism especially among boys and apprentices, reached serious proportions and the unions became active in checking it. Essentia Works Orders in August assisted them and prosecutions increased There was a regrettable increase in discontent and in unofficia strikes over minor matters, *e.g.*, the alleged unfair treatment o one man, or official delay in considering a grievance. The union strongly condemned these hasty unofficial strikes on trifling grounds, without any effort having been made to use the conciliatory machinery established. The co-operation of the union in securing increased output was most effective, but it laid them open to criticism in some quarters. The shop stewards assumed an entirely new place in British shipbuilding. They formed a important part of the yard committees set up to deal with such questions as could be settled on the spot, and their functions were clearly defined; they were expressly not to interfere with the normal negotiations between the unions and the employers. But in January they started a new policy. A deputation to the house of commons contended that certain difficulties which they could overcome were handicapping production. They were invited t put forward their views and proposals, but their actions in starting a new wages agitation, and in protesting against income tax being charged on overtime, caused very bitter feeling in the unions who accused them of encouraging strikes, while the shop stewards maintained that they had prevented strikes spreading and that the unions had got out of touch with the men. Their motives were not generally discredited but many felt that it was dangerous to permit unofficial interference with the accepted national machinery.

The dominions loyally backed the efforts of the mother country, although at the beginning of the war dominion shipbuilding was almost entirely confined to repairs. Canada made remarkable efforts, on both coasts and on the Great Lakes, and built a large number of warships from big destroyers downwards. Merchant shipbuilding was also revived for standardized ships in two main classes, of 10,000 tons and between 4,750 and 5,000 tons dead weight. Adopting U.S. methods where possible except for using far more riveting and less welding, Canadian yards made rapid progress. On Jan. 1 only one of the 10,000-ton ships had been delivered and five more launched, but by July, 25 ships mostly 10,000 tonners, had been delivered and progress was being accelerated so rapidly that there was every prospect of 1,000,00 tons being delivered during the year. The clever organization which prevented any interruption of production during the ic season was noteworthy; work was arranged so that there was plenty to be done on the slips and in the fitting-out berths until the ice cleared.

In Australia commercial shipbuilding was slower, but the yard were gradually turned over from naval small craft to standardized cargo ships. In Jan., six were under construction out of a program of 60 and soon afterwards the government started a new pro-

m. The general type was a single screw cargo vessel of 9,000 ns dead weight and up to 75% of the workmen were unskilled. few key men were sent out from Britain and a number of for- r shipwrights were found among pre-war immigrants. During year new construction was somewhat checked by urgent re- irs to a large number of vessels which had been damaged by Japanese. For obvious reasons New Zealand was the least ive of the dominions but she had made a start with naval small ft for her own service. In India new construction was prac- ally limited to minor naval types, for which she was able to ld the propelling and most of the auxiliary machinery but had import boilers, electric generators, solid drawn tubes and other ings. South Africa also limited herself to repair work but in autumn it was announced that Henry Kaiser, the American pbuilder, was investigating the possibilities of building near pe Town.

Axis Countries.—All the axis countries strained their ship- lding resources to the utmost. In Germany constructional work peared to have been limited to submarines and the smaller al types, but the industry was regarded as so important that vas made independent of the iron and steel construction group the nazi organization. The necessity of maintaining sea com- nications brought in such an immense amount of repairs that y mercantile construction seemed to have been entirely post- ed until after the war, although there were constant discus- ns over standardization. The authorities desired it to be com- e, for hulls and engines, but the firms fought hard for the t to install the most suitable machinery. Labour was very rt and in the late summer a wireless appeal was made for uits for shipbuilding with preference offered to invalided serv- men. Every effort was made to utilize the resources of the upied countries and Berlin announced that the repair and vicing of U-boats had been transferred entirely to western nce, but otherwise the results were disappointing. Italy made bitious shipbuilding plans, but had difficulty in finding the steel urgent repair and naval work, without undertaking the long- mised reconstruction of the merchant service. Japan also was d with a serious shortage of tonnage and the wooden ship- ding facilities of the occupied territories were carefully inves- ted. A 15,000,000-ton mercantile shipbuilding program was ched with a flourish in May but its difficulties were great.

leutral Countries.—Sweden was the busiest neutral country he continent of Europe, 90% of the orders being for Swedish ers. In July it was announced that 75% of the war losses been replaced, the great majority by new construction, but gress was slow owing to the very poor delivery of steel prom- by Germany. This held up the construction of Swedish ships of the 20,000 gross tons per annum which they undertook to d for Germany. Owing to the shortage of neutral tonnage n Spain and Portugal, where the shipbuilding industries had backward after the introduction of iron hulls, were under- ng the construction of new ships with government assistance.

(F. C. Bo.)

pping, Merchant Marine.

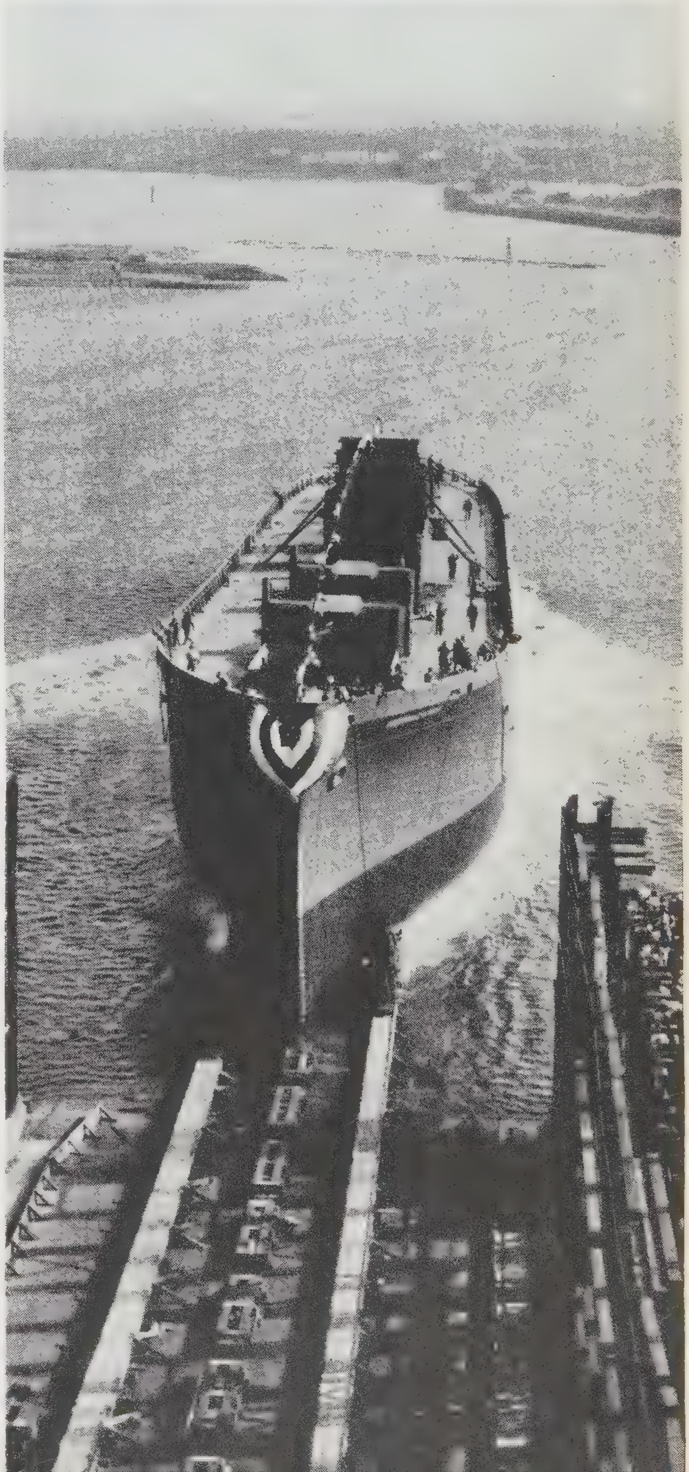
The end of 1942 found the shipbuilding and ship- industries of the United States at grips with problems as prehensive as the war itself. Since the United States was not the principal arsenal of the United Nations but a major ce of fighting manpower, adequate ocean transportation to y continent became an essential ingredient of victory for the d cause.

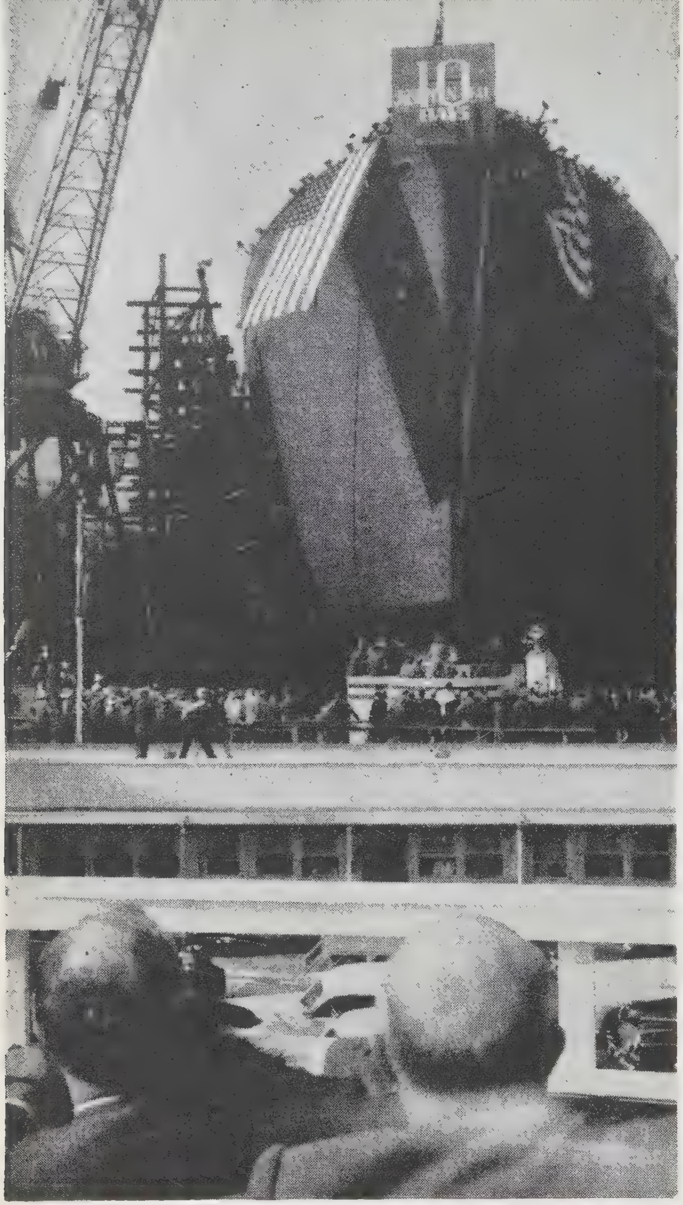
his situation demanded maximum use of every vessel avail- to the United Nations, regardless of ownership or control, construction of additional shipping in unprecedented volume at a production speed far exceeding anything achieved before.

Four main tasks for sea-borne transportation appeared when the United States became involved as a belligerent: (1) moving expeditionary forces to military bases all over the world and keeping them supplied, (2) maintaining the flow of war materials and lend-lease goods to the allies, (3) importing strategic raw materials required by the rapidly expanding U.S. war production, and (4) aiding other nations, particularly the Latin-American countries, in the face of acute economic distress resulting from the dislocation of export and import trade.

To meet this demand the United Nations had available for service an estimated 45,000,000 dead-weight tons of shipping after the United States was drawn into the war. This was greater

TWENTY-ONE MERCHANT SHIPS were launched at U.S. shipyards on Maritime day, May 22, 1942. The picture shows one of the 21, the "Mormacwren," sliding down the ways into Los Angeles harbour





THE LAUNCHING of the Liberty ship "Joseph N. Teal" was witnessed by President Roosevelt (left) Sept. 23, 1942, during his secret U.S. tour. Beside the president is Henry J. Kaiser, owner of the shipyard at Portland, Ore., which built the ship in ten days. Kaiser's firm later lowered the record for launching a new ship to three days

than the tonnage available to the Allies during 1914–18, but in that war supply lines were much shorter and enemy attack by submarine and aircraft was less severe. The transportation load was not nearly so great.

Outstanding among United States accomplishments in the war year 1942 was the construction and delivery of 746 oceangoing merchant ships of about 8,090,000 dead-weight tons, including a number of vessels built for the armed forces. In addition, more than 800 smaller craft of various types were delivered. The shipbuilding industry was faced with a production schedule expanded by presidential directive to at least 16,000,000 tons for 1943. Late in 1941 the directive had been for only 12,000,000 tons in the two years. The tremendous scope of this job is evident when it is realized that American shipyards, under pressure of the defense program, built only 1,160,000 dead-weight tons of merchant shipping in 1941. This demand forced a doubling and several redoublings of the long-range plan of the maritime commission begun in 1937. Under the original peacetime program over-age merchant ships were to have been gradually replaced throughout a 10-year period by fast C-type cargo vessels and high-speed tankers to form a steadily expanding, modern and competitively superior merchant fleet. Since adequate facilities to manufacture sufficient geared-turbine propulsion machinery needed for C-type vessels and tankers were lacking, the EC-2 emergency cargo vessel, commonly known as the Liberty Ship, was adopted as the backbone of the American emergency wartime merchant fleet.

The comparatively simplified Liberty Ship design, thoroughly standardized, encouraged use of mass production methods adapted from the American automobile industry, such as prefabrication, assembly lines, and welding in place of riveting. It also permitted rapid training and absorption of thousands of workers who had no previous shipbuilding experience. The new vessel was powered by triple-expansion reciprocating steam engines, which could be built by many plants throughout the country with proper foundry and machine equipment. There remained the requirement for construction of additional shipyards with sufficient ways to produce these vessels, and this was accomplished under the direction of and financing by the maritime commission.

Under the stimulus of the war, and with this simplified ship design for quantity production, the construction of cargo vessels gathered increasing momentum. In January, 16 vessels, totalling 197,628 dead-weight tons, were delivered. By May this monthly rate was more than tripled in vessel units and in tonnage. In September a new peak was reached with more than 1,000,000 dead-weight tons delivered at a rate of three vessels a day. In December, production rose to four ships a day. The output of 1942 indicated that the 16,000,000 or more tons in 1943 would be well within the capacity of American shipyards, the only limitation being the availability of steel and other critical materials to the shipbuilding "front."

Reduction of building time was an outstanding feature of these production records. Scheduled building time for Liberty Ships, from keel-laying to delivery, originally set at 210 days, was cut 105 days. The shipyards progressively reduced this to an average of 55 days by Dec. 1942. Moreover, tankers were turned out in half the time required a year before, and the construction time for the C-type and other vessels in the program was correspondingly reduced.

An important factor contributing to the speed-up in ship production was the spread of work along the three coasts and Great Lakes as well as among inland factories, in order to tap every source of plant facilities, labour and materials. Thus, more than 70 shipyards and more than 1,200 industrial plants in 40 states employing far in excess of 1,000,000 workers were producing the parts and assembling the vessels that constitute the Victory Fleet.

The details of operating the greatly expanded American merchant marine and of correlating its use with the shipping of Great Britain and of other United Nations were restricted military information. The problem was complicated by the infinite variety of needs of the United Nations, by the tremendous distances involved, by the lack of trained seamen, and by the constant danger of attack from enemy submarine and aircraft. These situations, however, were being met through the comprehensive controls provided through the War Shipping administration in co-operation with the navy.

By executive order No. 9054, Feb. 7, 1942, and amended by executive order No. 9244, Sept. 16, 1942, the War Shipping administration was established and assumed control of operation, repair and manning of the American merchant marine including "all ocean vessels under the flag or control of the United States, except (1) combatant vessels of the army, navy and coast guard; fleet auxiliaries of the navy; transports owned by the army and the navy; and (2) vessels engaged in coastwise, intercoastal and inland transportation under the control of the director of the Office of Defense Transportation."

The War Shipping administration was also directed to "represent the United States government in dealing with the British nistry of war transport and with similar shipping agencies of ions allied with the United States in the prosecution of the r, in matters related to the use of shipping."

The correlation and integration of the activities of the two rine agencies was arranged by appointing a single head for h the maritime commission and the War Shipping administra- n and by utilizing "the services of available and appropriate sonnel of the maritime commission, the war and navy depart- nts and other government departments and agencies which engaged in activities related to the operation of shipping."

btaining required manpower for the expanded American mer- nt fleet was the objective of a program of recruitment and nning which called back to the sea qualified officers and experi- ed merchant seamen who had been working ashore. Registra- n and placement of personnel were based on constant surveys equirements of all American and United Nations vessels. With roximately 125,000 additional officers and seamen needed by end of 1943, the WSA rapidly expanded its program for the ning of young men as merchant marine officers. The U.S. rchant Marine academy at Kings Point, Long Island, two pre- inary training schools at Pass Christian, Miss., and San Mateo, if., as well as five state maritime academies operated with eral aid were engaged in this work. Training of seamen, radio rators, cooks and bakers was carried on at seven U.S. mari- e service training stations operated by the War Shipping ad- istration. It also operated schools where experienced seamen ht study to become officers.

epair and reconditioning of merchant ships likewise became great importance. In addition to the regular overhauling re- red in the operation of the expanding American merchant ma- and that of the United Nations, the repair shipyards were ting many new and severe wartime tasks. Among these were rebuilding of salvaged, torpedoed and otherwise damaged s, the reconditioning and adapting of vessels transferred from cetime service to war operation, and the rehabilitating of laid- merchant vessels of World War I.

See also SHIPBUILDING; WATER-BORNE COMMERCE OF THE TED STATES.) (E. S. L.)

reat Britain.—The merchant shipping of all countries was urally ruled throughout 1942 by national demands and the igerents' attacks on the commerce of one another. The essen- shipping needs of the United Nations were more obvious, but axis powers needed a large amount of sea transport for the secution of their plans, if not for their actual existence. Com- ce destruction by the Allies was not a main purpose of the as it was with the enemy, who engaged in it to check the am of munitions to Britain and Russia, to starve Britain into nission and to prevent the establishment of a second front in ope through lack of tonnage.

ith the intensification of this corsair warfare during the year, hing its peak in early summer, all methods of protecting mer- nt shipping were developed. Despite the policy of secrecy some rmation was released by the censor in order to make the con- ing public realize the great importance of reducing unessen- demands on shipping space. The "catafighters," merchant s fitted with a catapult and fighter planes, were introduced great secrecy in 1941 and developed rapidly in 1942. In e of the expenditure of machines, for a large proportion had e abandoned in the sea, they practically put an end to the ct menace of the big Focke-Wulf machines which had attacked voys far out in the Atlantic, although Focke-Wulfs still sup- d submarines with their information. The defensive arma- t of merchant ships was also steadily improved, both in ngth and efficiency, and the public was informed about the of the maritime regiment of the royal artillery embarked in Allied ships for defensive gunnery duties.

Protective methods did not prevent losses, and the year showed a great development in the life-saving services of the Allies. Few entirely new measures were introduced but a number passed the experimental stage and many which shipowners were only advised to adopt while material was short were made obligatory. The improved equipment of ships' lifeboats, measures to make them conspicuous to rescuing ships, the carrying of at least one motor lifeboat by every ship and the provision of better-planned boats' rations to check thirst, were all contrived during the year. Many ideas, both chemical and mechanical, for making salt water fresh enough to drink were thoroughly tested, but although progress was made the majority of devices proved too heavy; if the weight could be spared it would be better devoted to extra water casks. The ideal is something which is not exhaustible; so far all the devices either demanded fuel or lost their virtue after sweetening a certain quantity of water.

Life-rafts were also greatly improved and the primitive types which were considered suitable in 1939 were quite obsolete. Rectangular rafts were still approved but more were being built to rough boat shape, capable of being towed, rowed or sailed, with far better stability and more protection for their people. The means of calling assistance were also strengthened; in February the British admiralty ordered all foreign-going ships of under 1,600 tons, which had formerly been only bound to carry radio receiving gear, to carry transmission apparatus with a range of at least 75 sea miles.

The British merchant navy shipping pool, which had been adapted to the needs of the other Allied countries, worked smoothly and fulfilled its purpose, although it proved susceptible to fraud. The legal power of the Allied nations to discipline their own nationals in Britain gave the desired results. In all the Allied merchant services the number of volunteers was more than sufficient to replace casualties and to man new ships, although the need for discipline was not always realized. The number of convoys which were betrayed to the enemy by their smoke caused the establishment of better training facilities for ships' firemen and an immediate improvement was noticed.

Both officially and unofficially careful attention was given to the welfare and health of seamen, and the year was conspicuous for the large number of sailors' homes, hostels, recreation rooms and convalescent establishments opened. Special care was devoted to the numerous Asiatic seamen serving in Allied ships; the old type of boarding house was being rapidly replaced by modern hostels, with excellent results, although there was a good deal of trouble with both Indian and Chinese seamen during the year, generally caused by professional agitators spreading rumours of better conditions and better pay in other ships. In their work, and their behaviour in face of the enemy and under great hardship, the Asiatic seamen earned every praise.

From the business side, the greatest shipping event in 1942 was the proposal for the replacement of war losses announced in April. A number of standardized cargo ships were transferred to the Allies and the ministry of war transport put forward a plan for British owners, by which those whose ships had been sunk could register for permission to purchase ships of similar design six months after the end of the war at cost price less depreciation, such ships to be allotted to them for management in the meantime.

The shipping of the enemy-occupied countries, and of Fighting France, continued to do invaluable work in the Allied service on the lines previously established. The Norwegian tankers in particular were singled out for praise.

Axis Shipping.—The comparatively small volume of shipping of other countries which fell into German hands as a result of invasion was employed to the full in the enemy attempt to relieve the strain on the railways, and it was noticed that it was getting the most dangerous tasks while German shipping was being preserved as much as possible. In the North sea, the Mediterranean and the Pacific the toll of axis merchant tonnage engaged on military supply service was very heavy.

Neutral Shipping.—The shipping under most neutral flags was under a control nearly as strict as that of the belligerents and profits were limited, although in many cases the price charged for services was very high. Neutral shipping had not been safe from attacks by axis submarines and aircraft; some "regrettable incidents" destroyed even Spanish shipping on which the axis was relying for so many services. (F. Shoe Industry.

Shoe production in 1942 was reduced approximately 10% from the all-time high production figures of 1941. In the five years ending 1940, the annual production of shoes averaged 409,246,000 pairs. Production in 1941 went 18% beyond that mean level. The rate of production continued in the first half of 1942 on the same scale of gain but then the serious realization that war would play a decisive role, produced a tapering-off of production—so that the final figures were an estimated 440,000,000 pairs (excluding shoes for military purposes) against 1941's grand total of 483,097,000 (excluding shoes for military purposes).

Projecting into 1943, based on estimates of supply, some 12,000,000 to 13,000,000 sides of sole leather were expected to be available, equal, roughly, to some 310,000,000 pairs of shoes. Reclaimed rubber soles, composition soles and wooden soles would probably total 50,000,000 pairs in 1943—unless drastic concentrations and controls were issued from Washington.

The restraining Order M-217, issued in Sept. 1942, cut off all style development and restricted footwear to black, white, blue and three shades of brown. The flow of raw materials into the United States was limited to the shipping situation.

Military requirements for shoes, leather and leather goods, increased tremendously. More than 40,000,000 pairs of shoes were made in 1942 for the armed forces. Large quantities of shoes and extra large quantities of leather were produced and shipped for Lend-Lease. A further drain on the American leather supply was anticipated in the North African and economic warfare projects.

Consumers' purchasing power continued strong through 1942 and civilian consumption exceeded production. A decline in store and factory inventories of 100,000,000 pairs was expected in 1943. The problem of how to curb consumer wants and thereby lead to a decline in production was being met by restrictions and restraints.

Comparative Statistics of U.S. Shoemaking, 1940, 1941 and 1942

Year	Women's	Men's	Misses' and Children's	Youths' and Boys'	Infants'	All Other	Total

*Preliminary.
†Excludes shoes for military purposes.

The world-wide status of shoes and leather was critical. No nation on the face of the globe was able to supply the footwear needs of its people, much less their wants. Military leather and military shoes were imperative. Civilians had to use what remained—even to the scraps and offal. Continental Europe was reduced to the minimum in footwear; repair—with scraps and patches; and in most lands, with wooden soling.

Rubber Footwear.—Crude rubber shortage affected the rubber footwear industry. A pound of real crude rubber was mixed with many pounds of reclaimed rubber and black compounding material so that mass adhesion was possible—from which soles were cut from the pressed sheets.

The decline in automobile use in all lands meant more walking and more wear and tear of shoes. Increased replacing or repairing was necessary. The outlook was not favourable. It was hoped that wild rubber from South America and synthetic rubber would fill part of the footwear needs in the final months of 1943 but there was little prospect of better conditions for civilians for soling or for stormy wet weather wear.

The American factory system and store system experienced no severe shocks or disarrangement in 1942, although quality declined because of government withdrawals of prime ingredients. The financial structure of the industry was at its peak in profits in 1942. (*See* also LEATHER.) (A. D. AN.)

Shows.

Dogs.—In 1941 man's best friend, the dog, fared well even under war conditions. One hundred and three field trials and 220 championship (bench) shows were held, not greatly under the number of 1940. In registrations, the merry little cocker spaniel continued to lead, followed in order by beagle, pointer, Boston, English setter, Scottish terrier, wire-haired fox terrier, dachshund and Pekingese.

The annual market in canned dog food amounting to $60,000,000 evaporated almost overnight with war priorities on tin. Dry or biscuit dog food sought to take advantage of this market.

The outstanding event was the use of dogs officially as part of the armed services. The army had three training camps—Front Royal, Va., Fort Robertson, Neb., and San Mateo, Calif., having trained by the end of 1942 approximately 8,000 dogs. Requirements were one to five years of age and at least 18 in. high at the shoulder.

The most common breeds used were shepherd, Doberman, boxer, great Dane, retriever, Dalmatian, airedale and collie. The marine corps used Dobermans only; training camp, Towson, Md. The coast guard used shepherds only; training camp, Elkins Park, Pa.

The national retriever field champion of 1942 was the black Labrador Shed of Arden. The two outstanding bird dog winners were pointers: (1) Luminary, capturing two national meets; and (2) Titan, capturing both the pheasant and prairie chicken championships. (W. Ju.)

Horses.—The usual annual exhibitions were cancelled in 1942 by the three largest horse and livestock shows—the National Horse show, New York city; the International Livestock Exhibition and Horse show, Chicago, Ill., and the American Livestock and Horse show, Kansas City, Mo. Instead of its picturesque show which had been given for 58 years, usually at Madison Square Garden in New York city, the National Horse show had a one-day show which was chiefly for juniors. It was held Nov. 7 in the 66th st. Riding club, New York city.

There was no large reduction during 1942 in the number of estock and horse shows held annually in connection with the merous county and state fairs. The Kentucky state fair, how- er, was cancelled. In its stead the Lexington Junior League ve a horse show, which, like the National Horse show's one- y exhibition, drew a large attendance. The Dallas, Tex., Charity orse show also drew large audiences Nov. 6 to 8.

At the annual meeting of the International Association of irs and Expositions, and its affiliate organization, the Associa- n of County and District Fairs, Dec. 5, 1942, in Chicago, the quest of the director of transportation relative to cancelling ows was discussed, but no decision was reported. Wayne Dins- re, secretary of the Horse and Mule Association of America, dressed the meeting and recommended that no horse shows be d if horses had to be transported by rail or motor. (S. O. R.)

Livestock.—Conditions brought on by World War II seriously rupted the schedule of livestock shows and agricultural fairs a world-wide basis in 1942. Many of the major events of s type which formerly occurred annually in the United States d Canada were forced to cancel or curtail their 1942 shows, her by reason of the armed forces having taken over the arters in which they were held or, in the United States, by son of the Office of Defense Transportation's request, early 1942, that shows and fairs not add a burden to transportation ilities above the increased load placed upon them in the trans- rt of men and materials directly associated with the war effort.

The National Western Stock show in Denver, Colo., annually ens the calendar year of U.S. livestock shows. This exposition ok place Jan. 10 to 17, 1942. This show, famous for its large mpetitions featuring range-bred feeder cattle and purebred lls of the beef breeds, is an important source of supply for lls required for range service as well as top grade beef calves Corn Belt feedlots each year.

The oldest livestock show of importance in the United States, Southwestern Exposition and Fat Stock show, celebrated its h anniversary in Ft. Worth, Texas March 13 to 22, 1942.

A number of the most important of the U.S. state fairs were ncelled in 1942 because of the loss of their grounds to the army. ese included the Illinois, Iowa, Ohio and Indiana state fairs. nong the important fairs that were able to continue in 1942 s the Wisconsin state fair at Milwaukee, which maintained its ennial position as a major showing of the dairy breeds. With cancellation of the National Dairy show in 1942, the Wiscon- state fair was one of the year's two foremost expositions of dairy breeds.

The other important showing of this phase of the livestock lustry was staged at Waterloo, Ia., from Sept. 7 to 13, when Dairy Cattle congress and National Belgian Horse show ought out full entries in all divisions.

The 1942 Minnesota state fair, combined with the National rcheron Draft Horse show, was held in St. Paul Aug. 29 to pt. 7. Other important midwest state fairs that took place in 42 were those of Missouri, Nebraska, Kansas, Oklahoma and uth Dakota.

The cancellation of the leading U.S. show, the International vestock exposition at Chicago, scheduled for the first week of cember, was announced in May 1942, following the meeting of board of directors. Their decision to cancel was based on the quest of the Office of Defense Transportation.

Shortly thereafter, a substitute fat stock show was announced the same week the International had been scheduled, to ac- mmodate feeders of livestock who already had animals far ng toward preparation for the regular exposition.

The show was called the Chicago Market Fat Stock and Carlot mpetition and was sponsored by the Union Stock Yard and Transit company, operators of the Chicago market. Since the prize lists featured steers, wether lambs and market hogs only—all animals that would ultimately move to market anyway—no burden to transportation was added in holding the show.

With the army occupying the International amphitheatre, it was necessary to stage the show in buildings and pens of the Chicago market. Even on this limited basis, an entry of 6,349 head of cattle, sheep and swine was made by stockmen from 15 states and two Canadian provinces, which although no more than half the size of the full exposition of preceding years, made it nonetheless the ranking livestock show of 1942 in number of entries.

A similar showing, though of lesser size, was held at the American Royal, Kansas City, normally one of the foremost livestock and horse shows in the U.S.

The oldest livestock show in the world is the Highland Agricultural show of Scotland. After 108 years of continuous progress, it had not been held since 1939 because of World War II. The Royal Agricultural show of England, after 98 years, was discontinued the same year for the same reason.

The only show of importance in Great Britain that survived the war was the annual Perth show and sale in Scotland, featuring Shorthorn and Aberdeen-Angus cattle. Beginning Feb. 10, the 1942 Perth show and sale continued for six days, three days each apportioned to the judging and sale of each of the two breeds.

The Calgary Stampede, combining a livestock show with rodeo features, was the major Canadian show of 1942. It took place in July.

The leading South American agricultural show, the Palermo, was renewed in Buenos Aires on Aug. 17, 1942. A ten-day show, the first four days were occupied with judging, from which the general public was excluded; and the remaining six days the public was admitted to view the prize winners on exhibition.

The Palermo is the world's largest annual showing of Shorthorn cattle and is also noted as an exhibition of Aberdeen-Angus and Hereford cattle, as well as sheep. Lesser emphasis is placed on the exhibits of Holstein-Friesians and Guernseys, the principal dairy breeds of Argentina. (W. E. O.)

Sickert, Walter Richard (1860–1942), British painter and etcher, was born May 31 in Munich, Germany. His works, mostly of the impressionist school, hang in the British museum, Tate gallery, the Johannesburg Art galleries and the Royal Gallery of Modern Art at Rome. In 1935 Sickert resigned from the Royal academy in protest against the removal of Jacob Epstein's statues from the British Medical Association building. He died at Bathampton, Somerset, Jan. 23. (See *Encyclopædia Britannica.*)

Silk. In 1942, records of silk production and use were largely limited to reports of new sources of raw silk supply in South America, Bulgaria, southern United States and Central America. No records were available as to Japanese or Chinese operations, although in the latter case before the closing of the Burma road early in 1942, there were reports that silk would be taken out for export to the United States on trucks returning from the transportation of war matériel to the Chinese.

Meagre Japanese reports were to the effect that the mulberry plantings, formerly treasured as food for the hard-working silkworms of Nippon, were being replaced by plantings of food for humans and that boots were being made of silk by a newly invented process which developed a fabric more durable than difficult-to-obtain leather.

In Brazil, it was expected that by Oct. 1942 619 reeling basins would be in operation for the reeling of native grown silkworm cocoons. In 1940 there were only 273 reeling basins. The Brazilian industry, started early in the 19th century by Italian immigrants, since 1936 had shown a rapid decline due to low world silk prices but when the Japanese international situation developed in 1941, silk users in other parts of the western hemisphere became interested in the Brazilian possibilities, centred at São Paulo. The official testing and grading laboratory for the American silk industry, the United States Testing company, established a branch office in São Paulo in 1942, for checking the grading of the reeled silk so as to meet the high commercial standards required in the United States. Both white and yellow silk were produced with a yield of 1 lb. of silk from 10 lb. of cocoons. The 1942–43 crop was estimated as 1,000,000 km., as compared with 300,000 km. for the 1941–42 crop.

India, long a silk producing country, achieved a new status with the closing of the Japanese market. The industry centred in Madras, Mysore and Bengal where at the close of 1942 it was said that with government aid the 1942–43 silk parachute program for the British army would be adequately handled through modernization of reeling, weaving and sewing facilities. All parts of the parachute would be made: fabric, shroud lines and thread. To enable the former home industry to become a modern factory system, it was reported that Rs.18,500 were being loaned. In Madras, the entire venture was government controlled; in Mysore, partly government and partly private ownership; in Bengal, private owners with some government loans.

Lebanon as another source of silk assumed new interest with the North African military developments, for the United Nations. For many years, natives in that area have raised silkworms and with encouragement, one English silk expert said in 1942, the application of modern methods of cultivation and reeling should bring excellent returns.

Another South American venture was reported from Venezuela where producers of cocoons made plans to ship them, unreeled, to the United States for use in manufacturing silk noils, or yarns needed for the production of powder bags, for shroud lines attached to silk parachutes, insulation for electric wires, etc. It was expected that the supply of cocoons would be of great value to the war effort.

Bulgaria was cited by axis sources in 1942 as a promising source of silk supply, even to the extent that its output was surpassed only by Italy in European silk production. The total amount of silkworm eggs produced was 52,000 oz. in 1942, as compared with 39,645 oz. in 1941. The agricultural ministry announced that for 1943 about 80,000 oz. of eggs would be bred. Due to unfavourable climatic conditions, as well as unfavourable prices, cocoon production in 1942 was approximately half of 1941; or 1,500,000 kg. in 1942, compared with 2,364,303 kg. in 1941. The domestic weaving industry in Bulgaria, comprising 12 weaving mills with 600 looms, used the product of 50,000 oz. of silkworm eggs, leaving approximately 30,000 oz. available for export.

But, as far as actual effect on regular silk supplies was concerned, it was estimated late in 1942, that the world's cocoon production for 1941–42 would not exceed 99,000,000 to 110,000,000 lb., as compared with the 1941 world production of 950,000,000 lb. The campaign inaugurated by the War Production board of the United States government to urge the donation of used silk stockings to the government's stockpile indicated that military men did not anticipate any substantial supply of new cocoons to meet the demands for the only product still requiring silk at the end of 1942—the silk cloth for powder bags used to ignite the charges of powder in every big gun. Even there, treated cotton and wool as well as rayon were being developed by the end of the year to give the same no-ash results when burned as silk had long preserved as its exclusive characteristic. (*See also* RAYON; TEXTILE INDUSTRY.) (I. L. BL.)

Silver.

World production of silver decreased by 4% in 1941, to a total estimated at 265,000,000 oz. The recent trend of output is shown in the accompanying table.

World Production of Silver
(In millions of fine ounces)

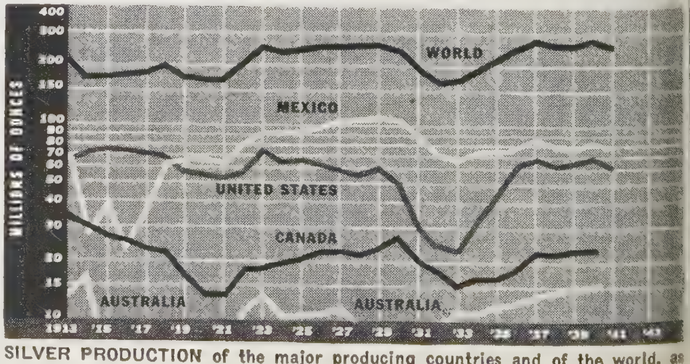
	1937	1938	1939	1940	1941
Canada	23.0	22.2	23.2	23.8	21.8
United States . . .	71.3	61.7	63.9	68.3	65.8
Mexico	84.7	81.0	75.9	82.6	78.4
Other N. America .	4.8	5.0	6.0	6.0	6.1
Peru	17.5	20.6	18.8	19.9	17.5
Bolivia	9.5	6.4	7.2	5.6	7.4
Other S. America .	4.2	4.3	4.7	5.3	5.6
Germany	6.8	7.0	7.0	22.0	?
U.S.S.R.	7.2	8.0	7.0		
Other Europe . . .	7.2	8.5	9.2		
Japan	12.6	13.0	14?	13?	?
Burma	6.2	5.9	6.2	7.0	?
Other Asia . . .	1.9	2.4	1.7	3.4	?
Africa	5.2	5.7	4.7	4.6	?
Oceania	14.8	15.1	15.5	15.6	?
Total	277.7	267.7	265.1	277.0	265?

Reports on current output were delayed from all sources. United States production declined by 8% in 1941, to 65,800,000 oz., and a further 4% in the first eight months of 1942, to a total of 39,141,000 oz. In Canada production through July 1942 was 11,362,600 oz., 5% less than in the same period of 1941, and a slight improvement over the decline of 8% in 1941. During the first quarter of 1942 the Mexican output rose 12% over the average rate for 1941, to 21,900,000 oz. for the quarter, against a decline of 5% in 1941. In Peru the total for the first four months of 1942 was 14,400,000 oz., a decline of 18% from the average rate of 1941, as compared with a drop of only 12% in 1941.

World totals were available only for the first quarter of 1942, with 63,386,000 oz., which continued the 4% falling rate that prevailed for the average of 1941.

Effective Aug. 31, 1942 the official ceiling price for foreign silver was raised to 45 cents per ounce, and the New York quotation was raised from 35.125 cents to 44.75 cents. The price for newly mined domestic silver remained unchanged at 71.11 cents. The London market stood at 23½*d.* throughout the year.

A small amount of silver was offered for sale by the U.S. treasury, to be used in war production, and something like 40,000 short tons of treasury silver that had not been monetized were loaned to war plants for uses from which it could later be recovered, and an additional 7,000 tons were available for such use. Strenuous



SILVER PRODUCTION of the major producing countries and of the world, as compiled by *The Mineral Industry* efforts were made to secure action that would permit the same sort of use for the remaining 66,500 tons of monetized silver, but this was prevented by the senate silver bloc. (*See* also MINERAL AND METAL PRICES AND PRODUCTION.) (G. A. Ro.)

Sinclair, Sir Archibald (1890–), British politician, was born Oct. 22 in London. Educated at Eton and Sandhurst, he joined the army in 1910, but later resigned to enter politics. In 1922 he was elected to Commons as a Liberal party member for Caithness and Sutherland. He was chief Liberal whip, 1930–31, and served as secretary of state for Scotland, 1931–32. After the party split over the issue of joining the Baldwin government, Sir Archibald became head of the Independent Liberals. Blunt and forthright, he thundered against Britain's hesitant stand on the Ethiopian issue nd lashed Chamberlain's appeasement policy. When Churchill became premier in May 1940 he made Sir Archibald secretary of state for air. A year later, when the R.A.F. intensified its raids over Germany, he warned the reich that it would be bombed "night after night until the German people, shattered and disillusioned, decide for the second time that war is not worth while." In the summer of 1942 he pledged more 1,000-plane raids over Germany, but later that year warned that the axis power was not yet broken, and that the "road is still rough and long."

Singapore. Capital of the Straits Settlements (*q.v.*) and the main port of southeastern Asia, located at the intersection of the trade routes to Australia and to India and Europe, Singapore is on an island of the same name, 27 mi. long and 14 mi. broad, off the southern tip of the Malay peninsula. The estimated population of Singapore island (June 30, 940) was 750,805, including 13,962 Europeans, 584,085 Chinese, 5,259 Malays and 59,838 Indians. In normal times Singapore was a port of call for some 7,000 vessels every year; it was one of the principal stops on the shipping lines from Europe to the Orient and an important centre for the transshipment of tin, rubber and other products of British Malaya. Singapore was one of the principal objectives of the Japanese southward drive that coincided with the attack on Pearl Harbor. It was the site of a huge naval base, constructed over a period of 12 years and including a drydock capable of lifting a 50,000 ton battleship, a 200 ft. quay and four square miles of land for barracks. Singapore fell into the hands of the Japanese on Feb. 15, 1942, after a campaign of a little over two months, General A. E. Percival surrendering to the Japanese General Yamashita. The name of the city is derived from the Malay Singhapurra (city of the lion); the Japanese altered it to Shonan (light of the south). (*See* also JAPAN; WORLD WAR II.) (W. H. CH.)

Sin Kiang (CHINESE TURKESTAN). A Chinese province, bounded N. and W. by the soviet union, N. by Mongolia, S. by India and Tibet, E. by China. The name means New Dominion, and Sin Kiang is not an integral part of China, which acquired the territory by conquest in the 18th century. Area, 705,769 sq.mi.; pop. (estimate of Chinese ministry of the interior, 1936), 4,360,020. Other estimates are lower. Capital, Urumchi (Tihwa) (50,000), in the northern part of the country. The two other largest towns, Kashgar (80,000) and Yarkand (75,000) are in the south. Religions: Confucianism, Taoism, Mohammedanism. Governor in 1942 (since 1933) General Sheng Shih-tsai. The Chinese comprise about 10% of the population, and there are 14 other ethnic groups in Sin Kiang, mostly Turki tribes. Sin Kiang is an arid country and the small proportion of land under cultivation is mostly located in oases and river valleys. Its trade gravitated toward the soviet union, after the construc-

THE HUGE U.S. STORES OF SILVER were used for the first time in 1942, to replace copper in electrical products. The picture shows the interior of the vault at West Point, N.Y., as 1,000-oz. bars of silver were being removed for shipment to industrial plants

WOUNDED INDIAN SOLDIERS awaiting admittance to a hospital in Singapore shortly before the fall of the British far eastern stronghold Feb. 15, 1942

tion of the Turkestan-Siberia railway in 1930. Among the principal exports are wool, cotton, furs, skins, sheep, cattle and horses. Among the imports from the U.S.S.R. are machinery and manufactured goods. There were 1,556 schools of all types in Sin Kiang in 1940, with more than 150,000 students. A daily newspaper, the Sin Kiang *Daily News,* began to appear in Urumchi in 1939. Some 4,000 km. of motor roads were built during the decade 1932–42, although there were still no railways in 1942. Industries, which are on a small scale, include spinning, weaving, matches, flour and foodstuff processing. The natural resources of Sin Kiang, undeveloped because of lack of capital and technical knowledge, include gold, iron, copper, oil, coal, gypsum, nitrates and salt, none of them adequately surveyed. The air route from Chungking to Moscow crosses Sin Kiang, with stops at Hami, on its eastern frontier, and Urumchi. An old caravan route was made passable for trucks and furnished a route, through Urumchi, Hami and Lanchow, in Kansu province of China, for Soviet supplies to the Chinese nationalists. (W. H. CH.)

Skiing.

America's recreational skiing enthusiasm, having climbed steadily for ten years, reached its zenith and started coasting downhill with the advent of 1942 wartime restrictions. Cancellations of numerous "snow trains" because of the armed forces' transportation needs was the chief reason for the lagging ski interest. Poor snow conditions, both in the east and middle west, also added to the lack of recreational skiing as a part of America's winter sports program during 1942.

Competitively, skiing went along much as before. Jumping featured three standouts—Ola Aangesen, Torger Tokle and Arthur Devlin. Aangesen, a member of the royal Norwegian air force based at Toronto, dethroned Tokle as national champion in the U.S. title tests at Fond du Lac, Wis. Relying mainly upon form, Aangesen scored 230.2 points with jumps of 191 and 180 ft., while Devlin placed second with 228.15 points. Tokle leaped 194 and 181 ft., longest of the nationals, but his lack of perfect form brought his total only to 227.9 for third place. The Brooklyn Norwegian, however, led the all-season competition by breaking seven records, including the American distance mark. Tokle reset the U.S. distance record with a leap of 289 ft. at Iron Mountain, Mich.

The jumping fraternity also figured prominently in other skiing ventures, although not in their specialty. Alf Engen, former highflyer from Salt Lake City, won the national open downhill-slalom combined championship, although he captured neither the downhill nor the slalom. Martin Fopp, formerly of Switzerland, won the national open downhill, while Barney McLean of Denver and Sig Engl of Sun Valley were tied in the slalom. McLean, a jumper of note, also swept the downhill, slalom and downhill-slalom for amateurs. The third jumper to score in other phases of skiing was Merrill Barber of Norwich university, who captured the intercollegiate four-event championship and the national "all-around."

Shirley McDonald and Mrs. Gretchen Fraser, two young ladies from Sun Valley who learned their skiing at Mount Rainier in the Pacific Northwest, completely dominated the women's nationals at Yosemite. Miss McDonald annexed the amateur downhill, open downhill, combined amateur, and open downhill-slalom titles. Mrs. Fraser won the open and amateur slalom championships. (M. P. W.)

Skin Diseases: *see* DERMATOLOGY.

Skinner, Otis

(1858–1942), U.S. actor, was born June 28 in Cambridge, Mass., the son of a clergyman. At 18 he decided on a stage career, and a year later he played 120 roles with a stock company. From 1884 to 1888, he appeared with the Augustin Daly theatre group in New York, London, Paris and Berlin. Later he joined John Drew and Ada Rehan in another continental tour and then starred with Edwin Booth and Helena Modjeska on the New York stage. In 1894, Skinner organized his own company. His repertoire was wide and varied, and he was soon recognized as one of America's leading actors. His role as Hajj, the beggar in *Kismet,* which opened in New York in 1911, stood out as one of his greatest triumphs. He last appeared before the footlights in 1935. Among his works are his memoirs, *Footlights and Spotlights* (1924); *Mad Folk of the Theatre* (1928); *One Man in His Time,* written in collaboration with his wife, Maud Durbin (1938); and *The Last Tragedian* (1939). He died in New York city, Jan. 4.

Slate.

The production of slate in the United States showed a marked increase in 1941, dimension material rising 17% to 180,990 short tons, while ground material increased 37% to 437,670 tons, a total of 618,660 tons, valued at $7,515,634. Roofing slate makes up 72% of the dimension stone value, and 42% of the total value. (G. A. Ro.)

Slovakia.

A nominally independent republic in Central Europe, formerly a part of Czechoslovakia. Area 14,848 sq.mi.; pop. 2,800,000, of whom the great majority are Slovaks, a Slav people closely akin racially and linguistically to e Czechs. The majority are Roman Catholics, but there is a nsiderable Protestant minority. Capital, Bratislava; chief cities: atislava (123,852); Trnava (24,000); Nitra (21,250). Presi nt (1942): Msgr. Joseph Tiso; premier, Dr. Bela Tuka.

Slovakia came into existence in March 1939 through German lp. In a treaty of March 18, 1939, Germany promised to pro t Slovakia for 25 years, and Slovakia agreed to conduct her reign and military policy according to German wishes. Ger any received the right to occupy Slovakia at any time mili rily. On Nov. 24, 1940, Slovakia adhered to the Rome-Berlin kyo military alliance, and in 1941 declared war against the viet union and against the United States.

During 1942 the nazification of Slovakia made rapid progress. Oct. 22 the totalitarian character of the state was officially oclaimed. The Hlinka party was to be recognized as the only rty and its leader was to receive the title *vodca,* the Slovak rd for *fuehrer.* The Hlinka party, or the Slovak People's party, mprised an armed militia, the Hlinka guards, and a youth or nization, the Hlinka youth. Slovaks living abroad were to be ganized as members in the same way as the German national cialists had built up their foreign organizations.

Many Slovaks protested against the German vassalage and the ti-Slav policy of the Slovak government and were working for reestablishment of the Czechoslovak republic. Leading Slo ks participated in the Czechoslovak government established in gland under Dr. Eduard Beneš.

Among Slovakian exports, timber and wood ranked first, fol lved by matches, iron and paper. The war produced a great de nd for these goods and thus created a relatively favourable onomic situation. Only in 1942 did difficulties begin to make emselves more and more felt, and the government appointed . Karvas, governor of the Slovak National bank, as an economic tator, to regulate consumption and production. A great num of Slovak workers went to Germany. The predominantly arian character and the absence of great cities produced a food uation better than in many neighbouring countries. (*See* also HEMIA AND MORAVIA; CZECHOSLOVAKIA.) (H. Ko.)

nith, Albert William (1856–1942), U.S. engineer and educator, was born Aug. 30 in estmoreland, N.Y. He taught engineering and machine design Cornell, Wisconsin and Stanford universities. He directed bley college, Cornell university, from 1904 to 1915 and was dean the college, 1915–21. He was acting president of Cornell in 20. He was the author of a biography, *Ezra Cornell* (1934), d also wrote *Materials of Machines* (1902), *Poems* (1934), *cing Life* and *A Spring Odyssey on the Shores of the Southern as* (1939). He died in Ithaca, N.Y., Aug. 16.

nith, Sir George Adam (1856–1942), Scottish Biblical scholar, was born Oct. 19 in lcutta. An authority on the Bible and the Holy Land, Sir orge had visited the United States on several occasions, lec ing at Johns Hopkins and the University of Chicago. He was o a representative in the U.S. of the department of public in mation of the British foreign office in 1918. Sir George died his home in Scotland, March 3. (See *Encyclopædia Britan a.*)

nith College. A college for women located in Northampton, Mass. Enrolment for the academic year 42–43 indicated continued interest in the humanities, history, s and languages, but there was an increased registration in thematics and the sciences. A new department of theatre in ded work in acting, designing and radio. War minor courses (in addition to the regular majors) were planned in response to the needs of the army, navy, government and industry. During 1942 there was much extracurricular activity in first aid, home nursing, nutrition, etc. The United States navy was training the first women naval officers, the WAVES, on the campus. For statistics of enrolment, faculty, endowment, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (H. F. D.)

Smithsonian Institution. The institution was founded in 1846 through the bequest of James Smithson, an English scientist, "for the increase and diffusion of knowledge among men." The governing body is the board of regents; the executive officer, the secretary, Dr. Charles Greeley Abbot. The institution administers six government bureaus that grew directly out of its early activities, and also the Freer Gallery of Art; the National Gallery of Art is a bureau of the institution but is administered by a separate board of trustees.

After Pearl Harbor, the institution placed all its activities on a war footing; the secretary appointed a war committee to co-ordinate this work. Engaged in a number of research projects for the army and navy, either at the institution or through transfer of personnel, the scientific staff responded to hundreds of requests for technical information from war agencies; took an active part in setting up the Ethnogeographic board, a clearing house for confidential information to the army and navy on geographical, anthropological and related subjects; initiated several large projects in the field of Latin-American co-operation; began publication of a new series of informative publications on peoples and areas involved in the war; opened its buildings all day Sunday for the benefit of service men; and engaged in numerous other wartime projects.

Special knowledge of the scientific staff of the National Museum was utilized continually in 1942 by war agencies; all types of specimens and irreplaceable material were packed and evacuated to safe places. The museum added 284,582 specimens to its collection, issued 44 scientific publications and held 15 special exhibits.

The National Gallery of Art, in its first full year of operation, had 2,005,328 visitors, a daily average of more than 5,500. Gifts of art works were accepted from eight donors, and seven special exhibitions were held. The National Collection of Fine Arts held eight special exhibitions. The Freer Gallery of Art added many valuable oriental art works to its collection.

A considerable proportion of the 2,523,300 visitors to the National Zoological park in 1942 were men in the armed forces, many of them seeing a large zoo for the first time. Animals in the collection numbered 2,411 in 1942, representing 722 different species.

The staff of the Astrophysical observatory at Washington and the instrument shop devoted full time to several research projects submitted to it by the army and navy. The work of the three solar observing stations in Chile, California and New Mexico was continued, and volume 6 of the *Annals* of the observatory, covering operations from 1920 to 1939, was published. (C. G. A.)

Snook, Homer Clyde (1878–1942), U.S. electrophysicist, was born March 25 in Antwerp, Ohio. After graduating from Ohio Wesleyan university, he taught chemistry and physics and later became electrical engineer for various companies. He was president of the Roentgen Manufacturing company, Philadelphia, and electrical engineer with Western Electric company and the Bell Telephone laboratories. He invented the X-ray transformer and demonstrated an electrical stethoscope in 1926. He won the Edward Longstreth medal of the Franklin institute, 1919, the gold medal of the

Radiological Society of North America, 1923, and the gold medal of the American College of Radiology in 1928. He died in Summit, N.J., Sept. 22.

Soap, Perfumery and Cosmetics.

While the outbreak of war with Japan in Dec. 1941 undoubtedly marked the end of an era in many industries, yet its immediate effect on these three was negligible compared to the steady accumulation of changes wrought after the beginning of war in Sept. 1939. Both 1940 and 1941 witnessed the development of shortages of critical materials, the curtailment of exports, and other profound changes. Again, the elimination of the so-called "excise" tax in late 1941 was the direct consequence of the cumulative pressure on government for increased revenue.

No single thing wrought so profound a change in these industries after the excise tax became law, more than a decade before. For the law had been so interpreted as to create a situation in which it became advantageous for perfume and cosmetics manufacturers to "take in each other's washing" so to speak. Manufacturer A, for example, by doing—not all, but a part of—B's manufacturing could save money for B and make money for himself. B, in turn, could do likewise for A.

One result of this anomalous situation was the mushroom appearance of great numbers of new manufacturies engaged in the "arm's length" production of private-brand or unbranded goods. Elimination of the excise tax in late 1941, among other results, swept most of these enterprises into oblivion.

Government limitation of sales to the level of 1941 also had a far-reaching effect on these industries. It obviously limited competition to those already established in business in 1941. It needed only to be pointed out that the census turnover in a normal year was about five-eighths of the total number of firms engaged in the industry, to make the significance of such limitation apparent.

As an instance of the vagaries of such rulings there was the case of a manufacturer who after long and careful experimentation was preparing to launch a new product, only to be faced with the realization that if he put it out in 1942 his sales would be limited to nine dollars for the year—the sum of his sales on the item in 1941.

By 1942, the necessities of fat conservation did not result in any serious restrictions on the consumption of soaps, even though the soap industry, of course, lost the greater part of its supply sources for vegetable fats. Alcohol became increasingly critical, and as 1942 came to a close, nonalcoholic, solid-based perfumes were beginning to appear in the markets. It was contrastingly interesting to note that in World War I these did not make their appearance until the war was in fact over.

It is patently impossible to make any just or practical assessment of the world position of these industries in 1942. As to their position in continental Europe almost nothing was known. During the year Great Britain discontinued the exportation of nonessential luxuries, previously permitted in the interest of sterling balances abroad.

As the war continued, the limiting of all industrial activity to military and essential civilian production was bound to have further restrictive influences on all three industries. (H. T.)

Soccer.

The Galatin, Pa., Football club emerged from a 79-team field as national open cup champion of the United States. The Galatins defeated Pawtucket, R.I., in the two-game final, 2 to 1 and 4 to 2. Pawtucket was the defending champion. The national amateur championship went to Fall River, Mass., survivor of competition involving 90 teams. The Kensington Recreation Center of Philadelphia defeated the Mercerville Boys' club of Mercerville, N.J., for the national junior championship.

The Philadelphia Americans finally broke the five-year supremacy of the Scots-Americans of Kearny, N.J., to gain the championship of the American Professional league. The Swedish Football club won the National league title, while the Spartas of Chicago captured the International league championship.

(M. P. W.)

Socialism.

Socialism as an organized force made little progress in the year 1942. War conditions led everywhere to an increase and intensification of collectivism. Advocates of democratic socialism argued that the hope of security and the conquest of poverty depend upon social planning and the social ownership and control of basic natural resources and the great monopolies or semimonopolies. They insisted that this does not require dictatorship or acceptance of the god-state. They were also concerned with working out concrete plans for democratic socialism.

This emphasis on democratic socialism was a dominant note at the biennial convention of the Socialist party in Milwaukee in May 1942, and of the party's political campaign in the congressional elections.

On the question of what they should say officially concerning the war, the delegates to the Milwaukee convention were almost evenly divided. Only a small group believed that it was desirable or possible immediately to advocate peace negotiations which, as matters then stood, would have recognized an enormous fascist victory. All delegates were thoroughly anti-fascist; about half of them advocated something they designated as "political nonsupport of the war"; the other half urged what might be called "critical support."

The convention, while failing to pass a clear-cut declaration on this point, adopted, with few dissenting votes, a statement analyzing the causes of war and fascism, and dedicating the party to a struggle for democratic socialism as against fascism and totalitarianism of every type. A program of action was unanimously adopted dealing with various issues pertinent to the war and the peace. Professor Maynard Krueger of the University of Chicago was elected national chairman of the party, Norman Thomas, the previous chairman, having declined renomination.

MAYNARD C. KRUEGER (right) was elected national chairman of the U.S. Socialist party at the party's convention in Milwaukee, Wis., June 1, 1942, after Norman Thomas (left) had declined re-nomination to the office

The comparative weakness of the Socialist party organization-ly, and the growing difficulty of putting minority parties on ie ballot, confined active political campaigning to a few states. either the National party nor the Connecticut party, under the adership of Mayor Jasper McLevy of Bridgeport, Connecticut -run independently of the National party—elected any candi-ite to congress or to important state office.

Socialist sympathy with the labour party idea continued. In ew York state, however, the party put up its own state ticket, hile the American Labor party nominated independent candi-tes for governor, attorney-general and some judicial and other fices. The majority of its nominees were coalition candidates hiefly with the Democrats). The Wisconsin Socialist party n a state ticket independent of the Progressive party with hich it formerly co-operated.

American Socialists who were interventionists before Pearl arbor continued to function in the Social Democratic federa-n which, however, nominated no candidate for office. Many them functioned in the Union for Democratic Action and pported the American Labor party in New York, and, else-here, pro-Roosevelt Democrats. In various states the Socialist bor party nominated candidates on a platform of marxism as erpreted by Daniel De Leon without reference to problems the war except as they would be removed by the establishment their type of socialism, ultimately to be achieved by one big ion of true believers.

In Europe Socialist parties were able to function openly and h comparative freedom only in Great Britain, Sweden and itzerland.

Great Britain.—The British Labour party continued to be rep-ented in the national cabinet. It likewise continued its agree-nt with the other major parties, for the duration of the war, t to run Labour candidates in by-elections in districts which, the last prewar election, had been captured by the Conserva-e or Liberal parliamentary candidates. This policy, however, s nearly defeated at the 41st annual conference of the British bour party in May.

At this London conference and in various committee reports, party during the year made several pronouncements on what uld constitute a Socialist peace and Socialist reconstruction. e conference delegates urged, following the war, "the socializa-n of basic industries and services of the country." In respect India, they called upon "the British government and the ples of India to make a further effort to reach a rapid and isfactory settlement." The Independent Labour party and the rity group within the B.L.P. criticized labour leaders for eged vagueness in postwar aims and for failure to criticize re vigorously Churchill's Indian policy. Sir Stafford Cripps, ocialist, expelled a few years before from the British Labour ty, was replaced, in Nov. 1942, in the war cabinet by rbert Morrison, Labourite, home secretary and minister of ne security. Cripps was thereupon appointed minister of air-ft production. Ernest Bevin and C. R. Attlee of the Labour ty continued in the war cabinet. The Independent Labour ty unsuccessfully ran its secretary, Fenner Brockway, for liament in Wales.

witzerland.—The Social-Democratic party, the second larg- in the nation, continued without representation in the federal ncil, Switzerland's important agency of government, because, Jan. 25, 1942, the party failed to carry a referendum which had vigorously supported providing that the council should elected by the people instead of by parliament. The party d during 1942 about one-fourth of the seats in the national ncil, the lower house of parliament.

weden.—In this country, alone in Europe, were nationwide elections held. But the elections were not for parliament but for city and county councils. Although the total Social-Democratic vote increased over that in the parliamentary elections of 1940 by 120,000, the percentage of popular votes cast for Social-Democratic candidates declined from 53.8 to 50.7. The Social-Democrats remained the dominant force in the councils, with 54% of the membership against 17.4% for the Conservatives and 2.8% for the Communists, both of whom made small gains. In sympathy, Swedish socialism was entirely anti-nazi.

Finland.—Socialists retained representation in the coalition government of Finland, and the Social Democratic party fought as best it could against nazi trends. Its former secretary, K. Wiik, and some other Socialists were arrested for agitating against certain of General Mannerheim's military policies.

Elsewhere on the European continent socialist activities had to be carried on underground. Socialists were represented in some of the governments in exile. In France, prior to its complete occupation by the nazis, the outlawed party managed to maintain enough co-operation between local action committees or councils to draw up a widely circulated manifesto reaffirming its faith in social democracy and calling for a new constituent assembly. In behalf of socialists it offered co-operation with all groups resisting the nazis. Léon Blum's brilliant defense of his party and his government at the Riom trials caused the Vichy government to halt further hearings lest popular sympathy for the defendants should threaten its control and hinder its plans for wider collaboration with the nazis.

It was reported that Blum was removed to Germany after the complete German occupation of all France.

New Zealand.—In late June the Labour government, headed by Peter Frazer, formed a national war administration representing all parties. In the fall after the government took over the chief coal mines for the duration, with workers' representation in the control bodies, the National party asked all opposition members of the war administration to resign. Two did so, the other four did not and the government later won in parliament, 47 to 17, a vote of confidence. A leading New Zealand Socialist, Walter Nash, minister to the United States, attracted attention by proposing a world and regional council for postwar rebuilding.

Canada.—The Co-operative Commonwealth federation (the Socialist party of Canada) gained prestige by electing its candidate, Joseph Noseworthy, president of the Ontario Federation of Teachers, in a parliamentary by-election over Arthur Meighen, former Conservative prime minister.

Chile.—In most Latin American countries, socialism was either not organized or else, as in Argentina, in complete opposition. In Chile the Socialist party officially shared in the election of Juan Antonio Ríos of the Radical party to the presidency after having withdrawn its own candidate, Oscar Schnake, at the end of 1941. At its eighth annual convention the party decided to accept ministerial responsibility under Ríos. It held seats in his first cabinet, and in the second cabinet, formed Oct. 21, socialists headed the ministries of health, justice, land and public works and communications. The party favoured economic co-operation with other Latin American countries, and the defense of South America against any sort of foreign domination. It favoured a break with the axis and co-operation with the United States if the United States would help Chile arm and develop industrially.

Social Security. Only one important amendment of the national social security system was made during 1942, viz., the freezing of the contribution of 1% of wages required of employers and of workers for old age and survivors insurance. Previously, this contribution was to be increased to 2% on each in 1943. No action was taken by congress on the recommendations for extension and improvement of the social security program made by President Roosevelt in his budget message on Jan. 7, 1942.

The status of the various social security systems at the end of 1942 were as follows:

National System of Old Age and Survivors Insurance.—This system had in effect a total of 613,743 awards valued at $11,158,801 on Aug. 1, 1942. Of the total, 543,873 awards, valued at $9,818,274, were to be paid currently, while the balance of 69,870 were subject to deductions of amounts equal to or exceeding the grants for either the current month only or an indefinite period. Suspension of benefits during any month results from the earning of $15 or more in employment covered by the program. The rate of suspension of benefits due to employment had been increasing steadily for more than a year, reaching a total of approximately 10% of all the awards in effect for aged retired persons and for young widows.

During July 1942, $10,369,354 were certified for monthly payments to 551,237 beneficiaries. The greatest proportion of the beneficiaries, 44.8%, were retired insured workers who had attained the age of 65. These 246,841 aged workers were receiving average "primary" benefits of $22.91 at the end of the month. Primary benefits are calculated at 40% of the first $50 of monthly wages (averaged over the period between the end of 1936 and the time of retirement or the attainment of age 65) and 10% more on the balance of the average monthly wage, up to the maximum of $250. To the total thus obtained is added 1% thereof for each year in which the required minimum annual wages have been earned.

In addition to the primary benefits, the system provided 81,895 supplementary beneficiaries with $1,019,096 during July. This group consisted of 71,703 primary beneficiaries' wives, who must be at least 65 years of age to receive benefits of 50% of the primary benefit, and of 10,192 dependent children of primary beneficiaries, who receive the same rates as wives until they reach the age of 16, or 18 if attending school. At the end of July, the average monthly allowance of a wife was $12.22 while that of dependent children was $12.20.

The third group protected by this program comprised 222,501 survivors, who represented 40.4% of all beneficiaries. Of these, 142,840 were dependent children of deceased insured workers, who receive the same benefits, up to the same ages, as children of retired beneficiaries. The 54,282 mothers of these children aided during July are provided with grants equal to 75% of the deceased husband's primary benefits. The same percentage is also paid to widows of insured workers after they have reached age 65, of whom there were 22,787 on the list of certified beneficiaries in July. Only 2,592 parents of deceased beneficiaries were on that list. In order to receive benefits of 50% of the primary benefit, parents must be at least 65 years of age and have been wholly dependent on the deceased worker. At the end of July, the average benefit of the aged widows on the "current-payment status" list was $20.17; that of younger widows with children was $19.54, while benefits to parents averaged $12.98.

If there are no survivors eligible for monthly benefits, a lump sum of six times the primary benefit is provided to meet funeral expenses. In July 1942, $1,186,247 were certified in such payments on behalf of 8,504 deceased workers.

By the end of Aug. 1942, the old age and survivors insurance program had expended $231,763,000 in benefits. Taxes from employers and workers totalled $3,691,034,000 by that date, when the assets of the system amounted to $3,461,811,000. At the end of June 1942, it was estimated that 59,400,000 persons over 14 years of age held account numbers under the system.

Railroad Retirement Program.—In addition to the general retirement system, the federal government operated a special program for railroad workers. At the end of Oct. 1942, there were 158,283 benefits valued at $10,130,794 in force under this plan. Of the total, 127,936 were for railroad employees who retired after the program became effective and 26,540 were for workers previously pensioned by the railroads who were taken over by the Railroad Retirement board. There were also 3,187 survivor annuities and 620 death-benefit annuities in force at the end of October. Employee annuities averaged $65.98 on that date, pensions averaged $58.94 and survivor annuities averaged $32.17. A total of $599,997,300 had been disbursed in benefits by Nov. 1, 1942. At the end of August, $865,783,000 had been received under this program while the available assets on that date amounted to $298,102,000.

Railroad Unemployment Insurance.—The Railroad Retirement board also had charge of the national unemployment insurance plan for railroad workers. Under this plan, 8,642 benefits amounting to $187,823 were certified during Oct. 1942. By the end of that month, the program had accumulated receipts of $337,300,700, accumulated benefit payments totalled $42,158,400 while the balance on hand amounted to $295,142,200.

General Unemployment Insurance.—Under the federal-state system of unemployment insurance for the general population, the 51 state and territorial plans paid out during 1941 a total of $345,707,730 in benefits, as compared with $519,945,914 in 1940 and $429,935,144 in 1939. In 49 of the jurisdictions, 3,311,386 workers received first payments during the year, making an average annual payment of $101.74. The 1941 average was $1.59 above that of 1940 and $17.50 above that of 1939. For one week of total unemployment, the average national payment rose from $10.57 in 1940 to $11.06 in 1941. This average weekly payment fell below $10 in 24 jurisdictions and below $8 in 10 others. Fully 46.7% of the beneficiaries of 47 jurisdictions exhausted their benefits before they were again employed, these exhaustion rates ranging from 19.7 in Michigan to 95.0 in Wyoming. The duration of the benefit payments ranged from 6.3 weeks (Oregon) to 13.1 weeks (Montana) in the 27 jurisdictions for which such data were available. While the benefit payments of 1940 represented 60.7% of the contributions collected that year and the 1939 benefits represented 54.6%, only 34.2% of the year's collections were used in benefits during 1941.

In Aug. 1942 approximately 739,300 different individuals received unemployment insurance benefits amounting to $28,252,116. During the first eight months of 1942, the benefit disbursements amounted to about $283,000,000, 12% more than during the same period of 1941. This increase was due primarily to higher wages and the higher benefits provided by some states. By the end of Aug. 1942, the state unemployment insurance systems had collected approximately $4,943,100,000 in taxes and expended $1,970,600,000 in benefits. As of Aug. 31, the funds available for benefits amounted to $3,099,739,000.

National Employment Service.—Operations of the employment service, which was nationalized in Dec. 1941, showed a total of 5,680,275 placements during the first eight months of 1942, or 31.1% more than in the same period of 1941 and 94% more than in 1940. On July 17, 1942 the active file of the employment service contained 3,254,240 names of persons seeking work.

Public Assistance.—Public assistance payments, provided for persons in need, were made during Aug. 1942, to 2,250,892 aged

,956 blind persons and 930,227 children in 387,176 families. ring that month, the aged received $50,102,706, or an average $22.26 per person; the blind received $2,071,648, or $26.24 person, while the dependent children received $13,364,498, or average of $34.52 per family. In the same month, 550,000 es were provided with $13,310,000 in general relief, an aver- of $24.19 per case. As heretofore, there was great variation the August state averages for the special types of public as- tance and for general relief: old-age-assistance averages ranged m $8.60 in Arkansas to $37.06 in Colorado; aid-to-the-blind erages varied from $9.92 in Arkansas to $46.87 in California; -to-dependent-children averages ranged from approximately per family in Kentucky to $58.90 in Connecticut, while the eral-relief averages ranged from $4.79 per case in Mississippi $38.07 in New York. (*See* also LAW; RELIEF; UNEMPLOY- NT.) (A. BM.)

Great Britain.—There was little change during 1942, owing the impending publication of Sir William Beveridge's report on reconstruction of the social services. (*See* also BEVERIDGE, . WILLIAM HENRY.)

The unemployment insurance fund for the year 1941 showed: eipts £76,600,969; excess over payments £63,858,181; balance ,534,577. Corresponding figures for the agricultural scheme e: £1,513,906; £1,036,158; and £3,858,294. Of expenditure m the general fund, £38,587,007 was applied to redemption of t. The total number of persons registered as wholly unem- yed in Sept. 1942 was 98,662 compared with 230,621 in Sept. 1. The assistance board paid some £4,500,000 from exchequer ds by way of unemployment assistance to unemployed per- s whose needs were not met by unemployment insurance, and persons in distress as a result of the war. The number of such wances in payment in Sept. 1942 was 33,464. The National alth Insurance fund for the year 1941 showed: receipts £45,- ,000; excess over payments £5,723,000; balance £153,920,000. Expenditure on old age pensions was stated to be at the rate of: ,000,000 a year on noncontributory pensions (granted at age subject to a means test); £83,000,000 on contributory pen- s (payable at age 60 women, 65 men) of which £25,000,000 e from contributions. The number of beneficiaries was approx- tely 3,750,000. The assistance board paid supplementary pen- s to some 1,250,000 of these pensioners on proof of need, at ost of £30,000,000 a year up to Aug. 1942 when increased efits raised the cost to £41,000,000. It remained the duty of l authorities under the Poor law to supplement sickness ben- in case of need, and to relieve persons not covered by any e scheme.

THE BEVERIDGE REPORT

Dec. 1942 Sir William Beveridge published his report. It proposed an grated scheme of social insurance based on flat-rate contributions from whole population aged 16 or more without upper income limit; from loyers; and from the state. The plan assumes: allowances for children to age 15, or 16 if in full-time education; comprehensive health and re- ilitation services for prevention and cure of disease and restoration of king capacity, available to all; maintenance of employment, *i.e.* measures the state to avoid mass unemployment or protracted unemployment of viduals.

he report proposes the creation of a ministry of social security to take the administration of health, unemployment and pensions insurance, the k of the assistance board and the duties of local authorities under the r law. One weekly stamp on one insurance document would cover all al insurance. The population would be divided into:

Employees, who would receive unemployment and disability benefit, re- ment pension, medical treatment and funeral grant.

I. Others gainfully occupied, including employers, traders and independen- workers, who would receive pension, medical treatment and funeral t but not unemployment benefit or disability benefit during the first 13 ks of disability. They would, however, receive training benefit to help n find new livelihoods.

I. Married women of working age, insured on marriage through a house- 's policy. All would be entitled to marriage grant and maternity grant all would acquire title to provision for widowhood, separation and re- ment through their husbands' contributions. Those not earning would receive a share of their husbands' unemployment and disablement benefit. Earning wives would draw these benefits on a reduced scale in their own right and be entitled to maternity benefit.

IV. Others of working age not gainfully occupied, *e.g.* students, persons of private means and unmarried women engaged on unpaid domestic duties, who would receive pensions, medical treatment, funeral grant and training benefit.

V. Persons below working age would pay no contributions and would be covered by children's allowances.

VI. Persons retired above working age would be insured for pensions, disability benefit, medical treatment and funeral grant by contributions paid in working years.

Unemployment and disability benefit would, subject to certain conditions as to contributions, be without means test and of unlimited duration, subject, however, in the one case to attendance at a training centre if unemployment were prolonged, and in the other to reasonable steps being taken to effect recovery.

The report proposed benefits calculated upon a subsistence standard as follows. Unemployment, disability and training benefit: 24*s.* for a single person, 40*s.* for man and wife. Retirement pensions: (payable only on relinquishment of work) 14*s.* (25*s.* man and wife) increasing biennially to reach in 20 years, 24*s.* for a single person, man with earning wife or woman with husband under pensionable age, and 40*s.* for man and wife. Persons postponing retirement until after pensionable age: extra 1*s.* (2*s.* for man and wife) for every year of postponement. Widow's benefit: 36*s.* for 13 weeks followed by guardian benefit of 24*s.* in respect of care of children, or training benefit if required. Maternity benefit: 36*s.* for 13 weeks payable to earning housewives in addition to maternity grant of £4. Dependant allowance: 16*s.* for dependants, other than children, of persons receiving any benefit. Children's allowances: 8*s.* for each child when responsible parent is in receipt of benefit or pension, otherwise for each child after the first. Industrial pension: (a) for total disability: two-thirds of weekly earnings, but not more than £3 a week or not less than appropriate disability benefit and dependant allowance; (b) for partial disability: proportionate to loss of earning power. Marriage grant: £1 for each 40 contributions paid by the woman prior to marriage, with a maximum of £10. Maternity grant: £4. Funeral grant: from £6 for children under three years of age to £20 for adults. Industrial grant: payable to dependants of persons dying prior to minimum retirement age as a result of industrial accident or disease. Cases of industrial accident and disease: normal rate of disability benefit for the first 13 weeks followed by industrial pension as above.

The proposed weekly contributions were from 2*s.*6*d.* to 4*s.*3*d.* for class I males according to age, and 2*s.*6*d.* to 3*s.*3*d.* for their employers, the corresponding figures for females being 2*s.* to 3*s.*6*d.* and 2*s.* to 2*s.*6*d.* For class II, 2*s.* to 4*s.*3*d.* males, and 2*s.* to 3*s.*9*d.* females; class IV, 1*s.*6*d.* to 3*s.*9*d.* males and 1*s.*6*d.* to 3*s.* females.

A national assistance scheme subject to a means test would cover all cases where needs were not met by insurance. Approved societies would cease to be organs of national insurance, but a place would be kept for friendly societies and trade unions providing their own benefits to continue as agents for cash state payments of disability benefit. The report recommended that the business of industrial assurance should be converted into a public utility company under an industrial assurance board.

Children's allowances and national assistance would be paid out of taxation; other cash benefits out of a social security fund which would also contribute to the cost of the health and rehabilitation services. A part of the cost of disability arising from industrial accident and disease would be levied on the dangerous industries in accordance with their individual risks. The total cost of the proposals was estimated at £697,000,000 in 1945, rising to £858,000,000 in 1965. The cost in 1945 of existing schemes was estimated at £432,000,000. Of the proposed additional expenditure of £265,000,000 it was estimated that £125,000,000 would fall on insured persons, £54,000,000 on employers and £86,000,000 on the exchequer. The exchequer contribution would rise by a further £161,000,000 per annum by 1965 when retirement pensions reached their full amount. (D. I.)

Social Service. The work of all social agencies, public or private, in 1942 was influenced by the war. This meant not only the creation of a new series of public wartime social services under the Office of Defense Health and Welfare Services, the Office of Civilian Defense and the expansion of private agencies like the Red Cross and the United Service Organizations, but the work of every agency was affected directly or indirectly. First, there was a great change in the general relief situation. Very large funds had gone to public relief every year and in every part of the country for the previous 12 years. The new conditions of employment created by the war brought regular wages into many homes that had been maintained for a long period of time by public relief funds. By Sept. 1942 relief expenditures had declined in 44 states. These expenditures had declined more than 50% in 15 states over corresponding expenditures in Sept. 1940. As compared with Sept. 1941, the declines were still very marked and included such spectacular decreases as 69.3% for Louisiana and 50.6% for Pennsylvania. Over the two-year period, the number of persons receiving relief decreased by more than 50% in 24 states, and only two states—South Carolina (6%) and West Virginia (1%)—showed even a slight increase in the number of relief recipients and in Sept. 1942 total general relief payments had gone down approximately one-third in the U.S. as a whole compared with the same period for 1941, and the number of persons receiving relief had gone down in every state except Alabama (+2.2%), Arkansas (+19.1%) and Nevada (+1.9%). The end of the special federal depression agencies, WPA and CCC, was announced and demobilization was under way. One important change was that the old problem of "transients," or "migratory workers," changed, since they were now welcomed in most areas because of the growing labour shortages. Public opinion was also influenced by an important decision of the U.S. supreme court, *Edwards* vs. *California,* 314 U.S. 160 (1942), which declared unconstitutional a California law making it unlawful to bring into the state a nonresident known to be indigent.

The permanent social agencies, public and private, had serious staff turnovers, with workers leaving for the new war agencies and the calling of men on the staff to the services, and vacancies were increasingly difficult to fill. Registration in schools of social work declined so that fewer new trained workers were available. Volunteers were recruited in large numbers and brief training courses for these new aides were organized. Only a small number of state legislatures were in session in 1942, and there were no major changes in the state welfare organizations. In some parts of the U.S. social workers faced serious problems in connection with the Japanese evacuation, especially with regard to the care of children; but some social services were made available by the War Relocation authority. There were some serious local problems because of the rapid expansion of defense areas, with resulting new social needs regarding care of children, recreation, delinquency, housing, medical services and schools, which the local areas were not able to meet.

In various public and private agencies there was a new emphasis on children's work, on day care for the children of working mothers, concern over reported increases in juvenile delinquency, a new understanding of migratory labour, new problems with immigrants who have sought naturalization in increasing numbers. There was some concern and uncertainty, in spite of the large funds raised for voluntary war social services, about the funds available for regular social services of private agencies. But the funds available for community chests were well maintained throughout the year. (*See* also CHILD WELFARE; RELIEF; SOCIAL SECURITY.) (E. AB.)

Societies and Associations: *see* under specific name.

Sociology.

The science of social relations and structures, "the grammar of the social sciences," made only modest advances in 1942. At the close of 1941 hopes were high that the type of "systematic-quantitative sociology" promulgated by G. A. Lundberg and S. C. Dodd would lead to consolidation of the attested results of previous but presumably less "scientific" researches. These hopes seemed to have been misplaced, for with the publication of S. C. Dodd's grandiose *Dimensions of Society* early in 1942, it became apparent to many sociologists that a mountain had been in labour. Scathing critiques came from the mathematician E. T. Bell and the sociologist Talcott Parsons, but these were relatively brief; the most thoroughly destructive analysis was an article by Ethel Shanas in the September issue of the *American Journal of Sociology.*

Similarly disconcerting was the reception accorded the first two volumes of W. Lloyd Warner's *Yankeetown* series. Sociologists found it analytically inadequate because of Warner's apparent lack of familiarity with the earlier literature in the class-status field, while anthropologists objected to the extreme formalism apparent, in particular, in the volume entitled *The Status System of a Modern Community.* At the same time, it must be said that had it not been for the excessively optimistic advance advertising that Warner's work received, it is likely that criticism would not have been so severe; discrepancies between promise and performance are always harshly judged. Moreover, this advance advertising revived among American sociologists their interest in problems of social stratification, and this revived interest resulted in what virtually amounted to a special "stratification issue" of the *American Sociological Review* in June 1942. The consequent contrast between Warner's loose concepts and more refined types of analysis could not fail to evoke further disapproval of his methods, exemplified in the trenchant article by Oliver C. Cox, "The Modern Caste School of Race Relations," *Social Forces* (Dec. 1942).

Hopes were high that the stimulus to scientific investigation provided by the Fiftieth Anniversary celebration of the University of Chicago (1940–41) would later produce notable results. Here and there progress was made and some reports appeared, but publication in 1942 of the collected papers of sociological import, *Levels of Integration in Biological and Social Systems,* provided only a restatement of the hackneyed and dangerous organismic analogy. Many of the individual papers in the volume are of great value in themselves, but the framework into which they were forced detracts from their merit. Social scientists in general seemed to have profited little by the disastrous record of analogical thinking.

These setbacks fortunately are not the whole story of sociology in 1942. Witness the great improvement in general sociological analysis registered by R. M. MacIver's treatise, *Social Causation.* In this work the author points the way to more circumspect and more fruitful sociological research. Sometimes considered a foe of quantitative method, it seems fair to say that MacIver opposes only statistical dogmatism of the Dodd-Lundbergian type.

From the standpoint of the social psychologist and sociologist, Gordon W. Allport in his *The Use of Personal Documents in Psychological Science* unduly disparages typological analysis because of his interest in the individual personality as developing in a unique time-series. Such an interest in the unique leads away from science and toward Gamaliel Bradford's psychography. It may therefore be said that although Allport makes many shrewd criticisms of opposing schools of thought, he does not fully succeed in establishing his own position. The advocates of life-history and case-study methods in studying the inter-relations of individual and society will have to find a more whole-hearted and methodologically informed representative if their eminently justifiable approach is to get a proper hearing. A step in the right direction was taken by the social anthropologist Morris Opler in his *An Apache Life-Way.* He tried, with measurable success, to avoid mere psychography; his is a social-psychological presentation of sociological rather than psychological derivation.

Of course, the guide-lines for such studies were laid down long before by C. H. Cooley and G. H. Mead. Interest in Cooley was revived by E. C. Jandy's *Charles Horton Cooley: His Life and His Social Theory.* In spite of this, it is still safe to say that American social psychology seemed to be shifting more and more toward the Mead emphasis on the rise of the self in and through a role-taking process using significant symbols, especially those of language.

The year yielded no such crop of sociologically relevant work on language as did 1941, but the 1942 census of current research, published in the August issue of the *American Sociological Review,* plus other sources of information, showed that steady progress along this and other lines was being made. In social psychology, there were such studies as critical evaluation of Mead's concepts of the "I" and "me," social roles of university students, linguistics of assimilation and minority status; in techniques of research, sociometric scales, factorial analysis in radio, various o census sampling innovations, typology of negro personali- s; in population and social biology, internal migration (spon- ed by the Tolan committee), optimum farm population, stim- tion of population growth; in rural sociology, national minority ups in rural Michigan, types of families residing on marginal sub-marginal land; in marriage and the family, class differ- es in parent-child relations, the Japanese-American family in war, campus codes with regard to mate selection; in crim- logy, influence of educational treatment of parolees, prediction juvenile delinquency, criminal careers of former delinquents; sociology of religion, interrelations of "the church" and e world," leadership in the Oxford group; in race relations, extensive Myrdal study, by the close of 1942, almost com- ed.

ut, if one were to take seriously A. G. Keller's *Net Impres- s,* one would have to conclude that little of social-psycho- cal or sociological importance in any field had occurred since death of W. G. Sumner. The biases of the Sumner-Keller ool are fortunately well known; little discouragement will lt from Keller's charmingly written and reminiscent on- ght. Interestingly enough, one of the most striking develop- ts running directly counter to the ultra-conservative Sumner- ler ideology occurred in Great Britain. An International rary of Sociology and Social Reconstruction, under the editor- of the German émigré Karl Mannheim, was announced the publishers of the famous International Library of losophy and Psychology.

ewly emerging fields of investigation made modest but none less definite advances during the year. Sociology of knowl- e was represented by Oscar Cargill's *Intellectual America: s on the March,* the Beards' *The American Spirit: A Study the Idea of Civilization in the United States,* and Logan son's *The Academic Man.* The volume last named, more ctly sociological than the others, develops in detail one aspect Florian Znaniecki's epochal *The Social Role of the Man of owledge* (1940), a pioneer study in substantive sociology of wledge. Sociology of law was represented by the first num- of the new *Journal of Legal and Political Sociology,* appear- under the editorship of Georges Gurvitch. Sociology of gion found a distinguished exponent in Salo W. Baron, whose e-volume treatise *The Jewish Community* is a welcome plement of Max Weber's studies. Sociology of economics is oriously hard to define, and some students would include h work on labour relations in the field. However this may it seems fair to say that F. J. Roethlisberger's *Management Morale* is a valued addition to this area of investigation.

he traditionally accepted varieties of sociological research e not neglected. Race relations had as outstanding contri- ions Graeber and Britt's *Jews in a Gentile World: The Prob- of Anti-Semitism* (with a striking chapter by "Anonymous"), Donald Pierson's *Negroes in Brazil.* So-called "social pathol- " and "human ecology" were given a definitive synthesis in research zone in Shaw and McKay's *Juvenile Delinquency Urban Areas.* Nothing substantially new is provided, but of the research on the interrelations of deviate social conduct ong juvenile and locality patterns is neatly co-ordinated. A ilar synthesis of closely related type is Ernest R. Mowrer's *organization: Personal and Social.* Of textbook rather than monograph character is Donald R. Taft's *Criminology;* its nificance lies primarily in its unabashed espousal of a com- ely deterministic view of criminal conduct. The criminal is t he is, according to Taft, because he can't help it.

ther textbooks of importance published during 1942 were L. and J. P. Gillin's *An Introduction to Sociology,* Kimball ng's *Sociology: A Study of Society and Culture,* L. L. Bernard's *Introduction to Sociology,* John M. Gillette and James M. Reinhardt's *Problems of a Changing Social Order,* Harry Elmer Barnes' *Social Institutions in an Era of World Upheaval,* Howard Becker and Reuben Hill's *Marriage and the Family,* and George A. Lundberg's *Social Research* (rev. ed.). A text called *Principles of Anthropology,* but actually a curious amalgam of ideas gleaned from the social interactionists, both of social-psychological and sociological persuasion, was launched by E. D. Chapple and Carleton Coon; it called forth charges of "academic kleptomania."

Sociology, whether academic or not, underwent many shifts in personnel in 1942. The armed forces absorbed many younger men; wartime agencies in Washington and elsewhere accounted for many more. Social psychologists were being utilized in relation to morale, propaganda and counter-propaganda, aptitude testing and estimating, personnel and guidance work, etc. Specialized anthropological and sociological knowledge of foreign countries and peoples often led to placement in the Office of Strategic Services, the Bureau of Economic Warfare, and the like. Specialists in race relations, particularly when they had unusual linguistic training, occupied many important niches. Social statisticians were widely and indiscriminately used. All in all, the shift from strictly academic to total-war pursuits more than kept pace with the dwindling of college and university enrolment.

Because of transportation difficulties, the American Sociological society did not hold its annual meeting, which for 1942 was to have been at Cleveland. In 1941 a constitutional change had been made which led to balloting by mail, so that elections ran their due course and George A. Lundberg of Bennington college was chosen president. The Sociological Research association, an honorary body much smaller than the American Sociological society, elected to membership Raymond V. Bowers, Kingsley Davis, S. C. Dodd, John Dollard, R. K. Merton, Lowry Nelson, Calvin Schmid, Clifford Shaw, Conrad Taeuber, Clark Tibbits, and W. Lloyd Warner. (H. Bec.)

Sodium Carbonate. Production of natural sodium carbonates in the United States in 1941 increased by 13% over 1940, to 146,677 short tons, all from California. This was only a little over 4% of the amount of sodium carbonate produced by chemical methods from other products. (G. A. Ro.)

Sodium Sulphate. An extended strike in the plant of one of the leading producers cut the output of natural sodium sulphate in the United States in 1941 to 157,524 short tons, a reduction of 16%. During 1942 production capacity was increased by one new plant and by enlargement of another, to offset heavy reductions in imports from Europe. (G. A. Ro.)

Softball. The Deep Rock Oilers of Tulsa, Okla., captured the national men's championship, defeating the Briggs Bombers of Detroit in the final, 2 to 0. New Orleans won the women's championship with a 4 to 1 victory over the Chicago entry. The finals were held in Detroit following a series of elimination tournaments in various parts of the country. (M. P. W.)

Soil Erosion and Soil Conservation.

Drastic changes in agricultural practices throughout the world naturally involved danger to soil resources, but generally, according to information available, the needed shifts in production methods and goals were made with due consideration for the security of the soil. Many agricultural leaders looked upon the wartime upheaval of agricultural practices in the British Isles, the dominions, and the colonies, as an opportunity to end exploitation of the land and to introduce better farming methods.

During the previous 20 years much land had been lost to agriculture in England. The war, however, made necessary the restoration of much derelict land and the improvement of the land under cultivation. As a result, at the beginning of 1942, agricultural leaders in Scotland found little evidence that the fertility of their land had been impaired by the demands of war.

In New South Wales, Australia, agriculturalists believed a change to soil-conserving practices could be made in the wheat-producing areas. In South Africa, the expansion of wheat acreage by high price-concessions, with no restrictions on methods of production for protection of the soil, met with criticism from those interested in conservation.

In the United States many changes were necessary to meet wartime farm production goals. The tremendous increases required in the acreages of soybeans, peanuts, corn, dry peas and beans, flax, sugar beets, and potatoes forced cultivation farther up steep slopes, put under intensive cultivation land that had been in crops requiring little cultivation, and resulted in the plowing up of considerable areas of meadow and pasture.

Efforts were made, however, to minimize erosion hazards. Studies of improved methods of cultivating soybeans and peanuts were under way during 1942. Attention was given to selection of land best suited to the several crops, and farmers were given guidance in working out methods of cultivation that would be least destructive of soil. Extensive efforts were made by farmers and agricultural workers to increase the acreage of cover crops such as the vetches, ryegrass, winter peas, the clovers, lupines and others. The 1942 production of some cover crop seed increased enormously over that of 1941. This was not true, however, of many forage crop seeds.

Another means of meeting the immediate threat to the soil was the program of the department of agriculture to extend to a far greater number of farms the use of such productive conservation measures as cover crops, soil-building rotations, contour tillage, crop residue mulches and proper grazing practices.

Germany's "back to the land" policy employed in settling the occupied eastern territories with Germans in order to hold territorial gains for the future, was coupled with governmental action to minimize soil depletion. Shortages of phosphates intensified the need for continuing during the war all programs for improvement of land under German control.

During 1941 and 1942 legislation affecting soil conservation and land use was introduced in or passed by legislative bodies in New Zealand, Victoria, New South Wales, Queensland, Palestine, the Union of South Africa, East Africa, Rhodesia, Mexico, Colombia, Argentina, Scotland, Northern Ireland and Eire.

In Palestine, Rhodesia and Argentina the adopted legislation permitted or required co-operation in carrying out erosion control works.

From many parts of the world came reports of preliminary steps in erosion control—surveys of soil and land use, research on soil erosion, non-governmental organizations sponsoring better land use, and publications advocating erosion control. These evidences that attention to conservation of soil had not been sidetracked by war came during the year from Turkmen and Uzbek (U.S.S.R.), British Guiana, the British West Indies, Venezuela, Ecuador, Canada, England, Brazil and Java. Notable among these was the Scott Report on Land Utilization in Rural Areas, from England, already accepted as an historical document.

Widespread interest in soil conservation in the Americas was indicated by the resolution on soil conservation and technology adopted at the Second Inter-American Conference on Agricultur in Mexico City in July 1942.

Students from Mexico, Central America and South Americ later came to the United States to study soil and water conservation methods and objectives under direction of the Soil Conservation service.

Plowing up Grassland.—For more than a decade, plowing u grassland to increase wartime production had been in disrepute i the United States. But war again brought the plowing up of som grass in different parts of the world, and in some cases governments were subsidizing it. The Italian government announced campaign for plowing 1,000,000 ac. of grassland, the state assuming 38% of the cost. Scotland extended to March 31, 1942, th subsidy paid for plowing up land that has been under grass for a least seven years.

In the Irish Free State under the Emergency Powers order, th minister of agriculture moved to take possession of land holding where progress was not being satisfactorily made in the require cultivation of one-fourth of the land. Farmers who could no practice a rotational system of tillage were finding the tillag order a serious problem. In Northern Ireland the percentage o land to be plowed was even greater. In England, most of th grassland that was to be put in cultivation had been plowed u by the end of the year. The acreage reached into the millions.

In the United States, several million acres of meadows and pastures were plowed to meet wartime farm production goals. In th United States this was looked upon only as an expedient, no without hazard to the soil.

In England, the situation was different. Land utilization surveys in that country revealed the possibility of drastic revisions i land use, and a permissible increase in arable areas as great a 30%. Furthermore, English farmers were plowing up their grassland as a part of a crop rotation system. They took "the plow 'round the farm." Short-term grass-seedings in rotation with cultivated crops provided some grass and kept the land in shape fo cultivation.

In the United States, although some progress was being made crop rotations in which grass was used were not so commonl followed. A great deal of the increase in the acreage of soybean and corn, where rotations were established, was made by plowing up meadows and pastures at a time when they might not hav been plowed in the regular rotation, had the war not impose extraordinary farm production problems. In the corn belt, plowin up several million acres and planting them to row crops greatl reduced the percentage of land in soil-conserving crops. Rotations for large acreages of these row crops had not been full worked out.

Land Improvement and Reclamation.—In the British Isles where there is less land to fall back on than there is in America drainage for reclamation was a war-time necessity. In England Scotland and Ireland, drainage schemes sponsored or financed b the government were well under way. At the beginning of 194 2,000,000 ac. or more of agricultural land in England had bee improved by drainage. In Northern Ireland grazing lands coul be drained as a part of the Land Improvement scheme, and t bring into production land damaged by flood, a Drainage commission was set up in 1941. In Scotland, lands made unproductive by liability to flood were being protected by arterial drainage works under the Land Drainage act of 1941.

The County War Agricultural committees in Great Britain wer bringing bracken land, heath and moorland into productive use Experiments were under way in improving the grazing areas i the New Forest by removing trees and woody plants, cultivatin and reseeding.

The use of much of the marginal land in Scotland, incidentall ended on adequate liming. Under the Lime Subsidy scheme, government encouraged liming and expanded the production limestone by grants for erecting new plants and improving old s. In Wales, the use of hill land at lower elevations is under erimental study, and grants for clearing have been recomnded.

n the United States, drainage work of the Soil Conservation vice was cut sharply in 1942; the men and materials required the work were needed elsewhere.

he Finnish government guaranteed a premium to every farmer nging waste land into cultivation for his own farm, during a iod of five years beginning in 1941. The Waste Land commisn of the German reich had been studying devastation of land erosion and the use of vegetation as a means of control. In 1 a sum equivalent to approximately $5,000,000 was made ilable for a drainage project in the Morawa valley, in Yugoia.

weden was preparing to reclaim about 1,200 hectares of peat d and 200 hectares of mineral soil to be developed in small dings. Increases in the Danish Land Reclamation fund were le in both 1941 and 1942 for drainage and enclosure of land in dykes. In India, effective means of reclaiming peat soils e being achieved through investigations by the Bengal departnt of agriculture.

n Canada and the United States, reclamation or improvement and in progress was chiefly that continued as a part of prewar grams. Canada's long battle against instability of farm protion in the Prairie provinces, begun with passage of the Prairie m Rehabilitation act, continues. Under this act, the provinces led to grass several million acres of deserted grain farms. Exsive irrigation projects, completed or anticipated, promised to olutionize farming methods in this one-time wheat country.

eeding wheatland to grass was successful in a comparable area he United States, the great plains. Of 47,000 ac. seeded from 5 to 1941, 66% were established, and nearly 90% of the age seeded in 1941 was established.

lanting tree seedlings, to reclaim eroded and abandoned land been completed on more than 100,000 acres by the Tennessee ey authority during the years of its operation.

oil Conservation Districts, U.S.A.—Demonstration projects demonstration farms played no small part in spreading conation in the United States, and some work of this kind coned, but the soil conservation districts were in 1942 the medium ugh which most of the technical assistance given by the states the federal government reached the farmers.

he soil conservation districts, which at the close of 1942 bered 826 in 42 states, were local farmer co-operatives for trol of erosion and conservation of soil and moisture resources. mer-members could receive guidance and assistance from fed, state, and county agencies, and local organizations. In the states which in 1941 adopted legislation authorizing organizaof districts, 22 districts were organized during the first 11 ths of 1942, and the number of districts in other states insed 26.5% during the year. Acreage in districts increased , from 382,629,000 to 479,129,000 acres.

he specific projects which soil conservation districts might ertake are as diverse as the types of farming and the erosion blems within their boundaries. The program of a district was d on soil and land use surveys of the area involved, economic siderations, and the knowledge and experience of local farm ers. Of the area in districts, by the middle of 1942 almost 00,000 ac. had been covered by physical land surveys made he Soil Conservation service. These surveys were sufficiently iled for use in individual farm planning.

n especially valuable part of these surveys in the conservation program was the mapping of cropland in three classes according to the type of cultivation necessary to its continuous use. These land surveys, which served as guides in formulation of district programs, were used by technicians of the Soil Conservation service who gave assistance to the districts and their members in making individual farm plans. The district programs proved to be flexible enough to permit their utilization in the effort to increase production, but the plan of the United States department of agriculture for the widest possible extension of conservation practices both inside and outside soil conservation districts necessitated some temporary reduction in the assistance district co-operators receive on their land from the technicians of the Soil Conservation service. It was planned to extend to as many farms as possible, all yield-increasing conservation practices that could be applied with the least technical assistance and the least expenditure of extra farm labour.

Mexico.—Establishment of a department of soil conservation as a subsidiary of the National Irrigation commission was authorized. The department planned to study soil erosion and formulate plans for erosion control and for the maintenance of soil fertility, on both irrigated and unirrigated areas.

South America.—To carry on research in soils and erosion control a division of soils was established in the newly created Northern Agricultural Institute in Brazil. The division was to classify and analyze soils of the Amazon valley and provide a soil-analysis laboratory for the region. In Chile, establishment of a soil and water conservation research centre was authorized. A law passed in Colombia provided for the creation of a Soil Conservation service in the Ministry of National Economy.

Argentina in 1941 set up a National Land board to promote settlement of agricultural lands, and a soil conservation law was introduced which authorized the ministry of agriculture to determine the utilization of land requisite to colonization. This bill made it obligatory upon landowners or tenants in designated areas to carry out required erosion control measures and even to give notice of the existence of erosion in their own or their neighbours' fields.

The United States Soil Conservation Mission to Venezuela, in co-operation with the Venezuelan ministry of agriculture, made a land-use reconnaissance survey of the agricultural areas of Venezuela. Demonstrations of terracing, strip-cropping, contour cultivation, contour furrows, check dams and farm cropping plans were given.

British West Indies.—In Jamaica neglect of the soil was evidenced by eroded and barren hillsides, which formed the greater part of the cultivated area of the island. One of the main objectives of the agricultural policy of Jamaica was to conserve the soil by reforestation of steep slopes, protection of forest reserves, and anti-erosion practices.

In Trinidad the Lands Advisory committee submitted to the government a report on erosion and erosion control. The depression in the cacao industry and renting out of steep hillsides to the peasants was reported to be increasing erosion, flooding and landslides. A forest policy formally accepted by the government included co-operation with the conservator of forests in all projects for soil conservation and prevention of erosion.

The Philippine Islands.—Cultivation is hazardous in the Philippines because slopes are steep, rainfall is heavy and soils are highly erodible. The short rivers, with steep gradients, carry heavy loads of material eroded from intensively cultivated slopes. On Negros and Luzon, cultivation of sugarcane had been rapidly depleting the soils. In the interior of Cebu, soils had been eroded beyond reclamation.

But cultivation could be carried on in the islands under proper management. In Davao, abaca was cultivated on thousands of acres protected against erosion, and on one rubber plantation in Mindanao, soil conservation methods have been practised for a decade. It was reported that Japan was planning to devote 1,000,000 ac. of land in the Philippines to cotton.

Australia.—In Victoria, erosion control is closely related to flood control. Out of the need to control rivers came the demand for control of land use in catchment areas, where erosion is widespread. Safe disposal of storm water was a problem in more than half of the state. At Dookie college, methods of controlling water erosion were given a trial under various conditions prevailing in Victoria.

The Agricultural Holdings act of New South Wales, proclaimed in 1942, supplanted all previous legislation of a similar character. It recognized that uncertain tenancy is often responsible for inefficiency. It gave a considerable degree of security of tenure, compensation for disturbance of tenure, and, at termination of tenancy, compensation for the unexhausted value of fertilizers and green manure crops and for pastures sown by the tenant. The act was to be administered by the department of agriculture. In the southern tablelands, erosion was serious in many centres, and overstock was great, so that pastures could not be restored without sharp reduction in numbers of livestock. Serious erosion in the wheat-growing areas necessitated diversification. Shelterbelt planting was among the measures advocated to control wind erosion in Western Australia. In Tasmania, sheet erosion was general on developed land, soil creep and land slipping occurred in the higher rainfall areas, and lateral stream erosion was prevalent on many rivers and streams. On these eroding areas, as on areas endangered by wind erosion, little or nothing was done to control erosion. Marram grass was planted to control coastal sand drifts.

China.—On invitation of the Chinese government, Dr. W. C. Lowdermilk, of the United States Soil Conservation service, left for China in the latter part of 1942 to assist that nation in establishing a soil and water conservation service.

The Union of South Africa.—Under the 1941 Forest and Veld Conservation act several forest reserves were established and 80,000 morgen, forming a part of the catchment of Lake Arthur, were proclaimed a conservation area to protect a dam used to irrigate 12,000 morgen of land. Under the act, any severely eroded land might be proclaimed a conservation area, and the state might expropriate farms most severely affected and could ensure that all conservation measures needed on remaining farms be accomplished.

Severe erosion over extensive areas in Natal progressed so far that reclamation will require moving the population.

East Africa.—In Central province, Tanganyika Territory, where sheet and gully erosion are rife, burning of stubble was prohibited by Native Authority rules in some reserves. The stubble is laid on contour banks or in contour rows. Trained instructors were giving assistance in laying out terrace banks on the contour. Planting hedges was recommended to protect crops from wind erosion and to control regeneration of bush.

The belief, held by some in East Africa, that land infested with tsetse flies is free from erosion and that clearing land of the flies introduces the hazard of erosion, was shown to be untenable. Grazing land cleared of bush and put under good grass cover eroded less than it did when covered with bush. Efforts were being made to have grass recognized as a crop and management of grazing introduced. In Teso district, Uganda, where cultivation of cotton led to soil destruction, anti-erosion measures actively adopted included resettlement schemes, strip-cropping, construction of dams, large-scale construction of narrow-base dykes for retarding water-flow, and setting aside of steep hills for reforestation.

Rhodesia.—Experiments with gully control, heretofore seldo undertaken, were successfully carried out on the major soil type of Rhodesia. Erosion and depletion of natural cover brough about a reduction of the water supply in streams and spring Some pasture areas were so severely eroded they must be close for a few years.

Under the Natural Resources act of 1941, soil conservatio work on the native reserves was made compulsory for all, if th majority voted for it. Plans to complete contour ridging in 194 on a 30,000-ac. block of land in one of the native reserves wer forward under the authority granted by the act.

Palestine.—The Flooding and Soil Erosion (Prevention) o dinance, 1941, gives the high commissioner authority to declar any land to be a "special area." In such areas the pasture an passage of all domestic animals, the cutting, burning or remova of any vegetation may be prohibited or regulated. (*See* als AQUEDUCTS; DAMS; DROUGHT; IRRIGATION.)

Somervell, Brehon Burke (1892–). U.S. army off cer, was born May 9 in Littl Rock, Ark., and was graduated from West Point in 1914. H studied at the Army Engineers school, Washington, 1916–17, a the Command and General Staff school, Ft. Leavenworth, 1922 23, and at the Army War college, 1925–26. During World War he was a divisional chief of staff of personnel and operations o the western front, 1918–19, and was assistant chief of staff supplies of the American occupation force in Germany, 1919–2 During the postwar years, he supervised a number of civilia engineering and construction projects in the United States an in Europe and was WPA administrator for New York city, 1936 40. He was made assistant chief of staff in charge of the arm supply division on Nov. 25, 1941, and supervised the shipmen of supplies to U.S. armed forces all over the world. On May 2 1942, he headed a military mission that went to England to stud supply problems. When President Roosevelt reorganized the arm and air force on a "streamlined" basis March 2, 1942, Lt. Gen Somervell was made commander of the army supply service He was named to the production executive committee, create late in 1942.

Soong, T. V. (1894–), Chinese statesman, was born Shanghai, the eldest son of Charles Jones Soon wealthy Bible publisher, and the brother of Mme. Chiang Ka shek. He attended Vanderbilt university, Harvard and Columbi where he specialized in economics, and later he worked in Ne York banking houses. On returning to China in 1917, he worke as adviser to a large coal company in Shanghai; six years later, ame director of the department of commerce with the Nation- government established in Canton. When Soong became nce minister in 1928, he established many economic reforms introduced a budget system, central banking and unified cur- y. He quit this post in 1933 and organized a brokerage firm ugh which he hoped to check Japan's economic exploitation hina. He founded the Bank of China in 1936, later becoming ident. On Dec. 23, 1941, Chiang Kai-shek appointed Soong ign minister while he was in Washington as special envoy rep- nting his country on the Pacific War council. He signed a -lease agreement with Secretary of State Hull in June 1942 returned to Chungking late in October, when he formally office as foreign minister.

uth Africa, The Union of.

A self-governing dominion of the British com- wealth of nations. The four provinces of which it consists, Cape of Good Hope, Natal, the Transvaal and the Orange State, extend from the southernmost point of the African inent to the Limpopo in the north. The former German ny of South-West Africa (pop.: European 33,600; Bantu and ured 287,731) is administered under mandate as an integral of the union, but this territory has not been incorporated as a ince. Area 472,550 sq.mi. (incl. Walvis bay, 430 sq.mi.); pop. June 30, 1941), 10,521,700 (Europeans, 2,188,200; Bantu, 0,700; Coloured, 844,400; Asiatic 238,400). Chief towns . census 1936): Cape Town (seat of legislature; 344,223); nnesburg (519,384); Durban (259,606); Pretoria (seat of rnment; 128,621); Port Elizabeth (109,841). Governor gen- (1942): Rt. Hon. Sir Patrick Duncan; languages: English, kaans; religion: European population: Christian (Dutch Re- ed Churches 55%; Anglican, 19%; Methodists, 6%; Presby- ns, 5%).

istory.—During 1942 the union began to feel the weight of war for the first time. Its troops suffered loss during the first cisive British advance into Libya, and shipping was sunk in h African waters. Union troops helped to occupy Vichy- rolled Madagascar (May-Nov. 1942). (*See* World War II.) prime minister, Field Marshal Smuts, called for 7,000 men to he gap, and soon had 10,000 from a small European com- ity of about 2,200,000, which, in spite of the fact that one- l was opposed to the war policy, had already raised a volun- army of 150,000, besides 73,000 women for the army and iary services, and great numbers of Cape Coloured folk, Bantu ives) and Indians for service as a rule in a noncombatant city. Smuts met Winston Churchill in Egypt (Aug.) and ned home to urge that North Africa be made the base for ffensive in 1943 against Hitler's Europe. He then went to lon to join the war cabinet and (an unprecedented honour) ess both houses of parliament.

nuts's absence from home had been made possible by a work- majority of 20 in the house of assembly and the steady swing to his side of Afrikaner opinion. Ministerialists had won nine of 12 by-elections with a majority of 35,000 to 20,000, in of the capital made by the opposition of the premier's prom- o arm the Bantu in the event of a Japanese invasion. The sition was bitterly divided against itself. Nicolaas Havenga's l neutrality Afrikaner party usually stood aside; but Dr. el Malan's Nationalists were at feud with Oswald Pirow's ied New Order party, which had won the surprising support of ex-premier James Hertzog, and, outside parliament, with the Nazi-minded *Ossewabrandwag* which had the open support of Dr. Goebbels. The chief bonds between these factions were a hatred of the prime minister and all things British, and a fond belief that the expected German victory would be followed by the recognition of an exclusively Afrikaner republic. Meanwhile the government checked sabotage and bomb-throwing by the imposition of the death penalty.

Japan's participation in the war, coinciding with a poor harvest, led to the appointment of a food controller and the beginning of rationing, no easy matter in a mixed community with differing standards of living. The budget for 1942–43 anticipated an expenditure of £140,000,000, of which £88,000,000 was to be raised by taxes including a 20% income tax surcharge, levies on speculative land sales and trading profits in addition to the now familiar excess profits duty, and the increase from 16% to 20% of the gold mines' special contribution. No difficulty was foreseen in raising the remainder by borrowing, for trade was vigorous. The United States was taking Great Britain's place as chief supplier, and the gold output had reached a record of £120,000,000. Fears for the future of gold were aroused by the wholesale extension of lend-lease after the United States became a belligerent, and doubts of the advisability of maintaining at full pressure an industry which absorbed 44,000 Europeans and 350,000 others besides much precious steel and explosive. In view of postwar possibilities it was well that the union's secondary industries were developing so rapidly.

Parliament gave these industries encouragement, besides passing much useful legislation on unemployment, rents, wages, hire-purchase, insurance, banking and war pensions. The government also set up a social and economic planning council, inspired doubtless by the premier's bold statement that the policy of segregating the Bantu had failed and that South Africa must do far more for the health, education and general well-being of the non-European majority of her population. Something had already been done with the approval of those many Europeans who were impressed by valiant Russia's handling of her racial problems and the difficulty of squaring the union's colour bar policy with the Atlantic Charter. In view of the union's growing influence in Africa, these tendencies were of the first importance for the future of the continent. (E. A. Wr.)

Education.—In 1939: State and state-aided primary and secondary: European schools, 4,014; scholars, 391,056; non-European

PREMIER JAN CHRISTIAAN SMUTS of South Africa addressing parliament during his visit to Britain in Oct. 1942. At his immediate left is Winston Churchill schools, 5,131; scholars, 620,384; universities, average number of students, 10,505.

Banking and Finance.—Revenue, ordinary (1941–42) £76,600,000; expenditure, ordinary (1941–42) £76,300,000; public debt (Feb. 28, 1942), £381,000,000; notes in circulation (June 19, 1942) £30,600,000; gold reserve (June 19, 1942) £56,200,000; exchange rate (average 1942) £1 SA = $3.98.

Trade and Communication.—External trade (1940) (exclusive of goods in transit and of gold bullion and specie): imports (total) £105,099,234; exports (domestic) £28,562,207; re-exports £5,528,430. Communication and transport: roads fit for motor traffic (1938–39) 87,495 mi.; railways, including South-West Africa (March 31, 1940) 13,645; airways, including South-West Africa (1939) passengers carried, 35,578; freight and mails carried, 2,640,984 lb.; mileage flown 1,751,453; shipping (1940) entered, 6,598; net tonnage 25,504,068; cleared, 6,554; net tonnage 25,315,168. Motor vehicles licensed (Dec. 31, 1940): cars and taxis, 317,958; vans and trucks, 51,215; tractors 1,044; cycles 21,725; wireless receiving set licences (1940) 283,119; telephones, instruments in use (1940) 202,753.

Agriculture, Manufacturing, Mineral Production.—Production (1940–41) (in metric tons): gold fine (1940) 436,895 kg.; diamonds (1939) 1,269,828 metric carats; maize 2,159,100; coal (1940) 17,493,000; sheep, number (Aug. 31, 1939) 38,289,430; cattle, number (Aug. 31, 1939) 11,852,736; wool (1940) 125,000; wheat, European cultivation 466,800; cane sugar, refined 467,800; iron ore (metal content) (1940) 396,000; pig iron and ferro-alloys (1940) 304,000; steel (1939) 314,000; silver (1940) 40.2; manganese ore (metal content) (1940) 174,500; chrome ore (chromic oxide content) (1940) 73,300; asbestos (1938) 21,900; wine (1938–39) 1,555,000 hectolitres; tobacco (European cultivation) 13,800; potatoes (1938–39) (European cultivation) 196,800; oats (European cultivation) (1939–40) 80,700; barley (European cultivation) (1938–39) 20,500; mohair (1940), export, 1,900; copper (smelter production) (1940) 13,600; ground-nuts (1938–39) (European cultivation) 13,500; benzol (1939) 1,700; superphosphates of lime (1937) 164,000. Industry and labour: (census 1939) establishments 9,837; employees, European, 117,056; others, 189,087; value of gross output £172,764,000; value added to materials used £85,108,000. Employment index (average 1929 = 100) average 1941, 164; Feb. 1942, 172.

South America: *see* ARGENTINA; BOLIVIA; PERU; ETC.

South Australia. A state of the Australian commonwealth 380,070 sq.mi. in area, bounded by longitudes 129° E. and 141° E., and by latitude 26° S. and the southern coast of the continent. Population (est. Dec. 31, 1941) 605,689. Chief city and capital (pop. Dec. 31, 1940), Adelaide (330,000). Governor (1942): Sir Charles Malcolm Barclay-Harvey.

History.—The Country party government under the premiership of Thomas Playford continued in office throughout 1942. Its policy was to give the utmost possible support and assistance to the federal administration in its prosecution of the war. Some of the largest munitions works in the commonwealth were located in South Australia, and the state-owned railway workshops provided a steady output of tools and lathes which formed the nucleus on which many of Australia's most important war industries were built. One of the measures introduced by the state government to relieve the acute manpower shortage was a complete ban on racing.

The state budget showed a surplus of £A1,287,000 for 1941–42.

Education.—In 1939: state primary schools 1,004; teachers 2,556; average daily attendance 55,672.

Finance.—In 1941–42 revenue £A15,002,000; expenditure £A13,715,000; debt outstanding (June 30, 1941) £A109,780,000.

Communication.—Roads (March 31, 1940), 23,848 mi. fit for motor traffic; railways (1941), government 2,558 mi. Motor vehicles licensed (March 31, 1942): cars 52,592; trucks 23,894; cycles 6,165. Wireless set licences (March, 1942) 137,141.

Agriculture and Manufacturing.—Wheat (1941–42), 31,500,000 bu.; barley (1940–41), 5,350,000 bu.; grapes (1938–39), 150,608 tons; currants (1939–40), 208,930 cwt.; wool (1940–41), 107,000,000 lb.; butter (1940–41), 21,379,639 lb. Industry, 1941: factories 2,230; employees 50,844; gross value of output £A43,600,329; unemployment (March 31, 1942) 1.0%. (W. D. MA.)

South Carolina. A south-Atlantic state of the United States, and eighth of the original 13 to ratify the constitution, 1788; popularly known as the "Palmetto state." Area, 31,055 sq.mi., including 461 of inland waters; pop. (1940) 1,899,804; white 1,084,308; Negro 814,164; others 1,332; 75·5% rural; 24·5% urban; 0·3% foreign-born. Capital, Columbia (62,396). Other cities include Charleston (71,275); Greenville (34,734); Spartanburg (32,249).

History.—J. E. Harley, who became governor Nov. 4, 1941, on B. R. Maybank's resigning to enter the U.S. senate, died Feb. 27, 1942; he was succeeded for the rest of 1942 by senate president R. M. Jefferies. The 1941 law enacting prohibition if the 1942 legislature provided taxes fully replacing liquor revenues lapsed because of no such action. Other defiances of heavy referendums for prohibition were manifested by the legislature and by the state Democratic convention's refusal to endorse them, though Gov.-elect Olin D. Johnston (elected Nov. 3, 1942) strongly supported prohibition. Extension of the parole system, slum clearance, low-cost housing (especially for war workers) and, in two counties, old age teachers' pensions, were enacted. Farmers of South Carolina voted 91% for continued cotton acreage control. The $57,000,000 federally financed Santee-Cooper navigation and power plant began operations Jan. 31, 1942 and by December was producing 2,000,000 kw.hr. a day, exceeding its planned annual 700,000,000 kw.hr.

OLIN D. JOHNSTON, Democrat, elected Nov. 3, 1942, as governor of South Carolina

Education.—Enrolment in white elementary schools for the year ending June 30, 1942, was 188,300; Negro 191,553; high schools, white 74,280; Negro 21,077. White elementary teachers 6,432; high school 3,324; Negro teachers 1,755 and 1,329 respectively; expenditures $16,253,912 for whites, $3,233,856 for Negroes.

Public Welfare, Charities, Correction.—State and federal funds of $3,249,000 were allocated for needy persons during the year ending June 30, 1942; $3,544,000 for the following year. There were on June 30, 1942, 16,009 persons on the list certified to WPA. Unemployment payments during June 1942 were $140,649, 22% more than in June, 1941, war production curtailment being mainly responsible for the increase. On June 30

, patients in the state hospital (for mentally diseased) bered 1,278; on parole, etc., 782; feeble minded school 829; tentiary 1,216; boys' reformatory 274; girls' 77.

ommunication.—Paved highways on June 30, 1942, com- ed 7,156 mi.; earthen state highways 4,445 mi.; railroads 3 mi. Long distance air routes with commodious airports ersed the state.

nking and Finance.—On June 30, 1942, 22 national banks s 19 branches) and 87 state banks (plus 4 branches) and cash depositories had deposits and resources as follows: onal banks $155,688,000 and $167,964,000; state banks and ositories $71,710,424 and $81,146,491. Resources of federal ling and loan associations totalled $25,330,215; state asso- ons $12,162,527. The state treasury received for the year ng June 30, 1942, $40,273,124, of which $16,043,393 was the gasoline tax. The state debt was $71,700,000 ($64,- 565 for highways). Gov. Jefferies favoured applying the lus of $5,700,000 to the state debt. Federal internal revenues lled $47,928,257. Imports (1941) were $6,074,303 and exports 08,753.

griculture.—The value of crops in 1942 was $193,482,000, ested from 4,897,350 ac. ($7,808,000 being from vegetables 81,350 ac.). Forests under organized protection totalled 0,846 ac.; fires burned 143,450 ac. Some 10,300,000 seedlings planted.

ole I.—*Leading Agricultural Products of South Carolina, 1942 and 1941*

Crop	1942 (est.)	1941

hes, bu.	3,500,000	3,471,000

anufacturing.—The total value of manufacturing for the ending June 30, 1942, was $855,676,252; employees num- d 167,331; wages were $166,306,969.

Table II.—*Principal Industries of South Carolina, 1942 and 1941*

Industry	Value, 1942	Value, 1941
iles	$623,870,751	$382,753,951
ber and products (boxes, paper pulp, etc.)	61,116,950	43,068,270
tricity	23,080,314	19,061,100
hing	15,341,032	10,343,604

ineral Production.—The value of mineral products in 1942, ly stone and clay, aggregated $4,573,627. (D. D. W.)

th Dakota. A north-central state, admitted to the union Nov. 2, 1889; popularly called the "Coyote ." Area, 77,615 sq.mi. (land area, 76,536 sq.mi.); pop. 0), 642,961; urban population, 158,087; rural population, 374; average number of inhabitants per sq.mi., 8.4. Capital, e (pronounced "Peer" by South Dakotans) (4,322). Largest Sioux Falls (40,832). Ten cities had a population above 0 in 1940.

istory.—In addition to retaining complete control of the state inistration in the election of Nov. 3, 1942, Republicans won sole congressional seat held by Democrats. In a listless cam- n, incumbent Governor Harlan J. Bushfield was elected to the ed States senate over former Democratic Governor Tom y, who had defeated Senator W. J. Bulow in the primary ion. Congressmen Francis Case and Karl Mundt won re- ion handily. Nominated in convention after a four-man con- in the primary had failed to produce a Republican guber- rial nominee, M. Q. Sharpe, former attorney general, carried the whole state ticket to victory in the November election. Republicans won 100 of 110 seats in the 1943 state legislature.

M. Q. SHARPE, elected governor of South Dakota Nov. 3, 1942, on the Republican ticket

Education.—The school census for 1942 was 176,959; the average actual attendance was 133,446.

Communication.—On Jan. 1, 1939 there were 5,851 mi. of rural state highways, of which 4,932 mi. were surfaced. In 1939 there were 4,127 mi. of steam railways in the state.

Finance.—Total receipts for the fiscal year 1941–42 were $43,731,732; expenditures were $49,535,705; the balance in the state treasury on June 30, 1942 was $12,706,384. The state debt on that date was $32,056,000.

Agriculture.—In 1942 South Dakota had one of its most successful crop seasons. High production and increasing prices brought the value of crops to $224,000,000, an increase of more than 70% over the value for 1941. South Dakota ranked ninth among the states in corn, eighth in all wheat, second in durum wheat, third in other spring wheat, second in barley and rye, third in flax and second in wild hay.

Principal Agricultural Products of South Dakota, 1942 and 1941

Crop	1942 (est.)	1941	Crop	1942 (est.)	1941
Corn, bu	100,706,000	50,006,000	Wheat, bu.	46,403,000	35,130,000
Oats, bu.	89,360,000	54,912,000	Hay, tons	2,963,000	2,090,000
Barley, bu	62,559,000	38,610,000			

Manufacturing.—Manufacturing in 1942 continued to gain on a small scale, as did the production of dairy products. Farm-to-town migration ceased almost entirely, but the state suffered a severe loss in population through the movement of workers to out-of-state defense areas.

Mineral Production.—Production of minerals was drastically curtailed because of the federal order closing the gold mines. About 95% of the state's value of mineral production ordinarily comes from gold; other products are stone, sand and gravel, and raw clay. (L. K. F.)

Southern California, University of. An institution of higher education at Los Angeles, Calif., founded in 1880 by the Methodist church. With the coming of war the university offered its facilities to the government. The scientific-research cruiser "Valero III," formerly owned by Allan Hancock, was taken over. A strong N.R.O.T.C. was established, with Captain Reed M. Fawell, U.S.N. (Ret.) in charge. An accelerated collegiate program was inaugurated in 1942, and activities were geared to the war effort. A comprehensive physical fitness program was under direction of William Ralph La Porte.

Certain major divisions (engineering, medicine, dentistry, chemistry, physics) were filled to overflowing—others suffered decimation. Among innovations were occupational therapy, hospital training, many aviation courses, food technology, industrial hygiene and plant sanitation. More than 3,000 persons attend night and daytime courses in engineering. The commission on postwar reconstruction, headed by J. Eugene Harley, did notable work.

The president of the university is Rufus B. von KleinSmid. For statistics of faculty, student enrolment, etc., *see* UNIVERSITIES AND COLLEGES. (R. D. HU.)

Soybeans.

One of the crops taking a major role in the 1942 U.S. wartime food effort was soybeans, which were known chiefly as a minor forage crop a decade previous and were so unimportant as a source of vegetable oil during World War I that gathering of production data was not warranted. The important use of soybean oil in 1942, however, resulted in the year's crop being almost double that of 1941 and about six times the ten-year (1930–39) average production. The U.S. 1942 crop was estimated Nov. 1 as 209,953,000 bu. compared to 106,712,000 bu. in 1941 and a ten-year average of 35,506,000 bu. Owing to the widespread use of soybean oil as a cooking fat and in butter substitutes, and also as a source of glycerin for munitions manufacture, the department of agriculture in Sept. 1941, asked that the acreage planted to soybeans in 1942 be increased to 7,000,000 ac. Following the attack on Pearl Harbor this goal was raised to 9,000,000 ac. The acreage harvested for beans in 1941 was 5,855,000 ac. About 77 per cent of the crop was crushed for oil, yielding approximately 736,000,000 lb. of oil. In Sept. 1942, the Commodity Credit Corporation announced a program to aid in the processing of vegetable oils, assuring, with allowances for types, grades, location and season, that the price to farmers would be about $1.55 per bu. This price was based on an assurance of $1.60 per bu. for high oil-content varieties. While for the preceding six or seven years the use of soybean oil in cooking fats and butter substitutes had increased enormously in the United States, the war gave extra impetus to further use in 1942, since the large shipments of coconut oil and copra from the Philippines and other tropical countries were no longer available. The record 1942 crop exceeded the crusher capacity, and the government urged that mills which ordinarily crushed copra, flaxseed and cottonseed be utilized to crush soybeans. It was estimated that about 1,125,000,000 lb. of oil would be crushed from the 1942 crop. (*See* also CHEMURGY.)

U.S. Soybean Production by Leading States, 1942 and 1941

	1942 bu.	1941 bu.		1942 bu.	1941 bu.
Illinois	73,487,000	54,112,000	Ohio	27,761,000	12,800,000
Iowa	40,340,000	17,501,000	Missouri	8,100,000	1,824,000
Indiana	31,605,000	15,436,000	North Carolina	3,848,000	2,185,000

(S.O.R.)

Spaatz, Carl A.

(1891–), U.S. army air officer, was born June 28 in Boyertown, Pa. He was graduated from West Point in 1914, studied at the aviation school in San Diego in 1915 and participated in the Mexican campaign a year later. During World War I, he commanded a pursuit squadron in the St. Mihiel offensive in 1918 and was decorated for shooting down two enemy planes. After the war he was stationed at various U.S. flying fields, and in 1929 he piloted th army plane that established a record of 150 hr. and 40 min. i an endurance flight over Los Angeles. Advancing rapidly in th air corps, he was chief of staff to Gen. Henry H. Arnold in 1941 and soon after Pearl Harbor he took over the air force comba command, replacing Gen. Delos C. Emmons. In July 1942 h was named U.S. air commander in Europe. On Dec. 5 it wa announced in London that Maj. Gen. Spaatz had been assigne to reorganize Allied air power in Africa.

Spain.

A totalitarian state of southwestern Europe, occupying 84% of the Iberian peninsula. Area (including th Balearic and Canary Is.): 194,200 sq.mi. Pop. (1940): 25,878,000; in 1930 it was 23,563,687. Capital city: Madrid (1,194,756). Other leading cities: (pop. est. 1940): Barcelona (1,398,900); Válencia (403,100); Sevilla (253,200); Malaga (232,130) Language: Spanish. State religion: Roman Catholic. Chief o state, or caudillo in 1942 (since 1939): Gen. Francisco Franc

History.—Spain during 1942 still managed to maintain a precarious balance on the tight-rope of neutrality. The historica background of her civil war included a heavy indebtedness t Germany and Italy by the Franco administration, also an enmit to the U.S.S.R. The ideology of the dominant party, the Falang Española, was fascist. The location of the axis powers als made it impossible for Spain to disregard their military strength Most of the public statements of Gen. Franco throughout th year were pro-axis, a trend likewise exemplified by such items a a severance of relations with Poland in January, an announcement that repayment was starting on the Italian debt ($260,000,000 at old rates of exchange), and the incorporation of th volunteer "Blue Legion" fighting with the Germans in Russi into the regular Spanish army. Spain could not disregard th allies, however, being vulnerable to attack in the northwes and southwest, and in addition being dependent upon the good will of the United States and Great Britain for some types o vital supplies. Most important of all was the fact that Spai had not yet recovered from the devastating effects of the civi war (1936–39); thus it was neither politic nor desirable for th country to enter World War II on either side. The invasio of North Africa by the allies in November intensified her problem, for Germany took over unoccupied France and massed a army along the Pyrenees while the allies threatened a possibl invasion of the continent by way of Spain. In the emergenc the government announced that it would resist an invasion o Spanish soil by any power, partially mobilized the army, increased defense appropriations, and prepared to ride out th storm if possible as a non-belligerent.

Relations between the United States and Spain remained officially friendly through the year. In June a new American ambassador, the Catholic historian Carlton J. Hayes, took up his dutie in Madrid. Pres. Roosevelt in September proposed the raising o a fund in the Americas for the restoration of historic and ar treasures damaged in Spain during the civil war, and while thi was in part designed to combat propaganda in Hispanic America it also indicated a willingness toward friendship with Spain itsel The United States continued to purchase mercury, wolfram an olives, and to supply Spain with foodstuffs and a limited quantit of gasoline and fuel oils.

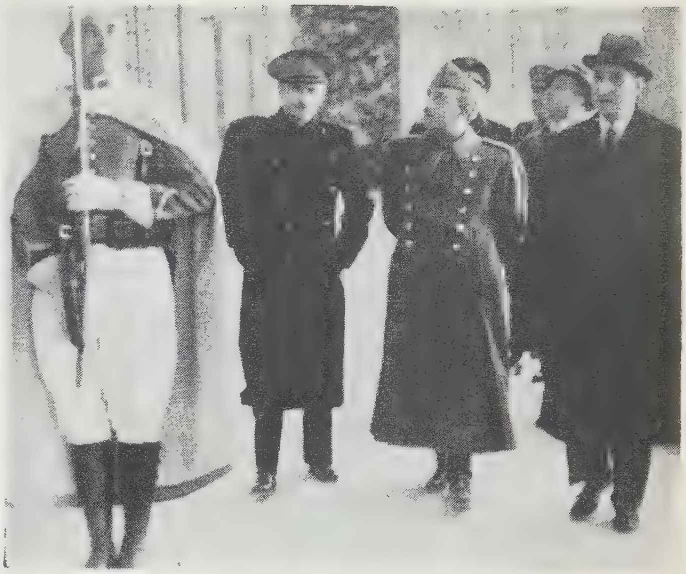
The inauguration of a new type of Cortes or parliament wa announced in July. Its membership, partly nominated and partl elected, represented various corporative bodies, including th Falange, the national council of provincial mayors, the arm and presidents of academies. A more widely discussed eve in Spanish internal politics, however, was the cabinet shakeu of Sept. 3, in which Ramón Serrano Suñer, brother-in-law ranco and generally considered second to him in the adminis- ation, was removed both as foreign minister and as president f the Falange. Several other changes were made; Gen. Franco imself took over the presidency of the Falange, and Gen. rancisco Gómez Jordana, lukewarm to the axis and a monarchist, ecame foreign minister. Apparently the change was due in part a dispute between the Falange and Spanish army leaders, ually monarchists. Suñer had been making appointments of rty men to military posts, and resentment had also been oused when in August party terrorists threw hand grenades to a religious festival being addressed by army officers includ- g Gen. José Enrique Varela, minister of war. Some observers edicted a change in policy since Suñer had been an ardent axis pporter, but this did not follow; in Spain itself the move as called a mere "changing of the guard." Suñer was reap- inted to the Falange council in November. The Spanish onarchist movement, in spite of some reports of activity, seems have marked time through 1942, probably because of the oubled world situation. In November it was stated that the ermans had arrested in southern France and turned over to anish authorities Francisco Largo Caballero and Santiago sares Quiroga, noted former Republican leaders, but news ms in December asserted that these men had been seen in vitzerland.

In the economic field, Spain was still suffering from the devas- ion of the civil war and was devoting all efforts toward construction. A million Loyalists were still in concentration mps or labour battalions, and four-fifths of the Spanish popu- ion suffered from malnutrition in varying degree. Transporta- n was still inadequate. Railway rolling stock was below the 36 level, and was reported to be in very bad repair. Electrifica- n of all rail lines was proposed because of a coal shortage. ck of motor fuels prevented great development of highway nsportation, and as a result distribution of what food supplies re available was inefficient. The problem was further com- cated by hoarding and speculation, and a black market de- loped, the fines on which alone amounted to more than 00,000 pesetas by summer. Bad weather in many sections ther reduced the food supply for 1942. Efforts were made by government to improve transportation by an extensive ship- ilding program, and the Instituto Naciónal de Industrias was en control of all shipyards and construction. Forced labour ttalions were also used to develop both irrigation and housing ojects, and much encouragement was given to plans for chemical d mineral production to supply needs.

Education.—The system in 1942 was nominally compulsory d free; religious education was handled as in the days of the narchy.

Defense.—In the partial mobilization ordered in Nov. 1942 Spanish army was estimated to number 750,000; approxi- tely 100,000 were in Spanish Morocco. The navy in 1942 s made up of 1 heavy cruiser, 5 light cruisers, 18 destroyers, orpedo boats, 9 submarines, all fairly modern. In the 1942 dget approximately 1,970,048,600 pesetas was alloted to de- se; later it was increased by credits of 324,362,053 pesetas h a naval building program in view.

Finance.—The official monetary unit is the peso (value in 42: 9.13 cents U.S.). The currency in 1942 was artificially ntrolled, with no metallic reserves for paper. The budget nounced for 1942 was 7,880,194,669 pesetas, an increase of % over that of 1941. Estimates were higher for all services ept public debt, foreign affairs and public works. The mora- ium on commercial and other types of indebtedness was to lifted Jan. 1, 1943, according to official announcement. In rch the government formally repudiated all republican debts.



A PORTUGUESE-SPANISH CONFERENCE was staged at Seville Feb. 12, 1942. Left to right are Ramón Serrano Suñer, then Spanish foreign minister, Francisco Franco and Oliveira Salazar, premier of Portugal

Trade and Communication.—Late Spanish trade figures were not available in 1942 (for 1940 exports were valued at $128,839,000; imports: $202,745,000). Total shipment of green olives to the U.S. for Jan.-Oct. 1942 was 4,255,581 gal. (1941: 4,700,764 gal.); total export of sweet oranges for the 1942–43 season was estimated at 500,000 metric tons (60% to Germany). A Spanish goods-exchange agreement with Switzerland was signed in June, and one with Germany in December; an agreement with Denmark for exchange of Spanish cork and fruits for Danish manufactures was extended six months from August, at a 50% increase. Shipping to the Canary Islands was reported as disrupted; trade taxes there were doubled.

Communication systems in Spain continued in bad shape. In railway rolling stock, there were 325 fewer locomotives (9%) and 1,500 fewer passenger cars (30%) than in 1936; the number of freight cars was almost back to the 1936 level (98,570 cars). Quality and repair of equipment were reported poor. One new electrified line was reported for the Bilbao district. All possible freight was carried by water; the merchant fleet was estimated at 1,056,875 tons, with ships under construction valued unofficially at $46,745,000. Five hundred small vessels were said to be nearing completion at Valencia for the Mediterranean trade. Automobile driving was limited by lack of fuel; private cars could not operate in Spanish Morocco, and only for limited periods in Spain and in the islands.

Agriculture.—Crops were in general reduced in 1942 because of bad weather, lack of fertilizer, etc. The green olive crop suitable for export was: 240,000 gal. queen olives (total crop est. 640,000 gal.), 800,000 gal. manzanilla olives (total crop est. 2,400,000 gal.) (1941 crop suitable for export: 11,200,000 gal. queen and 8,000,000 gal. manzanilla). Estimates for other crops were as follows: edible olive oil, 1942–43 season, 275,000 metric tons (320,000 m. tons in 1941–42); dried broad beans: 705,300 metric quintals (703,840 quin. in 1941); sweet oranges, 1942–43 season: 500,000 m. tons (the crop in 1939 was 900,000 m. tons); cotton: 4,000,000 kilograms; potatoes: 62,000,000 metric quintals; paprika, 1942–43 season 3,000,000 to 3,500,000 kgms. (at least 1,000,000 less than for 1941–42); cereals 1,962,000 metric quintals; sugar beets, 1942–43 season: 2,300,000 tons. The almond and filbert crops were prohibited from export, except for bitter almonds; they amounted to: almonds 25,000 tons shelled; filberts 9,000 tons shelled.

Mineral Production.—No figures for 1942 were available. Estimates on some items, for the first 8 months of 1941, were as follows (in metric tons): lead 18,991; zinc 48,527; copper 242,555; manganese 6,305; iron 1,080,000. Mercury was being produced at that time at the rate of 7,000 flasks per month, tungsten, 50 tons per month, potash, 100 tons daily. (*See* also WORLD WAR II.)

(D. RD.)

Spangler, Harrison E. (1879–), U.S. lawyer and politician, was born June 10 in Guthrie county, Iowa. He was graduated from Iowa university law college and was admitted to the bar in 1905. Active in Republican party activities since his youth, Spangler worked his way up to state leadership and in 1931 became a member of the Republican national committee. He directed Alfred Landon's presidential campaign for the midwest area in 1936. After the retirement of Joseph W. Martin as chairman of the Republican national committee in 1942, Spangler was listed as a nominee for the post, along with Werner Schroeder and Frederick Baker at the G.O.P. convention in St. Louis, Dec. 7. After two ballots revealed a deadlock between Schroeder and Baker, the Republican committeemen came to a compromise and selected Spangler.

Spanish-American Literature. The novels published in Spanish America in 1942 were numerous and in some cases very good. The ever interesting and vital group of young Ecuadorian writers contributed two notable works: one, the novel *Nuestro pan* (translated into English under the title *Our Bread*), by Enrique Gil Gilbert, is a social drama centred around rice; the other, *Sanagüin*, by G. Humberto Mata, describes the daily life of the Cuenca province Indians. Porfirio Díaz Machicao of Bolivia was author of a first novel, *Vocero*, published in Buenos Aires, describing the tragic life of a newspaperman in the corrupt political setup of his homeland.

In Mexico, the distinguished writer Ermilo Abreu Gómez in *Héroes mayas* strove towards pure creation and away from simply objective narrative, although at the same time he did not lose contact with the native earth. Agustín Yañez, in his *Flor de juegos antiguos*, described the childhood and adolescence of a provincial boy in a provincial town. Other Mexican novels of the year were *Ciudad* by José María Benítez, the 1941 Lanz Duret prize of El Universal, but generally considered a second-rate novel; *Los embozados* by Eduardo Luquin; *Los bragados* by J. Guadalupe de Anda; and *Una vez fuí rico* by Rubén Romero, the famous author of *Mi caballo, mi perro y mi rifle*.

Of the regionalist type of writing, we find in 1942 novels such as *El tigre* by the Guatemalan Flavio Herrera, in a quick, nervous style; *Uno de los de Venancio* by the Venezuelan Alejandro García Maldonado, based on the life of a 19th century "caudillo"; *Renacimiento* by Haim López-Penha, first prize of the 1940 unpublished Dominican novel contest.

Chile, besides its usual crop of "costumbrista" novels such as Waldo Urzúa's *Un hombre y un río*, Raúl González Labbé's *Chépica* and Juan Modesto Castro's *Froilán Urrutia*, saw printed in 1942 some interesting psychological works such as *Daniel* by Benjamín Subercaseaux, *Noche* by Eugenio González, the novel of an introspective small town professor, and *Las cenizas* by Mari Yan.

In Argentina, although published late in 1941 *Todo verdor perecerá* by Eduardo Mallea may be considered a 1942 book, important in the development of the style of one of the most interesting writers of the River Plate; the same may be said of his book of essays *El sayal y la púrpura* for the development of his wavering ideology. Silverio Boj's *Áspero intermedio*, Sergio D. Provenzano's *El color de la tierra*, and Andrés Requena's *Los enemigos de la tierra* are appreciable works. In a book devoted in part to a novel *Banco inglés* and in part to short stories, we become acquainted with a new and capable Argentinean writer, Isidoro Sagüés.

Besides Sagüés' sea stories, most of the short-story books of Spanish America in 1942 were devoted to the rural or folklore tale: *Tierra embrujada*, by the Colombian José Antonio León Rey, full of traditional and legendary material from Cundinamarca; *Rastrojos*, by Samuel Barreto Peña, on Venezuelan customs; *Kayou*, stories from Haiti by the Colombian José Enrique Gaviria; *Estampas de Rapel* by Rafael Fernández Rodríguez, with stories from Colchagua, Chile. Another Chilean, Luis Merino Reyes, published *Los egoistas*, six city stories linked by the fundamental egotism of the main characters of the different tales. Januario Espinosa, also from Chile, published *La ciudad encantada* and Teófilo Cid in his *Boulroud* represents Chilean surrealism in the short-story.

In the field of the essay, Alfonso Reyes published a delightful piece *Los siete sobre Deva* (*Sueño de una tarde de Agosto*). Reyes also published *La antigua retórica*, an example of his classical erudition. In Argentina, Victoria Ocampo wrote a second series of *Testimonios* (most of them previously published in her review *Sur*). Ricardo Rojas published *Archipiélago*, an epic of the Tierra del Fuego. Helvio I. Botana's *Los pervertidores* and Dardo Cúneo's *Esquemas americanos* should be mentioned. A Cuban, Virgilio Ferrer Gutiérrez, in an excellent book *Caribe*, projected his Cuban spirit outside his native island and over the neighbouring countries; another Cuban, Rómulo Lachatañeré, in his *Manual de Santería* studied different aspects of the Afro-Cuban lore. The Mexican Justino Fernández published a study of the painter *José Clemente Orozco, Formas e idea.*

Of both literary and historical interest are the following works published in 1942: *Fray Bartolomé de las Casas, el conquistador conquistado*, by the Mexican Agustín Yañez; *Ventura de Pedro de Valdivia* by the Chilean Jaime Eyzaguirre; a *Simón Bolívar* by an Argentinean, Telmo Manacorda; a *Vida de don Gabriel García Moreno*, the "strong man" of 19th century Ecuador, by the Argentinean novelist Manuel Gálvez; a considerable number of Martiniana by Cuban writers, Felix Lizaso's *Martí y la utopia de América*, Carlos Márquez's *Martí, maestro y apóstol*, Juan Marinello's *Españolidad literaria de José Martí.* On other Cuban glories, José E. Perdomo's *Máximo Gómez*, and Mañach, Marinello and Barreras' *Recordación de Alfonso Hernández Catá.* The Colombian Luis de Greiff published *Semblanzas y comentarios;* the Ecuadorian Father Reginaldo María Arizaga, *Valores ecuatorianos* (*escritores y poetas*); the Peruvian Luis Alberto Sánchez, a romanced biography of Gauguin's Franco-Peruvian grandmother, *Una mujer sola contra el mundo.* The same irrepressible Sánchez published in 1942 a volume of *Historia de América* and a third book *El pueblo en la revolución americana.*

Spanish-American poetry was enriched in 1942 by the publication of *Bajo el signo mortal* by the great Mexican poet *Enrique González Martínez.* The Uruguayan poetess Juana de Ibarbourou had an anthology of her work published under the title *Poemas.* Two young new Mexican poets appeared in print in 1942: Manuel Calívillo, with his *Estancia en la voz*, and Bernardo Casanueva Mazo with his *En la cuarta vigilia.* A Guatemalan, Raúl Leiva, also had a first book printed—*Angustia.* Alfredo Mosquera of Colombia had a book of verse printed under the title *Disparatorios.*

The Mexican theatre was favoured by two good works, *Linda*

Miguel N. Lira, a folk tragedy in prose, verse and music on e Federico García Lorca pattern; and *La mujer legítima*, an ex- llent piece by the poet Xavier Villaurrutia. (L. Mo.)

anish Colonial Empire.

Total area (approx.) 128,100 sq.mi.; total population ex- uding Spain (est. Dec. 31, 1939) 1,005,000. The table below ts the African colonies, protectorates, etc., of Spain (*q.v.*) with rtain essential statistics appropriate to each of them.

Spanish Colonial Empire

Colony and Area sq.mi. (approx.)	Population Estimated Dec. 31, 1939 (000's omitted)	Capital, Status, etc.	Principal Products (in metric tons)	Imports and Exports (in thousand pesetas)	Road, Rail and Shipping	Revenue and Expenditure (in thousand pesetas)
euta and Melilla, 77	115	Madrid, administered as part of Spain	exports (1934) raw materials 899,553, manufactures 12,892	(1934) imp. 47,546 exp. 14,500

anish Literature.

Though Spain's foremost writers produced little in 1942 (Baroja, with ee novels, and Azorín, with *Sintiendo a España*, were notable eptions), publication in all fields was brisker than in any year ce 1935. The St. John of the Cross quatercentenary evoked le but articles and lectures but P. Crisógono's *Vida*, and *Anto- ía* by J. Domínguez Berrueta and an *ensayo literario* (*San Juan la Cruz*) by M. Herrero García merit notice. Another cente- y is commemorated in N. Alonso Cortés' *Espronceda*. A. Val- ena Prat's *Calderón* is the work of a first-rank younger critic. ong the veterans, R. Menéndez Pidal published *La Lengua de stóbal Colón y otros estudios sobre el siglo XVI;* M. Asín acios collected several long critical studies in *Huellas del Islam;* l the octogenarian F. Rodríguez Marín completed a new collec- n of *refranes* and also issued a selection of his poems extending r 70 years in *A la Real de España*.

Biographies included L. Astrana Marín's *Vida inmortal de Wil- n Shakespeare;* Manuel Prados López's *Salvador Rueda;* and egorio Marañón's *Luis Vives: un español fuera de España.* story and biography mingle in J. M. March's *Niñez y juventud Felipe II* and in the Conde de Romanones' *Un Drama político: bel II y Olózaga*. Poetry was represented by G. Diego's *Alondra verdad* and *Primera Antología de sus versos* and Eduardo Mar- na's *Los Tres Libros de España;* it also figured largely in the *Cuadernos de literatura contemporánea* being published by Instituto Antonio de Nebrija.

Lopean criticism was stimulated by the projected Centro de udios Lope de Vega, which was to issue a Lopean review and tinue the publication of the *Obras completas*. The Spanish demy published Ricardo del Arco's *La sociedad española en obras dramáticas de Lope de Vega*. A. G. de Amezúa continued his *Epistolario de Lope de Vega*. J. de Entrambasaguas published some of Lope's little-known poems (*Flor nueva del "Fenix"*) and also *Los Embustes de Celauro*. A *Romancero espiritual*, edited by Luis Guarner, was an outstanding addition to Lopean bibliography.

Reprints of all kinds abounded. Five volumes of the new Menéndez Pelayo had now appeared and three volumes of F. C. Sainz de Robles' edition of Pérez Galdós. As to early texts, Dámaso Alonso published a three-volume edition of Gil Vicente's *Tragicomedia de Don Duardos*. Fernández de Oviedo's *Natural Historia de las Indias* was edited by E. Álvarez López. Two minor 19th-century texts reissued by A. González Palencia were Trueba y Cossío's *España romántica* and Hurtado's *Madrid dramático*.

An authoritative topographical work of the year was Antonio Gallego y Burín's *Granada: Alhambra y Generalife*. (E. A. P.)

Special Libraries Association.

Founded in 1909 to further the purpose of special libraries in business and industrial organizations, and to promote the collection, organization and dissemination of information in specialized fields; to develop usefulness and efficiency of special libraries and other research organizations; and to encourage the professional welfare of its members. As of Dec. 31, 1942, the association had 2,800 members in the United States, Canada and overseas. These members represent banking, advertising, insurance, finance, publishers, manufacturers, museums, specialized departments of colleges and universities, business branches of public libraries and technical libraries. The official journal, *Special Libraries,* is published monthly September to April, with bimonthly issues May to August. The association has 18 chapters in the United States and two in Canada. An annual convention is held each year in June The association carries on a publications program which is professional in character and is taking an active part in the war effort. *Special Library Resources,* vol. 1, was published in 1941 with three additional volumes planned for early 1943 publication.

The 1942–43 officers were: president, Eleanor S. Cavanaugh, Standard and Poor's corporation, New York city; first vice-president, Madge J. Collar, Sixth Service Command Library, U.S.

Army, Chicago; second vice-president, Walter Hausdorfer, School of Business, Columbia university, New York city; treasurer, Jean Norcross, Dun & Bradstreet, Inc., New York city; secretary and advertising manager, Kathleen B. Stebbins, 31 E. 10th St., New York city. Directors: Ford M. Pettit, the *Detroit News*, Detroit, Mich. (term expiring 1943); Herman H. Henkle, The Library of Congress, Washington, D.C. (term expiring 1944); Betty Joy Cole, Calco Chemical Division, American Cyanamid company, Bound Brook, N.J. (term expiring 1945); Laura A. Woodward, Maryland Casualty company, Baltimore, Md. (term expiring 1943). (K. B. S.)

Spelman Fund of New York was chartered in 1928. The fund, during 1942, continued its program directed at the improvement of the methods and techniques in the field of public administration. The Chairman of the Board of Trustees in 1942 was Charles E. Merriam. (C. Mh.)

Spender, John Alfred (1862–1942), British journalist and liberal, was born in Bath, England. He was editor of the *Westminster Gazette*, 1896–1922, and was a prolific writer of biography and history. Spender was made a Companion of Honour in 1937. His books include: *The Public Life* (1925), *The Changing East* (1926), *Life, Journalism and Politics* (1927), *Fifty Years of Europe* (1933), *These Times* and *A Short History of Our Times* (1934), *Great Britain, Empire and Commonwealth, 1886–1935* (1936), *The Government of Mankind* (1938) and *New Lamps and Ancient Lights* (1940). He died in Farnborough, Kent, June 21. (See *Encyclopædia Britannica.*)

Spices. Distribution became adjusted to government rules. The 1941 OPA ceiling on whole black pepper was lowered. Trading became desultory, restrictions making flat, colourless markets. The year 1942 closed with about 23,700 tons in public warehouses, sufficient black pepper for probably two years. Spice grinders held good "invisible" stocks.

Deliveries of black and white peppers, pimiento, cloves, ginger, cassia, cinnamon, nutmegs and mace were limited by the War Production board to percentages of the quantities bought in 1941. British West Indies were the only source of mace, nutmegs and pimiento.

In May, 1942, the general maximum price regulation of the Office of Price Administration froze prices at March, 1942, levels. This "roll-back" for many meant ceilings below replacement costs. OPA invited appeals for the adjustment of price anomalies.

East Indian nutmegs, mace and the rich-flavoured Batavia and Corintjie cassias were expected to disappear soon. The preferred Saigon cinnamon formerly shipped via Hongkong was almost gone. The Chinese areas from which Kwangsi, Taiwo and other cassias were obtained were in enemy hands. Some cinnamon trickled in from Ceylon.

Imports of East Indian peppers were not expected to be resumed for many years. In India (Malabar district) black pepper formerly was big business. Without Indonesian competition, cultivation of Tellicherry and Alleppy black peppers were expected to be revived.

U.S. farmers were alert. Their experiments with coriander, caraway and poppy seeds, also sage and paprika proved the suitability of U.S. soil, etc. for such spices. Pods for making the familiar ground red pepper in small tins are a regular crop in South Carolina, Louisiana and Mississippi. Mexican chili peppers (for chili con carne), despite lack of usual Japanese labour, was an important crop in California.

Large harvests of mustard seed in the northwest, with South Dakota a newcomer, were gathered in 1941–42. Enough yellow seed was accumulated to last well into 1944. There were no Government restrictions on sales of mustard. Adequate supplies of celery seed (formerly from France), fennel, cumin, white poppy, sesame seeds and turmeric were obtainable from India.

An OPA meeting in Washington discussed price ceilings for raw spices in original packages. Attendance represented about 90% of the industry. On September 25, 1942, the ceilings for 45 spices were published. With prices thus controlled, following limitation of deliveries (M-127-B), federal regulation was practically complete. WPB import licences were necessary for most spices.

Tin or black plate was unobtainable. Spices were expected to be sold in glass, plastic or paper board packages.

Statistics of imports were not released by the Department of Commerce.

The many tons of ground and packed spices required by the armed services of the U.S. constituted a large percentage of total output. (C. A. T.)

Spurgeon, Caroline Frances Eleanor (1869–1942), British educator and writer, was a student in Dresden, Paris and at King's college and University college, London, where she won many honours. A noted scholar of Chaucer and Shakespeare, she was one of the first women professors at the University of London, 1913–29. During the same period, she was head of the English literature department at Bedford College for Women in London. She was a founder and first president of the International Federation of University Women. From 1920 to 1921, Dr. Spurgeon was visiting professor at Columbia university. In 1937, she went to live in Tucson, Ariz., where she died Oct. 24, 1942.

Squash Racquets. Charles W. Brinton, Princeton senior, won his second straight national squash racquets championship with his conquest of the 1942 field at Buffalo. He defeated Harold Kaese, Boston sports writer, in the final, three games to two. Brinton also retained his national intercollegiate championship. Lieut. Hunter Lott, Jr., and William E. Slack of Philadelphia won their fifth straight doubles title in the 34th annual championship. G. Fred Rogers of Buffalo dethroned Joe Janotta of Chicago as National Veterans' champion.

The United States easily captured the Lapham trophy against Canada. Boston won the Lockett trophy, and Detroit won the national amateur team championship of squash racquets. Lester Cummings of New York continued his reign as national professional champion, while Miffin Large and Donald Strachan of Philadelphia won the pro doubles.

Squash racquets and its two sister indoor sports, racquets and squash tennis, were hard hit by the rubber shortage. Squash racquets play subsided after the nationals in February, and the

1943 tournament, originally awarded to Detroit, was called off. No squash balls were available during most of 1942, although seamless missiles, made from repossessed rubber, were expected to be used in 1943.

H. Robert Reeve of the Bayside Tennis club, N.Y., won the national amateur squash tennis championship, defeating Joseph J. Lordi of the New York A.C. in the final. Lordi was the defending champion. Reeve, who entered the Navy as an ensign after winning the title, was the first player to top the squash tennis rankings since 1930, when Harry F. Wolf started his long reign. Robert Grant III captured the national championship in racquets. (M. P. W.)

Stainforth, G. H. (1899?–1942), British air ace, was a member of the Schneider Cup Trophy team which set a world speed record of 408.8 mi. an hour in Sept. 1931. A member of the R.A.F. after 1923, he aided the development of the modern British fighter planes by his skill and daring in test flights. In World War II, he saw action on the middle east front as wing commander, and lost his life while on night fighter duty, according to a Cairo report of Sept. 30.

Stainless Steels: *see* METALLURGY.

Stalin, Joseph Vissarionovich (1879–), Russian statesman, was born in Georgia and succeeded Lenin as virtual dictator of the Soviet Union in 1924 (see *Encyclopædia Britannica*). On May 6, 1941 Stalin assumed the premiership of the U.S.S.R. after the resignation of Vyacheslav Molotov from that office. After the German invasion began June 22, 1941, Stalin, emerging from his accustomed seclusion of former years, made a number of public appearances and addresses. On July 3, 1941, in one of his rare radio addresses, he exhorted his people to "know no fear," to scorch the earth before the German advance. On July 19, 1941, he took over the post of defense commissar. On Oct. 19, he called upon all Muscovites for a last-ditch fight to save the capital.

On April 30, 1942, he assured smaller European powers that the U.S.S.R. had no territorial ambitions other than to liberate its lands from the nazis. On Aug. 12, he conferred with Churchill in the Kremlin and on Sept. 23 he received Wendell Willkie. Although he declared on Oct. 3 that Allied aid was not commensurate with Russia's contribution in holding the nazis at bay, he expressed confidence on Nov. 6 that the Allies would open a second front "sooner or later." Two days later, U.S. forces landed in Morocco and Algeria; on Nov. 13 Stalin said these operations had opened the way for an early axis collapse. (*See* also UNION OF SOVIET SOCIALIST REPUBLICS.)

Stalingrad. (formerly Tsaritsyn), a town of the U.S.S.R., is the administrative centre of Stalingrad province, which occupies 1,354,000 sq.km. with a population of 2,289,000, of which (census 1939) 1,396,000 lived in rural districts and 893,000 in towns. It is the most important town on the right bank of the most western salient of the Volga river and is 1077 km. from Moscow.

During the civil war Stalingrad was the arena for fierce fighting between the Red and White armies, and Stalingrad province suffered very much from the famine of 1921. As a consequence of all this destruction, it took ten years to restore the town and province to its former economic significance. But from 1928 there began a rapid process of the building of many large factories in Stalingrad. It became one of the most important industrial towns on the Volga. Its population rose from 151,490 in 1926 to 445,476 in 1939, and it ranked as the 13th most populous town in the U.S.S.R.

On the eve of World War II there were working in Stalingrad two very large power stations which together possessed a productive capacity of 200,000 kw., a lorry factory with a yearly productive capacity of 100,000 lorries, a tractor factory with a yearly production of 40,000 caterpillar tractors, large factories producing quality steel, a large oil refinery, war factories, chemical industries, important textile industries (*e.g.*, a cotton factory with 100,000 spindles, a knitted fabric factory with 5,000 tons yearly productive capacity), food industries, etc., as well as a dockyard for river barges.

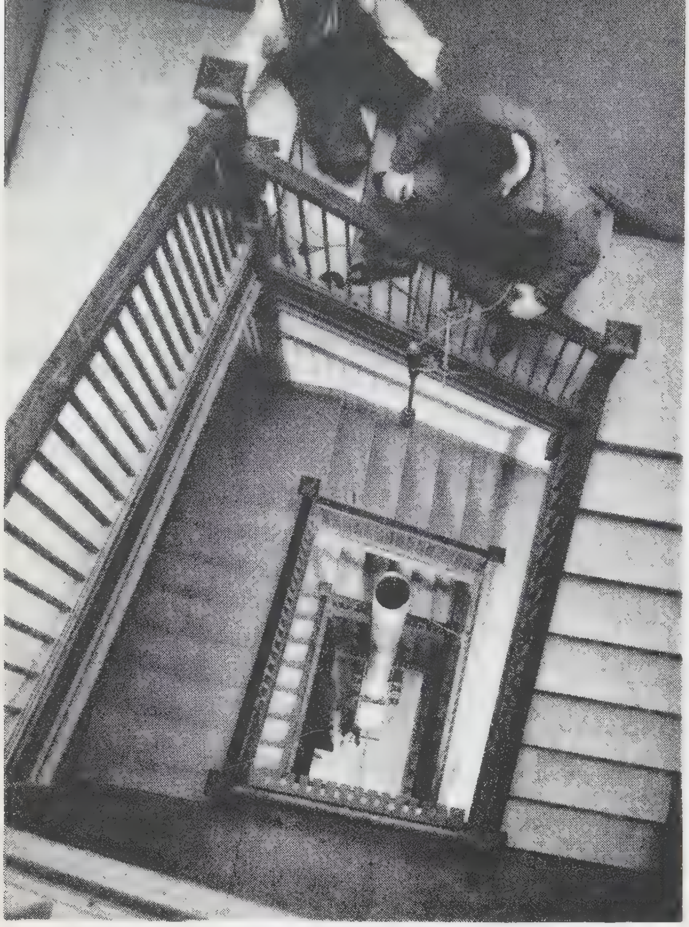
Stalingrad is also the largest cultural and educational centre of the low Volga, with a university, many technical and high schools, central hospitals for the whole of Stalingrad province, etc.

On Aug. 23, 1942, the Germans launched a direct attack against Stalingrad. In their first large-scale attack they used over 1,000 planes, hoping to force Stalingrad to surrender. The Germans continued to press the attack on a scale unprecedented in history, using between 700 and 800 planes daily, and up to 22 divisions with over 500 tanks, 1,000 mortars and 1,200 guns. But the Russians stood firm, at the beginning of November began to counterattack, and by the end of the month were on the offensive. By the end of the year the Russian offensive had made important progress (*see* WORLD WAR II). Only the military skill, endurance and heroism of every defender of Stalingrad could explain the successful defense of this city which presents no natural military obstacles to the attacker, stretching as it does for miles in a narrow strip along the Volga, close to the shore. (A. M. Bv.)

Stamp Collecting: *see* PHILATELY.

Standards, National Bureau of. The national bureau of standards of the department of commerce was established by act of congress March 3, 1901. Its functions are the development, construction, custody, and maintenance of the reference and working standards used in science, engineering, industry, and commerce. The bureau's services are available to the national and state governments and under certain conditions to private firms and individuals. It acts as one of the principal testing laboratories of the federal government in connection with the purchasing of supplies (other than food, drugs and certain military equipment), and conducts research in co-operation with governmental agencies and with engineering societies and trade associations.

TESTING WEATHER RESISTANCE OF PORCELAIN ENAMEL at the laboratory of the National Bureau of Standards in Washington, D.C. Enamelled metal was being used on roofs and walls of buildings in 1942 in place of more critical materials



THE BUREAU OF STANDARDS developed a method for determining the resistance of plastic aircraft window materials to impact. A soft-headed dart, released from an electromagnet mechanism, is dropped onto the test specimen through a long tube, from heights up to 65 feet

The bureau is made up of nine scientific and technical divisions, three divisions dealing with commercial standardization, and a special group set up as a war measure, and concerned wholly with military problems. The regular divisions are the following: electricity, weights and measures, heat and power, optics, chemistry, mechanics and sound, organic and fibrous materials, metallurgy, clay and silicate products, simplified practice, trade standards and codes and specifications. Each division consists of from four to ten sections which are the working units covering specialized fields.

On June 30, 1942, the bureau staff consisted of 1,780 employees and 52 research associates. The regular appropriation for the fiscal year was $2,968,000. In addition, $398,941 was made available in deficiency items. Of this total, $230,000 was for the construction of a new station for broadcasting standard frequency radio signals, $600,000 for building and equipping a new materials testing laboratory, and $280,000 for constructing a service building and for adding a second story to the main radio laboratory.

During 1942 it was necessary to shift a steadily increasing percentage of the scientific and technical personnel and laboratory equipment from peacetime to war activities. A great variety of problems requiring the special facilities of almost every section of the bureau, from textiles to atomic physics, were submitted by governmental agencies engaged in the war effort. The navy department in particular sent many problems to the bureau, and that some of these at least have been handled successfully is attested by the award to the bureau of the navy's "E" pennant for excellence in production.

The necessity of finding substitutes for critical materials gave rise to research along many diverse lines. Synthetic rubber, textiles and plastics were studied intensively.

In this connection it seems worth while to point out that ever since its establishment the bureau recognized the importance of fundamental research and advocated its more liberal support. The soundness of this argument was strikingly illustrated in the case of rubber. Painstaking measurements over a period of many years on the constants and properties of rubber and more recently on the rubber substitutes resulted in the accumulation at the bureau of a great deal of basic information on these complex hydrocarbons. This information was of the greatest value. Precise measurements made on isoprene when it was a laboratory curiosity were being put to practical use in the making of synthetic rubber in 1942.

The increased volume of research work was accompanied by an equally heavy demand for the testing of supplies for the government and of weights and measures, precision instruments and other apparatus for the public. The fee value of the bureau's test work showed the unusual increase of 33% over 1941. More than 18,000,000 bbl. of portland cement were tested for federal construction projects at the bureau's six strategically located branch laboratories. Approximately 16,000 precision gauge blocks were compared with the bureau's standards to determine whether or not they were sufficiently accurate as master length controls in the manufacture of aeroplanes, tanks, automotive equipment, guns and ammunition. The bureau's commercial standardization group co-operated with the War Production board in eliminating unnecessary varieties of types and sizes of articles offered for civilian consumption, in the development of commercial standards, and in the drafting of emergency alternate specifications covering substitutes for strategic materials. A valuable service to manufacturers was rendered by the bureau in keeping them informed of changes in specifications affecting their products. The bureau likewise took the lead in the preparation of safety codes for protecting federal buildings against air raids and saboteurs.

(L. J. Br.)

Stanford University (The Leland Stanford Junior University), an institution of higher education near Palo Alto, Calif. As the 4-quarter system had been in effect since 1927, the university was readily geared for the accelerated program of the war. Increased emphasis was given to the Reserve Officers Training corps, physical fitness programs, and to work in engineering, medicine and other sciences immediately important in war. Special courses were introduced in radio, physiotherapy, nutrition, nautical astronomy, marine navigation and secretarial training. Approximately 5,000 persons were instructed, under the engineering, science and management war training program, in ultra-high-frequency radio techniques for the army signal corps, the navy and for industry. Appropriate instruction was given to 707 students enlisted in army and navy reserves (air corps, medical, V-1 and V-7). A quartermaster corps unit was established by the war department under the Graduate School of Business.

Largely supported by a grant of $47,500 from the Rockefeller foundation, a School of Humanities was set up to include the following departments and divisions: classics, English, Germanic languages, graphic art, history, music, philosophy, religion, Romanic languages, Slavic languages, speech and drama. Instruction was extended in Chinese, Japanese, Russian, Serbo-Croatian, German (military), French, Spanish and Portuguese. Cultural subjects were emphasized as of vital significance in war and peace.

For statistics of enrolment, faculty, endowment, library volumes, etc., *see* Universities and Colleges. Chancellor: Ray Lyman Wilbur.

(R. L. W.)

Stark, Harold Raynsford (1880–), U.S. naval officer, was born at Wilkes-Barre, Pa., on Nov. 12. Graduated from the U.S. Naval academy in 1903, he was commissioned ensign two years later and served on various ships and at various naval stations from 1903 to 1917. During World War I he was on the staff of Admiral William S. Sims, commander of the U.S. naval forces in European waters. On March 15, 1939, he was appointed chief of naval operations with the rank of admiral. After this appointment he was persistent in his pleas for a larger U.S. fleet and appeared a number of times before congressional committees to urge, usually with success, larger appropriations. In the spring of 1941 he announced his support of the lend-lease bill and of U.S. convoys in the Atlantic.

The functions of his office were altered when Adm. Ernest J. King was appointed commander in chief of the U.S. fleet, Dec. 20, 1941; King was made directly responsible to the president and the secretary of the navy rather than to the chief of naval operations. On March 9, 1942, King also took over the post of chief of naval operations, and Stark was made commander of U.S. naval forces operating in European waters.

Stauning, Thorvald (1873–1942), Danish politician, was born Oct. 26 in Copenhagen. A cigar sorter by profession, he rose through trade union ranks to a position of prominence in the Danish government. He entered parliament in 1906, became head of the Labour party in 1913 and was minister of state in the Zahle cabinet, 1916–20. When the Labourites came into power in 1924, Stauning agreed to form a cabinet and held office until 1926. He formed a second government in 1929 and remained in power until his death. Stauning's protest over the occupation of Iceland in July 1941 by United States troops led many to believe that the Danish premier was pro-nazi in sympathy. Anti-Hitler circles in the United States denied this, however, declaring that the premier was a true patriot and democrat whose statement was probably made under duress. He died in Copenhagen May 3.

Stilwell, Joseph W. (1883–), U.S. army officer, was born March 19 at Palatka, Fla. He was graduated from West Point, 1904, and served with the A.E.F. n France during World War I. After the armistice, he studied Chinese at the University of California, spent three years at Peiping mastering several Chinese dialects and served as military attaché in China, 1932–39. After Pearl Harbor, he was promoted o lieutenant general, Feb. 1942. He served a month as General Chiang Kai-shek's chief of staff and in March 1942 Chiang gave him command of the 5th and 6th Chinese armies fighting the Japanese invading Burma. Unable to pronounce his name, the Chinese troops called him General Sze; his Yank units nicknamed him Uncle Joe. Beaten by numerically stronger and better-equipped Japanese, Stilwell retreated toward India. After the fall of Burma in May 1942, Stilwell led a group of 400 refugees through 140 mi. of jungles and mountains to safety in India; the trip took them 20 days. After turning up at allied headquarters in New Delhi, Stilwell said with surprising frankness: "I claim we got a hell of a beating. We got run out of Burma and it was humiliating as hell. I think we ought to find out what caused it, go back and retake it."

Stimson, Henry Lewis (1867–), U.S. statesman, of whom a biographical sketch appears in *Encyclopædia Britannica.* A Republican, he became an ardent admirer of Cordell Hull's policies as secretary of state (the office Stimson had held in Pres. Hoover's cabinet) and was always quick to defend Hull's actions against criticism. He favoured in particular a strong stand for the United States against Japan, Germany and Italy. Pres. Roosevelt appointed him secretary of war on June 20, 1940. Like his fellow cabinet-member, Frank Knox, Stimson favoured a militant foreign policy in 1940 and 1941. An advocate of a large army, Stimson revealed on Feb. 7, 1942, that a program for a 2,000,000-man air force was under way. On Oct. 14 he urged the senate to speed legislation permitting the draft of youths 18 and 19 years old and disclosed that the army planned to have a force of 7,500,000 men by 1943.

Stock, Frederick August (1872–1942), U.S. conductor and director of the Chicago Symphony orchestra for 37 years, was born Nov. 11 in Jülich, Germany. From his father, a bandmaster, he received his early musical training and later studied violin and composition at the Cologne conservatory. Theodore Thomas, founder and conductor of the Chicago Symphony orchestra, discovered Stock when he was a violinist with the Cologne orchestra and invited him to Chicago to join the new orchestra in 1895. He made his debut there as a viola player and six years later became Thomas' assistant and associate conductor. Shortly after the Chicago Symphony moved into its new quarters at the Orchestra Hall in 1905, Dr. Thomas died and Stock became his successor. He directed from the Orchestra Hall podium for the next 37 years, except for a short period during World War I, when public opinion forced his resignation until he could obtain his final U.S. citizenship papers. Dr. Stock was said to have introduced more scores by U.S. composers than any other conductor in the country. He composed three overtures, two symphonies, a violin concerto, a 'cello concerto, a *Festival March* and *Hymn to Liberty.* He died in Chicago, Oct. 20.

Stock Exchanges: *see* STOCKS AND BONDS.

Stocks and Bonds. **Stocks.**—Rarely had annual stock market price fluctuations, as well as the annual volume of transactions, been smaller than during 1942. Strange as it seemed, this unusual record occurred despite momentous developments of a domestic and international character. Neither war events, both favourable and unfavourable, nor extraordinary domestic news with respect to the dislocation of industry, the imposition of greatly increased taxes, and the introduction of rationing and other control systems, seemed to have any real effect, except momentarily, upon either the price level of stocks or bonds or the volume of transactions. Moreover, throughout 1942 the price level of stocks was extremely low, in view of corporate earnings and dividend distributions. For all of the leading groups of stocks, the price level sank gradually from January to May, and thereafter rose moderately from June to the end of the year.

Using the Standard & Poor's barometer figures (average for each month based on daily closing prices), the average monthly price of 20 representative railroad stocks stood at 28.1 for Jan., 1942, as compared with 24.9 and 29.8 for December and January of 1941. Thereafter a slight decline occurred until June, when the monthly average stood at 24.0. The steadiness of the market for railroad shares was indicated by the monthly averages of 28.0 for February, 26.2 for March, 24.8 for April, 24.6 for May, and 24.0 for June. For July the monthly average rose to 25.8, by August to 26.7, by September to 27.2, by October to 29.7, and for November 29.3. By way of summary, the monthly average dropped by 14% during the first half of 1942, and subsequently during the next five months rose by 22% over the June low of 24.0.

In the field of industrial stocks, using Standard & Poor's average for 50 leading issues, the average monthly price stood at 89.2 for January, as compared with 88.2 and 102.6 for December and January of 1941. Following Jan. 1942, the monthly average sank from 89.2 to 79.0 for May, or a decline of 11%. After May the average monthly price again rose gradually from 79.0 to 95.5 for November, an increase of 21%.

Similar price movements by months occurred in the public utility and copper and brass groups of stocks. For 20 public utility stocks the Jan. 1942 average stood at 35.4, as compared with 34.3 and 55.0 for December and January of 1941. Following Jan. 1942, the average monthly price declined from 35.4 to 28.8 in April, a decline of nearly 19%. Thereafter the price again rose from 28.8 to 35.4 for November, an increase of 19%. The Nov., 1942, average of 35.4, it should be noted, just equalled the 35.4 for Jan. 1942, but stood nearly 36% below the average price of 55.0 for January of 1941. The copper and brass stocks monthly average price stood at 80.9 in Oct. 1942, as compared with 88.3 for January, 70.8 for May, and 75.3 for September.

Combining all of the aforementioned groups of stocks (90 representative shares), the market showed a decline from 70.9 for January to 62.2 for April, or more than 12%. Subsequently the price rose to 75.3 for November, or an increase of 21%.

On Jan. 1, 1942, the market value of all listed shares on the New York Stock exchange stood at $35,785,946,533, with an average market price of $24.46. On Dec. 1, 1942, this market value stood at $37,374,462,460, with an average market price of $25.41. An appreciation in value of slightly over 4% was thus shown for the year. The aforementioned figures compared with a valuation of $40,280,000,000 for January, and $35,785,000,000 for December of 1941.

From the foregoing data it is evident that 1942 stock market price movements were reasonably steady and remarkably nonsensational. The decline during the early months of the year was substantially counterbalanced by the rise in the later months. The entire showing was rather unexpected in view of sensational war news, the tremendous enlargement of business activity along certain lines to meet huge war orders and the curtailment and disarrangement of businesses which did not fit into the war effort, and the tremendous earnings of the larger corporations with shares listed on U.S. exchanges. In fact, with respect to many of the listed issues of common shares, the dividend distribution to stockholders during 1942 equalled an 8% to 10% return on the prevailing market price, whereas the return on choice investment bonds remained extremely low.

Number, Volume and Amount of Stocks.—According to the New York Stock exchange's compilation, the total of stocks listed on that exchange on Dec. 1, 1942, stood at 1,470,976,125 shares, with a market value of $37,374,462,460. This value compared with $37,882,000,000 and $41,848,000,000 at the corresponding dates of 1941 and 1940, respectively. Of 1942's total, United States stocks aggregated 1,430,000,000 shares, valued at $36,614,000,000, and stocks of other countries 40,479,000 shares, valued at $759,796,000. The total of shares was distributed over 1,224 separate United States issues and 18 issues of other countries, representing a total of 836 issuing corporations.

Total shares traded on the New York Stock exchange during 1942 amounted to 125,677,963, as compared with 170,534,363 during 1941; 207,605,359 during 1940; 262,015,799 in 1939; 297,446,059 in 1938; and 1,124,991,000 in 1929, the largest total on record. The 1942 market, as was the case in 1941, was relatively stagnant. October was the largest month on the New York Stock exchange, with 15,932,595 shares, while May was the smallest, with only 7,229,097 shares. Up to Dec. 1, Nov. 9 was the largest day of the year with 1,207,643 shares, while July 1 was the smallest full day with a total of only 206,680 shares. The New York Curb market had sales during 1942 of 22,327,822 shares, as compared with 34,690,900 shares during 1941, and 43,041,774 shares during 1940. For other security exchanges of the country, data were not available at the time of this compilation, but the other United States exchanges are relatively unimportant as regards volume of transactions, in comparison with the New York Stock and the New York Curb exchanges.

Bonds.—Using the Standard & Poor's barometer figure for composite bonds (average for each month based on daily closing prices), the average high price stood at 100.3 for Jan. 1942 and 100.6 for February. Thereafter, for the rest of the year, the high average price varied between 102.9 for October and 99.22 for July. Moreover, the monthly fluctuation between high and low was very meagre. Only during January was there a range between high and low as great as 2.80 points.

The yearly price movement thus showed a remarkably stable bond market during 1942, and a comparatively high price level. The unsettled conditions prevailing in the stock market probably caused many to put their faith in presumably nonspeculative bonds. Again, the flotation of new bond issues almost reached the vanishing point, thus bringing to the fore a considerable pressure for in-

vestment by insurance companies and other large investment concerns. For the year 1942, according to the New York Stock exchange's record, bond and note flotations of U.S. corporations during the first 11 months of the year totalled only $876,256,000. But exclusive of refunding issues, investment trusts and holding companies the total flotation amounted to only $236,166,000.

Number, Volume and Amount of Bonds.—According to the New York Stock exchange's compilation, the total par value of bonds listed on that exchange at the beginning of Dec. 1942 stood at $67,155,675,692, with a market value of $64,543,971,299. These figures compared with $58,236,901,000 and $55,033,616,000 for Dec. 1941. The increase in the par value of bonds during 1942 was largely attributable to the issue of large amounts of new United States government securities. Of 1942's total, United States corporation bonds amounted to (beginning of December) $17,078,188,000 par value, with a market value of $13,389,451,000; company bonds of other countries with a par value of $864,116,000 and a market value of $714,931,000; United States government bonds (inclusive of corporations and subdivisions) with a par value of $47,010,151,000 and a market value of $49,153,422,000; and other governments (inclusive of subdivisions) with a par value of $2,203,221,000 and a market value of $1,286,167,000. The total listed bonds of United States corporations were distributed over 858 issues with 440 issuers; of United States government bonds with 79 issues and 5 issuers; and other governments with 159 issues and 53 issuers. Total bonds traded on the New York Stock exchange during 1942 amounted to $2,182,625,800, as compared with $2,114,098,550 during 1941, $1,671,598,875 during 1940, and $2,048,000,000 during 1939.

Stock Exchanges.—During 1942 the New York Stock exchange made a considerable number of important changes in its rules and practices. The most important changes may be grouped under the following five headings:

Changes with Respect to Exchange Practices.—Reference under this heading should be made to the following six actions of the exchange:

(1) On Jan. 29, 1942, effective Feb. 16, the board of governors of the exchange adopted a "special offerings" plan, providing for "the marketing on the floor of the exchange, by announcement on the ticker tape and by payment of a special commission, of blocks of listed securities which could not readily be absorbed in the auction market within a reasonable time and at a reasonable price." By December the exchange reported the completion of 56 such special offerings for a total of 655,839 shares, with a value of $17,329,764, and with a "time elapsed period" ranging from a minimum of 15 minutes in most cases to a maximum period of 1 hour and 41 minutes. It also reported 11 uncompleted offerings with 59,333 shares sold, with a value of $2,848,972, and 25,786 shares unsold, with a value of $1,250,032.

(2) On July 30, the board of governors approved an amendment to the constitution of the exchange, permitting the board, at its discretion, to change the unit of trading in listed stocks. This action was approved by the membership of the exchange on Aug. 31. Twenty-eight stocks were selected to be traded in units of 10 shares, beginning Sept. 1. Sixteen inactive and high-priced stocks were also added to the list. The change was not expected to have any adverse effects upon odd-lot houses.

WEEKLY MILITARY DRILL was begun by members and employees of the New York Stock exchange in the fall of 1942

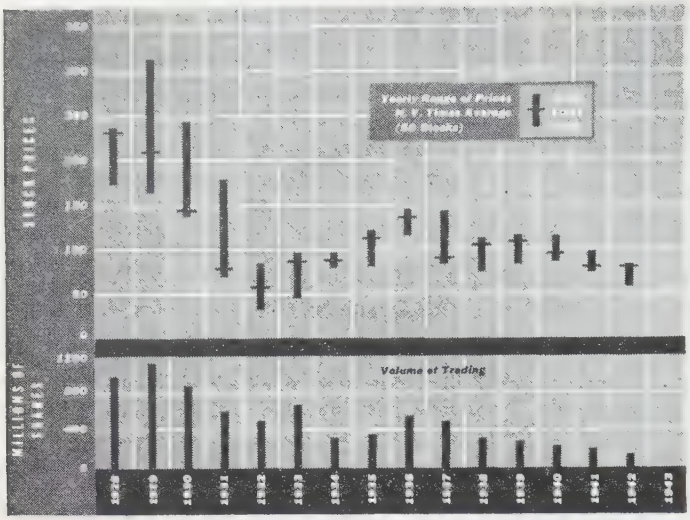
(3) For many years the Stock Clearing corporation conducted a "night branch" for the clearance of securities. On Sept. 1, 1942, this branch was discontinued, thus effecting, according to estimates, a saving of $100,000 a year in clearance charges for member firms. While the exchange lost this revenue, it was also estimated that the change would produce a saving of $48,000 annually in the rentals of machines and on taxes.

(4) In view of possible air-raid alarms or other emergencies, the rules of the exchange were amended "to provide for flexibility in trading hours by making it possible to postpone the opening; to advance the closing; to close temporarily and reopen; or to extend trading hours beyond the normal closing."

(5) The SEC adopted, on Nov. 27, a rule "requiring all registered brokers or dealers dealing with the public, to file, on a standard type financial questionnaire, annual audited financial reports with the Commission." A copy would also be sent to the exchange, in accordance with its requirements effective since 1924, in place of the form used previous to this standardization.

(6) With respect to the merchandising of blocks of securities, the president of the exchange on Aug. 27 requested a group of the board of governors to consult with him in a study of this important subject.

Changes with Respect to the Practices of Listed Corporations.—On Jan. 16, 1942, the department of stock list suggested to the presidents of listed corporations "that their inventory policy be disclosed in annual reports to stockholders and transmitted a bulletin prepared by the Committee on Accounting Procedure of the American Institute of Accountants which discussed special reserves made necessary by war-time conditions." The chairman of the SEC also reported, on Aug. 17, that "following a second meeting with representatives of the financial industry, standard financial report forms would be adopted soon, and that consider-



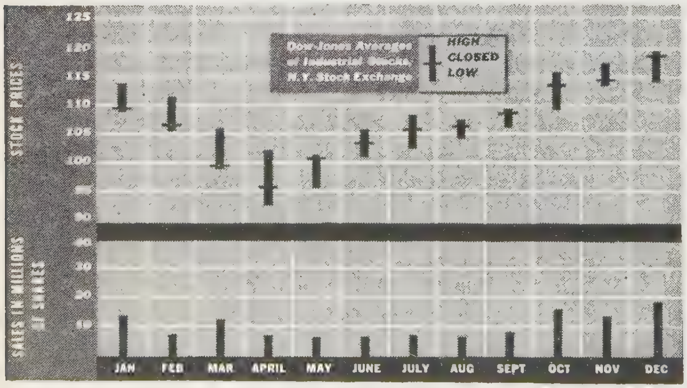
TRADING IN STOCKS on the New York Stock Exchange: yearly range of prices and number of shares sold, exclusive of odd-lot and stopped sales

able ground work had been made in the solution of other problems."

According to press accounts, the stock exchange also recognized the fact that many corporations would be unable to file their annual financial reports by the customary dates required by their listing agreements with the exchange. Upon application by the corporations, showing the necessity, the exchange expressed a willingness to extend the time limits for an appropriate period beyond three months after the close of the fiscal year, and to a date 15 days in advance of a postponed annual meeting or the reconvening of an adjourned meeting.

Proposed Legislative Changes.—On Feb. 10 the president of the exchange and the president of the Association of Stock Exchange Firms appealed to the committee on ways and means of the New York assembly for relief from the high state stock transfer tax. Governor Lehman signed the Coudert-Mitchell bill (passed by the legislature on April 24), eliminating the double taxation on odd-lot transactions. The president of the exchange explained that this "was a measure of tax relief which long had been needed and from which investors will derive encouragement." He further expressed the hope that the legislature "would consider additional relief and realistically examine the whole stock transfer tax structure."

Changes in Commission Charges and Membership Dues.—On Feb. 26 the board of governors adopted amendments to the constitution "raising minimum non-member and member commission rates approximately 25% and 10% respectively. The amended rates were approved by the membership on March 12 and became effective March 16."



SALES AND PRICES on the New York Stock exchange, 1942

Effective May 1, 1942, amendments to the constitution of the exchange were approved by the board of governors, "covering a comprehensive revision of the rates of membership dues and other charges payable to the exchange by members and member firms so as to provide a fairer allocation of charges in relation to the services and benefits received."

Financial Record of the New York Stock Exchange.—According to the annual financial statement of the exchange and affiliated companies, the year ending Dec. 31, 1941, showed a net loss for the year, after depreciation, of $2,229,560, compared with $981,348 in 1940. As in previous recent years, the price of New York Stock exchange seats remained exceptionally low throughout 1942.

The prices varied between a minimum of $17,000 and a maximum of $30,000. These prices compared with a minimum of $19,000 and a maximum of $35,000 for 1941, and a minimum of $33,000 and a maximum of $60,000 for 1940. (*See* also BUSINESS REVIEW.) (S. S. H.)

Stomach Disorders: *see* ALIMENTARY SYSTEM, DISORDERS OF.

Stone.

The following table lists the production of the various types of stone in the United States, so far as data were available at the close of 1942.

Production of Stone in the United States
(In thousands of short tons or thousands of dollars)

Name of Stone	1940			1941		
	Dimension	Crushed	Total	Dimension	Crushed	Total
Basalt	22	15,694	15,716	10	17,927	17,937
Granite	658	10,222	10,881	782	13,517	14,299
Limestone	1,082	111,576	112,658	814	132,350	133,164
Marble	89	151	240	69	107	176
Sandstone	172	6,327	6,498	183	7.409	9,592
Others	83	7,656	7,740	89	9,851	9,940
Total	2,107	151,626	153,733	1,947	181,161	183,108
Value	$21,417	$138,627	$160,044	$21,396	$173,942	$195,338

Dimension Stone.—Sales of dimension stone in 1941 were 8% less in quantity than in 1940, but only 1% less in value. Building construction used 83% of the total, with small percentages going to monumental work (marble and granite only), paving, curbing and flagging. In addition to the stone listed above, 180,990 tons of slate was sold as dimension stone in 1941.

Crushed Stone.—Sales of crushed stone in 1941 were 181,160,980 short tons, an increase of 19% over 1940, while value increased 26%; this does not include 42,735,000 tons of crushed stone used in the production of cement, 11,827,000 tons used in making lime, or 437,670 tons of crushed slate. Concrete and road metal took 61% of the total, metallurgical and refractory uses 16%, agricultural uses 7% (all limestone), and railroad ballast 6%. (G. A. Ro.)

Straits Settlements.

A British crown colony, under Japanese occupation in 1942, one of the three principal administrative divisions of British Malaya, the others being the Federated and the Unfederated Malay States (*qq.v.*). Area of the Straits Settlements 1,356 sq.mi.; pop. (estimate of 1941) 1,435,895, divided racially as follows: Europeans 18,101, Malays 315,629, Eurasians 13,540, Chinese 927,003, Indians 148,851, others 12,771. The capital is Singapore (*q.v.*). It is normally under the administration of a governor with an advisory council. The governor since 1934, Sir Thomas Shenton Whitelegge Thomas, was made a prisoner of the Japanese in 1942. Along with the rest of Malaya, the Straits Settlements was overrun by the Japanese in Jan. and Feb. 1942 (*See* JAPAN; WORLD WAR II).

Education, Finance, Communications.—There were 420 schools, with 83,078 students, in 1940. The unit of currency was the Straits dollar, equivalent to 47.51 U.S. cents in 1941. The pound sterling, however, was often used in financial statements. Revenue in 1941 was £5,501,790 and expenditure £7,056,729. The unrealized budget of 1942 called for revenue of £6,969,793, expenditure of £6,804,603. Imports in 1940 were £96,146,000, exports (including re-exports) £131,257,000. At the end of 1940 there were 1,073 mi. of metalled roads and 133 mi. of gravelled roads in the colony. There were radio stations at Singapore and in Province Wellesley, for Penang. (W. H. Ch.)

Strategic Mineral Supplies.

When World War II started in Sept. 1939, the official list of strategic and critical materials as compiled by the U.S. Army and Navy Munitions board included nine strategic and nine critical materials of mineral origin, the main differentiation between the two being that for the former major shortages of supply were anticipated, but for the latter only minor shortages. After the United States was brought into the war, practical considerations led to the replacement of the former strategic and critical list by the War Production board's Material Substitution and Supply List, containing a listing of more than 500 products, arranged in three groups and graded according to necessity in the war effort and adequacy of supply.

Group I, supply is inadequate to meet demands;

Group II, supply is approximately equal to demands;

Group III, supply is in excess of demands.

Those members of Group I that are shortest in supply are marked with a star, so that in a way, these starred items correspond approximately to the former strategic list, and the unstarred items to the critical list. Omitting a number of materials that are on the list because of lack of production or conversion facilities, and considering only those there because of scarcity of the basic raw material, it is to be noted that the latest copy of this list, issued Nov. 6, 1942, includes a total of 28 items of mineral origin, nine of which were starred, as follows:

*Magnesium
*Aluminum S
*Copper
*Tin S
Cadmium C
Zinc
Steel
*Tantalum
Beryllium
Rhodium
Lithium
Iridium
*Molybdenum
*Nickel S
*Vanadium C
*Tungsten S
Cobalt
Chromium S
Asbestos C
Corundum
Cryolite C
Graphite C
Kyanite
Mica S
Quartz crystals
Sodium nitrate
Strontium
Talc

While there are nine starred items, just as there were nine former strategic items, only four of these are identical; of the others, three strategic items have a sufficient current supply to be listed in Group II, while of the other five starred items one was critical and four were not listed. Of the 19 unstarred items, two were formerly listed as strategic, four as critical, and the remaining 13 were not listed. The former strategic materials are indicated by S, and the critical by C. But one of the most important points is that the list includes copper, zinc and steel, with copper starred.

Space is lacking to discuss in detail the many reasons behind the fact that shortages in 1942 were so much different and so much greater than had been anticipated, beyond the brief statement that previous planning and estimates were based on the attitude that the United States had only to plan against its possible invasion; hence, as matters developed, requirements had to be successively enlarged for lend-lease aid, for following a rapid spread in the scope of the war geographically, as well as in intensity, and above all to meet the ever expanding demands of mechanized warfare, with its heavy consumption of metals.

TUNGSTEN CONCENTRATE from a Canadian refinery in Ottawa. The supply of this critical mineral, used in war industries to harden tool steel, became scarce after the fall of Burma in 1942. The new Canadian refinery, however, helped offset the loss

This development can best be illustrated by a concrete example, and for this aluminum is selected, as it is near the top of the list in relative scarcity. The first proposal for an increased plane output called for 4,000 planes in a year, to build which would have required only about one-sixth of the current output of aluminum, leaving five-sixths for civilian uses. A recent official report announced that plane construction in 1942 would be approximately 49,000; when one takes into consideration that on top of this twelve-fold increase in number, the average size of the planes being built was approximately doubled, and that the 1943 program would probably call for twice as many as that of 1942, one can better understand why aluminum production capacity was increased to a point where it was expected to reach 1,050,000 tons in 1943, or more than six times the 1939 output.

Another phase of the problem is the role that proper control of the distribution of strategic mineral supplies can be made to play in the future, in avoiding a repetition of world wars. The Mineral Sanctions provisions of the League of Nations were planned to provide such protection, but failed, partly because the United States, not being a member of the League, was not subject to its control, and partly because the enforcement of sanctions at the time that they were needed happened to be contrary to the political and economic interests of certain members of the League, and no effective control could be secured without their support. (G. A. Ro.)

Strikes and Lock-outs.

The United States, Canada and Great Britain publish current statistics of strikes and lock-outs, their causes and results, together with detailed reports upon the more important strikes of each year. Most of the other nations report them less regularly; some not at all. The Canadian department of labour published a report on strikes throughout the world in the *Labour Gazette*, March 1937.

The political situation in Germany, Italy, Russia and Japan made it "inadvisable" for wage earners to undertake strikes. World War II added Czechoslovakia, Poland, France, Norway,

Table I.—*United States: Number of Strikes, Workers Involved, and Man-Days Lost, 1935—1941**

Monthly Labor Review, United States Bureau of Labor Statistics (May 1942)

Year	Number of Strikes Beginning in Year Indicated	Workers Involved in Strikes Beginning in Year	Man-days Idle During Year
1935	2,014	1,117,213	15,456,337
1936	2,172	788,648	13,901,956
1937	4,740	1,860,621	28,424,857
1938	2,772	688,376	9,148,273
1939	2,613	1,170,962	17,812,219
1940	2,508	576,988	6,700,872
1941	4,228	2,362,620	23,047,556

*Strikes involving fewer than 6 workers or lasting less than 1 day are not included in this table nor in the following tables. Notices or leads regarding strikes are obtained by the Bureau from more than 650 daily papers, labour papers, and trade journals, as well as from all government labour boards. Letters were written to representatives of parties in the disputes asking for detailed and authentic information. Since answers to some of these letters had not been received, the figures given for the late months are not final.

Compiled from *The Monthly Labor Review*, U.S. Bureau of Labor Statistics.

Denmark, the Low Countries, Bulgaria, Rumania, Greece, Finland, to the area in which strikes would be ruthlessly suppressed.

The year 1940 saw less strike activity in the United States than in 1939 but a definite increase in the number of strikes toward the end of the year which continued on into 1941, when strike activity was much greater than in either 1939 or 1940. There were 4,228 strikes started during 1941, compared with 2,613 in 1939 and 2,508 in 1940.

1940	192	63,469	268,169
1941	268	97,580	425,938

Compiled from *Canadian Labour Gazette.*

In 1939 there was a loss of 17,812,219 man-days, in 1940 only 6,700,872, and in 1941, 23,047,556. During 1937 the loss of man-days was 28,424,857. The maximum loss of man-days in any month of 1941 was 7,099,392 in April. The next largest month was 4,876,744 in April 1939.

Table I shows for the United States the number of strikes, workers involved and days lost, 1935–41. The year 1937 was still the record year in number of strikes since 1917. The number of strikes began to increase in 1933 and rose steadily through 1937. The number declined steadily through 1940 and increased again in 1941.

The monthly reports on strikes issued by the U.S. bureau of labour statistics indicated that close to one-half of the strikes of 1941 involved some question of union recognition, with wages the other major issue. This distribution was characteristic of 1937 through 1941. Tables IV and V show the causes of British disputes in 1942 and their results. Two contrasts with the U.S. situation stand out—in Table IV the absence of "union recognition" unless included in "questions involving trade union principles," and in Table V the large percentage of the strikes which ended definitely in favour of the employers.

Canada had only 192 strikes in 1940 involving 63,469 workers and but 268 involving 97,580 employees in 1941. (*See* also Labour Unions; National Labor Relations Board; United States; War Labor Board, National.) (D. D. L.)

Strontium. War demand for strontium salts, used in tracer bullets and signal flares, increased the demand for the usual supplies for civilian uses that had been met by imports, and caused the opening of mines on the west coast that had been practically idle after 1918. Shipments of strontium minerals from

United States mines in 1941 amounted to 4,724 short tons, valued at $69,054, more than doubling the 1940 output. At the same time imports increased from 2,751 tons in 1940 to 3,172 tons in the first nine months of 1941, mostly from England, but with substantial amounts from Mexico, a new source of supply.

(G. A. Ro.)

Submarine Warfare.*

The War on Shipping.—*Axis Submarine Campaign.*—The question of maintenance of adequate shipping against the depredations of axis submarines was the most vital one of 1942, with the advantage, at least in Atlantic waters, largely in favour of the axis powers. With the opening of new fronts all over the world the problem of supply lines became ever more pressing and, with merchant bottoms being sunk faster than new ones could be commissioned, the United Nations seemed destined to eventual defeat. By year's end, however, new factors had developed to such an extent that, although the submarine menace was still one to tax the utmost powers of the Allies, there was cause for a much more optimistic view of the final outcome.

Total losses of usable Allied and neutral merchantmen prior to 1942 were estimated to be 8,229,000 tons, increasing each year. In 1942 the vise of censorship clamped down tight; the United States announced only the numbers of ships lost, without mention of size, while London vouchsafed no information whatever. German pretensions were, however, still received through shortwave broadcasts. In October Berlin claimed a total toll for the year of 6,600,000 tons; extended through December this would amount to approximately 8,000,000 tons. Previous experience with nazi claims proved they were exaggerated by nearly 100%. If this was still true it may be guessed that actual shipping losses of the United Nations amounted to about 4,000,000 tons during 1942, or a total loss to date of somewhat in excess of 12,000,000 tons. As a check on this figure we have an unofficial estimate early in Dec. 1942 that a total of 2,029 United Nations merchantmen were sunk during the course of the war. Assuming that seagoing cargo ships displace an average of 6,000 tons this also amounts to a total loss of slightly more than 12,000,000 tons. We hazard a guess, then, based on the meagre information available, that losses in Allied and neutral merchant bottoms during 1942 amounted to approximately 4,000,000 tons (greater than in any preceding year of the war) and that total losses for the war up to the close of 1942 were close to 12,200,000 tons.

As the year opened the submarine front was relatively quiet. The reason for this soon became apparent—a change in submarine strategy was under way and the U-boats were enroute to new hunting grounds. The new strategy quickly revealed itself. A large steamship was sunk off Nova Scotia about mid-January; the next day a tanker went down near Long Island, and five days later another was lost off North Carolina. It was evident that a large scale attack on shipping along the coast of the United States was being undertaken and that other areas were being denuded of U-boats to make this new offensive effective. By the end of January these attacks had extended the full length of the North American coast.

February saw an extension of warfare into the Caribbean, with daring attacks on tankers and the oil refinery at Aruba. Official London expressed grave concern and estimated that the axis powers had at least 100 submarines operating in the western Atlantic. Early in March Prime Minister Churchill voiced alarm at this "most serious increase in shipping losses" and added that "we are strained to the limit." The curve of sinkings rose steadily and the full import of the crucial situation began to be felt in the United States. Atlantic coastal shipping was the principal target of the marauders and North Atlantic convoys were comparatively free from assault.

By April the U-boats had worked steadily southward and the whole coast, from the bulge of Brazil to Newfoundland, was blanketed with submarines. The nazi strategy was plain to behold: (1) this new campaign was a co-operative gesture toward Japan; (2) these unprotected shipping routes were a lucrative hunting ground; (3) popular clamour in the United States might cause naval forces to be withdrawn either from the Pacific or from North Atlantic convoys; (4) the weakest point of American shipping, tanker strength, was singled out for special attention. But Washington refused to be stampeded into the trap; Pacific forces were undisturbed and North Atlantic convoys went on as before. This new battle had to go by default until its own special protection could be built up and put in operation.

In May and June, with the coming of summer, the curve of merchant sinkings rose more steeply, averaging three a day. The Caribbean and Gulf of Mexico became real hot spots. Mines laid by U-boats off Hampton Roads took a small toll. Attacks on the well-protected lend-lease convoys to Britain and Russia were at a minimum, except in the Barents sea, where combined air and undersea raids were carried out with questionable success. Late in June the navy department announced the installation of a convoy system along the Atlantic seaboard, and soon thereafter Germany admitted meeting stronger submarine defenses in this area. The month ended with a meeting in Washington between Prime Minister Churchill and President Roosevelt to discuss joint means of combating this increasing submarine threat.

July was probably the peak month of the war for shipping losses. The coastal convoy system was not yet in full operation and beaches throughout the length of the Atlantic seaboard were strewn with wreckage and defiled with fuel oil. About mid-July Navy Secretary Knox announced that shipping in the Caribbean was being escorted and that convoys would soon be established in the Gulf of Mexico. Soon thereafter the navy department reported that its meagre coastal anti-submarine forces had been augmented by British and Canadian vessels and by some units of the royal air force. That counter-measures were becoming increasingly effective was certain, and was corroborated by the statement of the nazi submarine admiral, Doenitz, that he did "not underestimate the enemy."

As the convoy system improved, August witnessed a distinct drop in sinkings in the western Atlantic and operations of axis submersibles shifted steadily southward toward the African trade routes. Increasing attention was also paid to the arctic route to Russia, and the gravity of this situation was accented by the admission that some arctic convoys were losing as much as 50% of their cargoes. An increased tempo of warfare against convoys near the Canadian coast was also noted. The German radio claimed in late September that one combined air and undersea attack on a 45-ship arctic convoy netted 38 ships, totalling 270,000 tons; this was refuted by British authorities, who insisted that the great majority of ships reached their Russian destination. Also during September Berlin claimed a highly successful U-boat attack on a westbound convoy, sinking 19 ships for a total of 122,000 tons.

The last quarter of the year saw a reduction in shipping losses on all routes, with the possible exception of those servicing Africa. This improvement was due in part to more effective anti-submarine measures on all fronts, and in part, especially in the North Atlantic, to the advent of winter with its attendant heavy seas and briefer periods of daylight. In October a flurry of U-boat activity off the bulge of North Africa again indicated the possibility of axis use of Dakar as a base. Later reports of numerous U-boats operating off Cape Town, Freetown and Sierra Leone lent credence to the probability that African communications had become a principal winter target. North Atlantic sea lanes were still receiving attention, however, and occasional raiders still showed up off the Atlantic seaboard and in the Caribbean.

---

*All assertions or opinions contained in this article are the private ones of the writer and are not to be construed as official or reflecting the views of the U.S. navy department or of the naval service at large.

The outstanding event of November was the invasion of North Africa by British and United States forces. This involved an armada estimated as high as 850 ships, including warships. The axis powers certainly had some warning of this attack and disposed an underseas fleet to meet it, but, as only one ship was reported lost before the landing, it is probable that they expected the blow to strike farther south, perhaps at Dakar. But before transports, supply ships and tankers could be completely unloaded, U-boats had concentrated off the area of operations, and Berlin claimed a total of 89 merchant ships sunk or damaged, amounting to 183,000 tons. The United Nations reported heavy attacks, and Admiral Sir Andrew Cunningham estimated that at least 50 submarines were lurking off the African theatre. The loss of a British aircraft carrier and 15 transports and cargo ships was admitted. The opening of the African front necessitated long and vital supply lines from the United States and there was no doubt that these would be in constant danger of U-boat attacks; the Strait of Gibraltar and the roadstead at Casablanca are practically in the front yard of those based on the Bay of Biscay.

At year's end U-boat activity on the Atlantic seaboard had dwindled to insignificant proportions, but the sea lanes of the North Atlantic, off South America and Africa were still subject to deadly attacks. British officialdom, however, announced in late December that more than 100,000 merchantmen had been convoyed over all routes and that of these the losses were less than one ship in 200.

Japan's Submarine Effort.—The most welcome disappointment of the year was the unproductive use of Japan's large fleet of submersibles. Except for isolated stabs at unescorted ships successful attacks on the huge war shipments to Hawaii and Australia were lacking; whether this was due to lack of effort or was a tribute to effective convoys was not known. Possibly Japanese strategy called for use of its submarines with its fleet, operating against warships, but it was more probable that Japanese psychology failed to measure up to the submarine's exacting demands. During the summer a number of merchant sinkings were reported in Mozambique channel, probably the work of Japanese submarines working out of Vichy Madagascar; after the British cleaned up that island in September this activity ceased.

British Submarines Against Supply Lines.—The small but efficient force of British submarines continued its depredations on axis supply lines from Italy to Libya, and these undoubtedly had a real effect on the Egyptian campaign. In September Admiral Max Horton, chief of Britain's submarine forces, announced that his boats had, throughout the war, accounted for 300 axis supply ships. While most of these were in the Mediterranean, it was also apparent that there was still some activity against nazi supply routes to Norway and the Low Countries. A few submarines were also known to be operating briefly against the Japanese in the Indian ocean. The main effort, however, was directed against axis lines in the Mediterranean, and it was here that the greatest successes were achieved.

Russian Submarines in Commerce Warfare.—In February British official sources announced that, since Russia's entry into the war, soviet submarines had accounted for 43 axis ships, totalling 170,000 tons. Spring brought forth repeated reports of successful actions in the Barents sea against German convoys to Petsamo. During the summer persistent reports emanated from Sweden that its convoys to Germany and Finland were being attacked, with some success, in the Baltic. Although Russia denied attacks on neutral Sweden there seemed little doubt that Germany had a submarine problem of its own, in its own back yard—the Baltic. As far as was known Red submarines in the Black sea and at Vladivostok were inactive.

Pig-boats in the Pacific.—United States submarines, known affectionately as pig-boats, achieved an enviable record in the western Pacific. Strategists in Washington early realized that one of Japan's weakest points, with her ever-extending lines of communication, was her shortage of merchant bottoms; accordingly the decision to attack this weakness with everything available was speedily reached. The first indication of this was in early January when Tokyo bleated about the loss of two large ships in its home waters. From then on navy communiques reported an ever-growing list of vital Japanese shipping sunk. Early in the year a number of submarines operated from the Philippines and Java, and later from Australia, but, while these scored some notable successes in the China sea and southern waters, the bulk of sinkings came from those that made the long trek from Pearl Harbor to Japan. Late in December Premier Tojo admitted losing 65 merchantmen and warned that this loss was serious. But United States figures at the end of the year indicated that, considering cargo bottoms only, its submarines had sunk 85, probably sank 12 more, and damaged 18. Using, as before, an average of 6,000 tons per ship, it is estimated that over 500,000 merchant tons can be credited to the pig-boats.

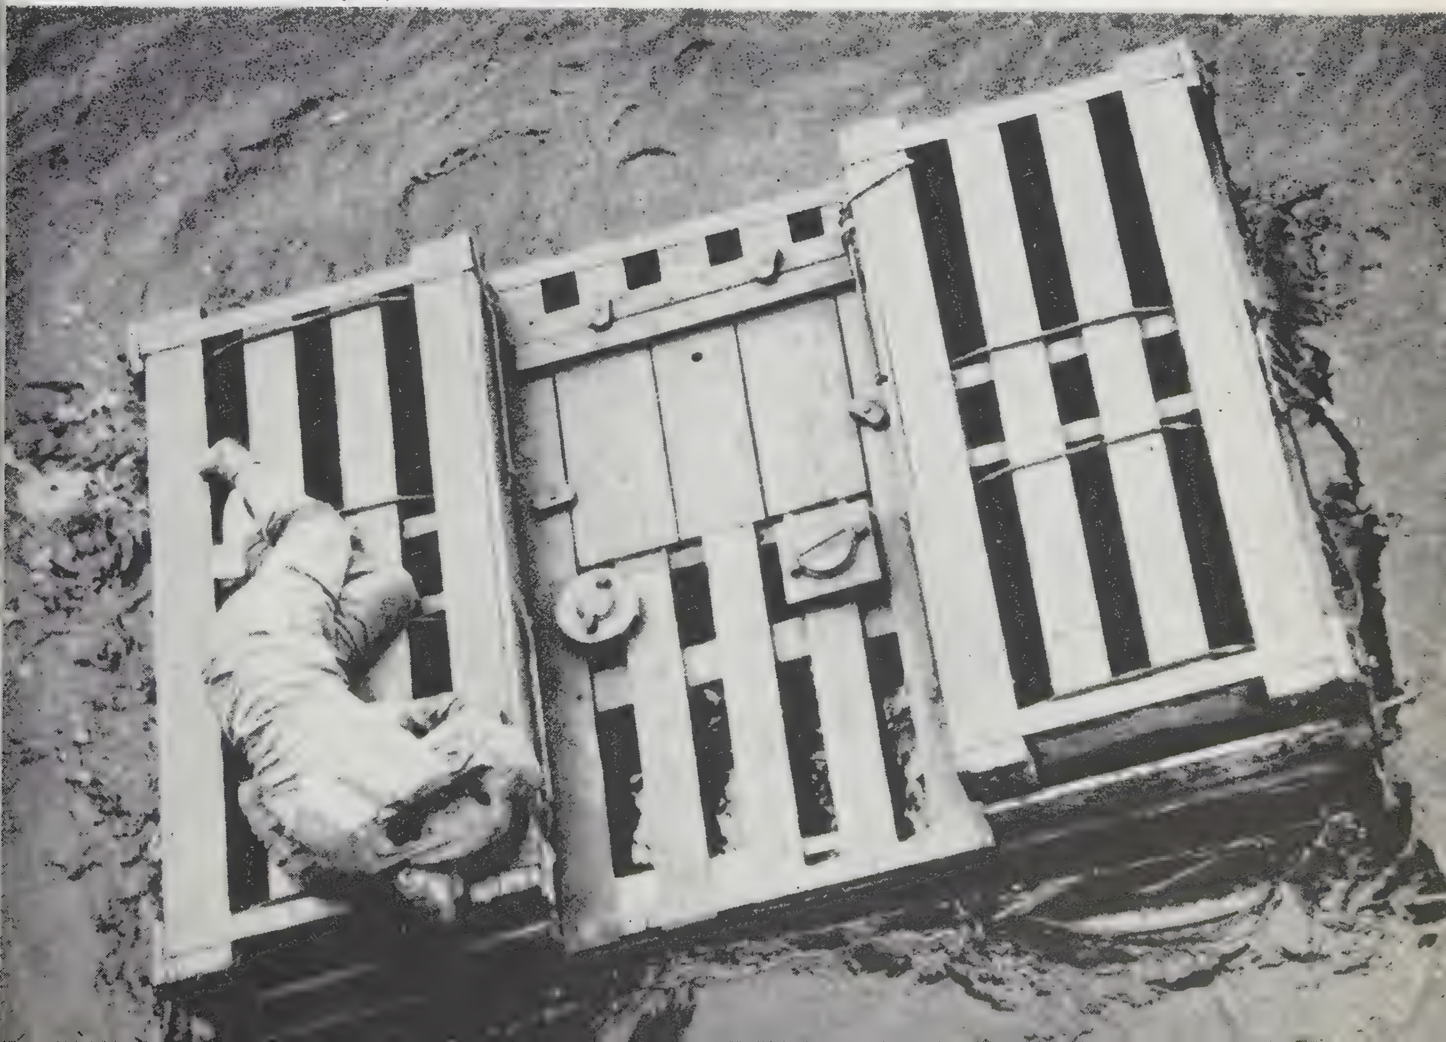
Combative Measures.—As the trend of the whole global war might well be influenced by shipping losses, every effort was bent toward stemming the tide of U-boat warfare. Combative measures took several forms. Most important was extension of the convoy system, but, because of lack of escort vessels in suitable numbers to cover all threatened areas, this was difficult. As soon as one shipping lane was well protected the elusive U-boats shifted to another route. The only solution was fully to protect one sea lane at a time, extending the system as new craft became available. All types of small vessels were used in this work—destroyers, corvettes, patrol craft, yachts—augmented by planes and blimps. The latter, with their ability to hover and attack, proved unexpectedly valuable. In June Mexico's entry into the war added its small navy to the almost non-existent escort forces in the Gulf of Mexico, and during the same month the convoy system was partially installed from Florida to Maine. By midsummer effective new types of submarine killers were coming off the ways in flocks, and the system was gradually extended to the Caribbean and later to the Gulf of Mexico. The efficiency of these measures was proved by the withdrawal of most axis submarines to happier hunting grounds. Brazil's navy and air force entered the fight when that country declared war in August, and this reinforcement helped considerably in protecting South American waters. At year's end it appeared that the important shipping lanes still to be safeguarded were the African coastal route and the United States-Good Hope lane. The coming of Dakar into the Allied fold should contribute greatly to the ease of this task—when and if strong anti-submarine forces are based on this strategic port.

The struggle to launch new bottoms faster than old ones were destroyed was another important phase in combating the U-boat. British yards built rapidly and well, but their capacity was limited. The real effort was expected to be made in the United States, where President Roosevelt set a seemingly impossible goal of 8,000,000 tons of new shipping in 1942. Shipbuilders, faced with a shortage of critical materials and with labour troubles, accomplished miracles. In April Maritime Commissioner Vickery reported that the United States was building two ships a day, but replacements were still far behind sinkings; in July he announced

PHOTOGRAPH OF A RAMMED GERMAN U-BOAT, close by the Canadian destroyer "Assiniboine" which sent it to the bottom of the north Atlantic in 1942. The German crew surrendered just before the submarine sank

GERMAN "SUBMARINE FORTRESS" on the Atlantic coast, built to protect docked U-boats from aerial attack. This photograph was smuggled out of German-occupied France in 1942

CHINESE SEAMAN, unconscious from exposure and cold, adrift on a life raft ust before his rescue by a Canadian minesweeper in Jan. 1942. He was one of a few survivors from a merchant ship torpedoed off Nova Scotia



that the building rate had now passed the rate of United States losses—but not of United Nations losses; in September the rate finally reached three new ships a day. The Allied invasion of North Africa in November created a new supply problem and increased the number of bottoms, especially tankers, required; to offset this Admiral Cunningham asserted that the opening of the Mediterranean to Allied shipping would, by obviating the long cruise around Good Hope, amount to a saving of at least 2,000,000 tons. Although losses were still dangerously high there was reason for hope in the splendid achievements of American and British shipbuilders and it seems certain that the goal of 8,000,000 tons was reached. (*See* also SHIPBUILDING.)

Heavy air attacks on the bases and building yards of U-boats was another method employed to combat the peril. Submarine bases from the eastern Mediterranean to northern Norway were harried with ever-increasing bomb-loads, with special attention to bases in occupied France—Le Havre, Brest, St. Nazaire, La Pallice. A commando raid on St. Nazaire in March introduced a change in technique; reminiscent of the Zeebrugge raid in 1918, it employed an explosive ship to shatter the lock gates, presumably leaving the U-boats in the basin high and dry. Heavy bombing raids were also directed at submarine building yards at Hamburg, Emden, Bremen, Flensburg, and faraway Danzig. Even factories in the interior, known to be manufacturing submarine parts, received their share of attention, but the real effect of these raids on retarding submarine construction can only be guessed at. Germany countered the bombing of bases by building bombproof shelters over the slips where U-boats lay up for rest and overhaul and it was doubted if much vital damage was inflicted.

Anti-submarine material was undergoing constant improvement. The use of echoing devices against submarines, both submerged and on the surface, developed rapidly, with excellent results. Depth charges were improved to cope with strengthened U-boat hulls. New types of patrol craft were being turned out in numbers that should soon be sufficient to give all coastal shipping routes a reasonable amount of protection.

In summary, then, it appeared that the menace of axis submarines was still the chief obstacle to be overcome if the United Nations were to win the war. Global warfare involved a multiplicity of supply lines and these had to be adequately protected if far-flung troops were to operate successfully. By the close of 1942, such was not the case. Shipping losses remained dangerously high. U-boats were probably produced faster than they were destroyed. But there was reason for cautious optimism. The increase in tonnage losses over 1941 was largely due to lack of protection of American shipping in the western Atlantic; this deficiency was almost overcome. In addition, the rapid rate at which new bottoms were launched, the measures taken to retard U-boat construction, and the improvement of anti-submarine material gave rise to the belief that 1943 would witness a downward rate in sinkings and the beginning of the end of U-boat depredations.

Submarines in Naval Actions.—Germany, Italy and the United States made the principal objective of their submarine fleets the shipping of their respective enemies. Great Britain, too, concentrated on lines of communication but, as these lines were supplying enemy forces, the objective had also a military nature. Japan's lack of success against shipping intimates the possibility that its submersibles were working mainly in conjunction with surface naval forces, against naval objectives, although their success in this field was also limited. There were, however, numerous occasions, planned or otherwise, when submarines operated destructively against combatant vessels.

In January the Admiralty admitted the loss of the light cruiser "Galatea," which received three submarine torpedoes off Alexandria. Shortly thereafter a United States submarine reportedly sank either a Japanese transport or auxiliary carrier. The same month the Admiralty announced that a British submarine had made a sure kill of a U-boat and had damaged an Italian destroyer. Late in January a Nipponese aircraft carrier was reported probably sunk by a United States submarine in the action at Macassar straits. The month ended with the delayed report of the loss of H.M.S. "Barham," British dreadnaught, in Nov. 1941, by four submarine torpedoes off the Libyan coast—a real prize.

Early in February the navy department announced the loss to a Japanese submarine of the naval oiler "Neches," and later in the month the Fighting French corvette "Alice" and the United States Coast Guard cutter "Alexander Hamilton" fell victims to U-boats while on escort duty in the North Atlantic. This was followed by the report that a British submarine had damaged a nazi cruiser, believed to be the "Prinz Eugen." Early in March the navy department claimed its pig-boats sank a Japanese destroyer and put out of action an aircraft carrier and three cruisers, probably near Java. Shortly thereafter the old United States destroyer "Jacob Jones" was a U-boat victim off the Delaware coast, and British submarines reported the sinking of two Italian submarines in the Mediterranean. As March ended, the Admiralty announced the loss of the light cruiser "Naiad" by submarine torpedo, probably while escorting a Murmansk convoy.

April opened with the reported loss of a Japanese light cruiser to a United States submarine, and the damaging of two more by the same pig-boat, operating south of Java. Following this the sinking of an Italian heavy cruiser off Libya by a British submarine was reported. In the southwest Pacific a United States submarine claimed the sinking of a Japanese destroyer, while later in the month another waylaid and probably sank a Japanese submarine. As the month closed the German radio claimed that U-boats had entered the Mediterranean for some months past and were responsible for sinking three cruisers, seven destroyers, four corvettes and five patrol boats in 1942; all these losses were not reported by the Admiralty and are subject to some doubt.

Early in May the navy department announced the loss of another old destroyer, "Sturtevant," off the Florida coast, and soon thereafter the Admiralty admitted that the heavy cruiser "Edinburgh" had gone down before submarine torpedoes, probably in an arctic convoy. About mid-month a navy communique stated that a Nipponese submarine had fallen victim to a pig-boat in the western Pacific, while in the Caribbean the United States destroyer "Blakely" suffered a damaging submarine attack. A later communique announced serious damage by submarine to a Japanese heavy cruiser in the western Pacific.

June was a banner month for submarines. In the Midway action a pig-boat scored three hits on the Mikado's carrier "Soryu"; due to combined bomb and torpedo pounding this prize later went to the bottom. But the score was soon more than evened. The United States carrier "Yorktown," returning disabled to Pearl Harbor, was waylaid by a Japanese submersible which sank not only the "Yorktown" but also the destroyer "Hammann," which lay alongside. At mid-month, during heavy convoy actions in the Mediterranean, a British submarine captain reported that he sank an Italian heavy cruiser and damaged the battleship "Littorio." Other June victims were an Italian destroyer and the United States seaplane tender "Gannet."

In July United States submarines became active against Japanese forces operating in the Aleutians. Attacks resulted in the sinking of six destroyers, the probable sinking of one, and the damaging of another. These actions were followed by reports from Moscow that a Russian submarine had torpedoed and seriously damaged the nazi battleship "Tirpitz" during an arctic convoy battle; this is unverified. In the western Pacific proof of the sinking of a large Japanese destroyer by a United States submarine was afforded by a photograph of the stricken vessel taken through the periscope, the first of its kind.

In early August the Berlin radio claimed the sinking in the Mediterranean of the British carrier "Eagle" during an attack on a Malta convoy; this loss was quickly acknowledged by London. During the same action a British submarine claimed heavy damage to an Italian cruiser. Late in the month United States submarines in the Aleutians sank an unidentified Japanese cruiser or destroyer and probably sank another destroyer. In September Admiral Horton announced that to date British submarines had sunk a total of 87 axis warships of all categories. In mid-September a telling blow by a Nipponese submarine was struck in the southwest Pacific when the United States carrier "Wasp" received three torpedoes; aggravated by magazine and gasoline explosions the damage was such that she quickly sank. Soon after this the Canadian Navy Minister admitted that his destroyer "Ottawa" and the escort vessel "Racoon" had fallen victims to U-boats in a convoy battle, while Berlin claimed two destroyers and a corvette in what was probably the same action. In another axis attack on an arctic convoy Berlin claimed the sinking or "knocking out" of four destroyers and two patrol craft, while the Admiralty admitted losing the destroyer "Somali" and the minesweeper "Leda." At month's end Berlin claimed the U-boat sinking of another destroyer.

In October a Japanese heavy cruiser and large seaplane tender went down under attack by United States submarines in the western Pacific. November reports showed an auxiliary Nipponese carrier attacked by a pig-boat in the same area and left burning. The African coup of the United Nations was cheap in warship losses, the price being one British carrier, probably a converted job, although Berlin also claimed damage to a British destroyer. Soon after this the navy department reported the sinking in the western Pacific by United States submarines of a Japanese destroyer and patrol vessel. The last November report was that of the damaging and beaching of the United States gunboat "Erie" as a result of submarine attack in the Caribbean.

In December the probable loss of two more Japanese destroyers was announced—victims of United States submarines. Toward the end of the month London reported that an Allied (probably Greek) submarine in the Mediterranean sank an axis destroyer. At year's end the total warship toll for United States submarines was announced to be 21 sunk, 8 probably sunk and 9 damaged. Those listed as sunk were 3 cruisers, 12 destroyers, 2 tenders and 4 of miscellaneous type.

The most fantastic claim of the year was entered by the commander of the Italian submarine "Barbarigo." In May he reported having sunk off Brazil an American battleship under destroyer escort; in July he claimed to have placed four torpedoes in the hull of another United States battleship off Africa, causing its total loss. For these exploits he was showered with honours and promotions, but in October his claims were thoroughly spiked by British data which proved his attacks were carried out, respectively, on a British freighter and corvette.

Submarines were used for military purposes other than direct attack on enemy vessels throughout 1942. Early in the year it was reported that U-boats were being used as troop transports in the Mediterranean. The diary of a captured nazi soldier also referred to 6,000-ton U-boats carrying troops and supplies to Libya, but this was considered doubtful. It was possible, however, that the American descent on Makin island was secretly accomplished by use of large submarines as transports for marine raiders.

Inconsequential bombardments have been carried out sporadically by Japanese submarines at objectives on Australia, Canada, Oregon, California, New Hebrides, Samoa and Midway. The same manoeuvre when indulged in by U-boats at Aruba and Curaçao had somewhat better results. The only report of Allied submarine bombardments came late in the year when a British submarine, on three successive nights, shelled the railroad between Tripoli and El Agheila and damaged it considerably.

Submarines of all nations were probably used for all-important reconnaissance and observation of harbours; Admiral Nimitz stated in June that his pig-boats had performed brilliantly as scouts. During the siege of Bataan and Corregidor it was officially announced that a submarine had slipped at night alongside a Corregidor dock, landing ammunition and bringing off treasure and important passengers. Judging by the lack of other submarine activity during this period and the large number of evacuees it is probable that a regular ferry service was then in operation between Australia and Corregidor.

Submarines also saw use in transporting spies, the first reported instance being the landing of nazi saboteurs on the United States coasts in June. The secret mission of General Mark Clark to North Africa, paving the way for invasion, was transported by a British submarine, and the same craft also made possible the escape of the French General Giraud from a Vichy-French port.

Submarine Losses.—*Germany and Italy.*—The European axis powers admitted no losses whatever during the year. In 1941 it was estimated that nearly 200 axis submarines met death at the hands of their enemies. A search of the records for 1942 indicated that only 11 individual sinkings were officially claimed by the United Nations, while 38 more were reported unofficially—a total of 49. In September the Admiralty's First Lord Alexander stated that losses during July and August had been the highest of the war, and at the same time the Admiralty said it believed that Italy now had little more than half its original force remaining. In October Mr. Alexander surprisingly claimed that 530 axis submarines had been sunk or damaged during the course of the war by the British and American navies alone, not counting those sunk by air forces. As this figure was far in excess of any previously given out there was a tendency by the press to discount it, but on further analysis it seemed likely to be correct, although in accepting it one must remember that "damaged" does not infer lethal injury. It was known that the rate of U-boat construction was high and, as the increase in numbers of U-boats at sea was not proportionately larger, it was safe to assume that many were being lost. Because of the nature of submarine operations losses could never be determined definitely by anyone except the nation that sent them out and failed to get them back, but this writer believes that German and Italian losses would eventually be revealed to average over 200 a year.

Japan.—Official United States sources announced the sinking of 12 Japanese submarines during 1942, and unofficial claims were made to 14 more. In view of the paucity of Nippon's submarine operations and of anti-submarine measures in the Pacific the unofficial claims should probably be discounted. But the number sunk was undoubtedly greater than that officially claimed, for the reason that official claims were made by the United States only on definite proof. It was estimated that Japan lost approximately 20 submarines during the year.

United States.—Only four submarines were reported lost during the year, including the "S-26" which was not sunk by enemy action. The total for the war stood at five, and, except that some reports might be delayed, this was believed authentic. Considering the active role played by the pig-boats this figure was exceedingly low and paid a high tribute to both personnel and material. One Netherlands submarine, while operating with United States forces was also lost.

Russia.—Soviet officialdom maintained complete silence on submarine losses, and no axis claims of having sunk Russian submarines were noted.

France.—Vichy admitted the loss of a submarine in operations against the British off Madagascar. Three other Vichy-French submersibles were unofficially reported lost in action off Casablanca in November. Another three escaped from Toulon in December and joined the Allies at Algiers, while it was also reliably reported that 8 to 12 submarines at Dakar and one at Alexandria had cast their lot with the United Nations.

New Construction.—*Germany.*—There was no doubt that Germany, realizing the tremendous importance of these weapons, concentrated on building submarines and turned them out as rapidly as possible. The growing dearth of materials and labour, and the ever-increasing raids on submarine yards and dispersed parts factories, operated together to retard production and it is doubtful if the nazis' vaunted goal of a U-boat a day was reached. It is probable, however, that from 250 to 300 were produced in 1942 and that the fleet was still increasing in size. U-boats are of four general classes. The smallest, about 250 tons, is used for training and work in home waters. The next class is 517 tons, length about 220 ft., surface speed 16 knots, mounts 5 torpedo tubes and one 3.5-in. gun, with endurance of about 10,000 mi. at normal cruising speed. The newest class is of 740 tons, the increased size giving it the endurance (14,000 mi.) necessary for offensive patrols far from home. This type has a speed of 18 knots, mounts 5 torpedo tubes and a 4.1-in. gun; it also has better armour protection to withstand light gunfire while attacking in the awash condition. It is simple, rugged and easy to handle. The nazis also build U-boats of 1,060 tons, but these are comparatively few in number and are used chiefly as minelayers. There were persistent rumours of still larger types, some guesses running up to 6,000 tons, for use as troop carriers and submarine supply ships. The rumours lacked verification and were considered unlikely. The newer U-boats were built to withstand much greater depths than formerly, 500 to 600 ft., and more torpedo-carrying capacity was provided. It was probable that they were now equipped with radar for use on the surface for locating victims in darkness or fog, and they also made considerable use of the electric torpedo which, although it had a shorter range, left no wake. Underwater listening and echo devices were reported to be much improved. It had long been rumoured that Germany had a new engine which used fuel oil on the surface but operated submerged on a mixture of hydrogen and oxygen, and this rumour again received much notice during the year. As the practical drawbacks to such a design more than offset the advantages claimed, the rumour was seriously doubted. Another development was the magnetic explosive head on torpedoes, which detonates either on contact with the hull or when it passes under the keel of a vessel.

Italy.—The fascists build numerous types of submarines, although it was possible that, under the influence of nazi specialists, there was a trend toward standardization. No estimate of the rate of submarine construction was possible, but it was thought to be insufficient to replace those sunk. Italian submarines were known to be less rugged than U-boats and were less efficiently operated. The distinctively large conning towers were cut down in order to reduce the silhouette.

Japan.—Several types of submarines are built in Japan but the best known of these was the long-range I-class, which is able to make the round trip across the Pacific. These boats displace between 1,500 and 2,000 tons. Japan continued to use midget submarines, as was demonstrated by the ineffectual attack in June on Sydney. Three of these were sunk but were later raised and found to be 57 ft. long, larger than those used at Pearl Harbor; they were fitted with net cutters, 18-in. torpedoes and a 600-pound explosive charge. Most interesting was a keel fitting which indicated they were carried on the deck of a large submarine until launched for their close-in attack. Nothing was known of the current rate of Japanese construction, but lack of facilities should keep it low.

Great Britain.—No figures or estimates on submarine construction during the year were available. As British submarines achieved an enviable record of performance it might be expected that the value of this weapon was fully realized and that construction at least offset losses.

United States.—With American submarine operations aimed almost entirely at Japan the long-range 1,500-ton boat was favoured. Almost all new construction was of this capable class. While there had been little change in basic characteristics of these boats, all new developments in searching and ranging devices were installed. No exact figures as to numbers under construction were available, but building was greatly accelerated. In late spring congress voted $900,000,000 for new construction which would add more than 100 submarines to the flotillas, bringing the total eventually to well over 200. The excellence of design was proved by the few losses incurred and the fact that many stood up under prolonged and heavy depth-charging.

Russia.—No information available.

Submarine Personnel.—Despite rumours, there was no evidence that the morale of U-boat crews was in any way strained. While it was known that relatively green crews were seeing active service, the standard of performance remained high. The nazi submarine admiral, Doenitz, paid meticulous attention to morale; his officers were well-trained, were encouraged to be individualists and to use initiative, and were thoroughly propagandized in the party line. Democracy between officers and men was fostered. Italian personnel was thought to be much inferior to that of Germany, and Japanese crews, largely because of lack of achievements, were not rated highly. British morale remained excellent and officers and crews functioned brilliantly. The high spot of the year, however, was the splendid performance under gruelling conditions of the hitherto untried men of the United States submarines. The "Silent Service" had always been highly restrictive, and the careful weeding-out of the unfit throughout the years paid high dividends in the crucible of war.

Submarine Tactics.—Reports of nazi use of the famed "wolf-pack" tactics diminished during the year and it appeared that U-boats were operating with more freedom of movement. This was due partly, it is believed, to the inclusion of auxiliary aircraft carriers with important convoys, and partly to the fact that U-boat crews were lacking in the experience necessary to make such attacks profitable. While twilight seemed still to be the favourite time for attack, there were also many night attacks which were probably conducted by means of radio-echoing equipment. In such cases the U-boat approached its prey in an awash condition, ready for complete submergence if counter-attacked, in which case it would be entirely under in half a minute and might go to depths greater than 300 ft. to escape depth charges. The usual firing range for U-boats was from 500 to 800 yds., though in case of attack on a convoy this might increase to over 1,000 yards. As far as is known, submarines of other nations worked independently and the year brought forth no radical changes in tactics. (*See* also BLOCKADE; NAVIES OF THE WORLD; WORLD WAR II.) (E. E. HA.)

Sugar.

Effective consumer rationing of sugar was begun in the United States in 1942 at the rate of ½ lb. per person per week, and industrial uses of sugar were curtailed be-

SUGAR being unloaded from a freight car and stored in a warehouse of the Brooklyn navy yard in 1942, for later transfer to U.S. warships

cause of war-reduced imports and the need for diverting sugar to the manufacture of alcohol for smokeless gun powder. The United States production of cane sugar in 1942 was estimated by the department of agriculture as 537,000 short tons of 96° raw sugar, the second highest crop on record. The 1941 output was 419,000 tons and the ten-year (1930–39) average 355,000 short tons. Production was from two states: Louisiana, 420,000 tons in 1942 and 323,000 tons in 1941; Florida, 117,000 tons in 1942 and 96,000 tons in 1941. United States production of beet sugar in 1942, estimated from factory reports, was 1,664,000 short tons, equivalent to 1,780,000 tons raw value, compared with 1,484,000 tons, equivalent to 1,588,000 tons raw value, in 1941. The ten-year average was 1,363,000 short tons. Inadequate labour supply handicapped sugar beet growers throughout the season. The acreage of beets harvested was 979,000 ac., a new record; (754,000 ac. in 1941). The yield was 12.2 tons per ac. in 1942 compared with 12.5 tons per ac. in 1941. Acreage of sugar cane in 1942 was 302,900 ac., compared with 256,000 ac. in 1941. United States deliveries of sugar to the allies from April 29, 1941, to Oct. 31, 1942, were reported by the department of agriculture as 382,897,206 lb. of raw cane sugar and 165,721,716 lb. of granulated sugar. Shipments of sugar from Hawaii to the United States during the first ten months of 1942 were 674,958 tons. This was 137,500 tons less than the shipments from Hawaii in the same months in 1941. Most of this reduction, however, was in the several months immediately following the attack on Pearl Harbor by the Japanese. Throughout most of 1942, shipments were maintained at about normal volume. Labour shortages handicapped sugar production in Hawaii throughout the year. A large part of the 1942 crop in Cuba was converted to alcohol for the manufacture of smokeless powder. (*See* also BEE-KEEPING; MAPLE PRODUCTS; RATIONING; SYRUP, SORGO AND CANE.)

(S. O. R.)

U. S. Production of Beet Sugar by States, 1942 and 1941

State	1942 short tons	1941 short tons	State	1942 short tons	1941 short tons
California	358,000	313,000	Idaho	115,000	107,000
Colorado	334,000	299,000	Utah	81,000	82,000
Michigan	176,000	158,000	Wyoming	71,000	79,000
Montana	142,000	118,000	Ohio	56,000	46,000
Nebraska	115,000	121,000	Other states	216,000	161,000

Suicide Statistics.

Indications provided by the mortality experience of industrial policyholders of the Metropolitan Life Insurance company showed that the death rate from suicide in the United States in 1942 was about 10% less than in 1940. In the latter year, the last of complete record, 18,907 deaths from suicide were reported for the United States, the death rate being 14.4 per 100,000 population. The reduction in suicide mortality just noted is a situation commonly experienced during periods of war. Provisional records for England and Wales showed a drop of about 15% in the suicide death rate for males from 1939 to 1941. German data pointed to a decrease of about 30% in the suicide death rate over the same period. These decreases may be partly accounted for by a submergence of individual worries in the common national problems in time of war. Improved economic status resulting from intense industrial war activity may be another contributing factor.

An analysis of police records of suicides in 27 large American cities in 1941 showed the following distribution of methods used: asphyxiation, 21.2%; firearms, 20.4%; hanging, 19.0%; poison, 16.3%; drowning, 5.2%; cutting instruments, 4.5%; miscellaneous, 13.4%. In a total of 161 American cities surveyed, the death rate from suicide in 1941 was 14.2 per 100,000, while in 1940, it was 16.3. The corresponding figures for 11 cities in Canada were 7.8 per 100,000 in 1941 and 8.2 in 1940.

When deaths are allocated according to place of residence, it is found that suicide is most frequent in large communities and least frequent in rural areas. Thus, in 1940, cities of 100,000 and over in the United States had a suicide death rate of 16.8 per 100,000; cities of 10,000 to 100,000, a rate of 15.6; cities

Deaths from Suicide per 100,000 White Persons in the United States, 1940

State	Rate per 100,000	State	Rate per 100,000
United States	15.5	Montana	21.1
		Nebraska	16.8
Alabama	11.7	Nevada	41.3
Arizona	15.2	New Hampshire	16.3
Arkansas	8.0	New Jersey	16.9
California	27.2	New Mexico	11.2
Colorado	19.4	New York	17.2
Connecticut	17.9	North Carolina	10.4
Delaware	15.2	North Dakota	9.7
District of Columbia	25.9	Ohio	16.3
Florida	19.8	Oklahoma	8.7
Georgia	12.1	Oregon	16.9
Idaho	17.7	Pennsylvania	13.2
Illinois	15.0	Rhode Island	12.5
Indiana	17.3	South Carolina	9.7
Iowa	15.2	South Dakota	10.5
Kansas	13.0	Tennessee	10.0
Kentucky	10.3	Texas	13.6
Louisiana	12.4	Utah	12.2
Maine	15.7	Vermont	16.7
Maryland	18.0	Virginia	18.4
Massachusetts	13.3	Washington	22.7
Michigan	14.2	West Virginia	10.6
Minnesota	14.4	Wisconsin	15.2
Mississippi	10.1	Wyoming	23.5
Missouri	16.6		

of 2,500 to 10,000, a rate of 15.1; and rural areas, 12.0.

The white population of 5 states, all in the far west, and the District of Columbia had death rates of more than 20 per 100,000 in 1940; the states were Montana, Wyoming, Nevada, Washington, and California. On the other hand, rates of less than 10 per 100,000 for the white population were found in only four states, North Dakota, South Carolina, Arkansas, and Oklahoma. Suicide death rates for each state are shown in the table on p. 671.

The suicide death rate varies strikingly with race, sex and age. In the white population of the United States in 1940, the rate was 15.5 per 100,000; Negroes had a rate of only 4.0; Indians, 8.4; Chinese, 45.2; and Japanese, 26.0. Males, of all races combined, had a death rate of 21.9 per 100,000; females, 6.8. The death rate in the general population varied with age from 6.1 per 100,000 at ages 15 to 24 years, to 13.5 at ages 25 to 34, to 19.4 at ages 35 to 44, to 27.7 at ages 45 to 54, and then to about 33 at ages 55 and over.

During 1940, the peak month was April with a suicide rate of 16.2 per 100,000; the low points were 12.5 in January and 12.9 in November.

Sulphur.

The production of sulphur in the United States in 1941 increased by 15% over 1940, to 3,139,253 long tons, while shipments increased 33% to 3,401,410 tons. Stocks at the mines declined by 300,000 tons, to 3,900,000 tons, which is still more than a full year's supply. Imports in the first nine months of 1941 were 20,954 tons, mostly from Canada, and exports were 474,551 tons of crude and 24,683 tons of refined, a total of 499,234 tons, against 766,213 tons in 1940. Domestic consumption was estimated at 2,239,000 tons in 1941, an increase of 22%. Production during the first three quarters of 1942 was 2,667,087 tons, and shipments 2,584,062 tons; stocks had increased to 4,972,045 tons.

The Chilean production was 25,182 metric tons in 1941, and exports 21,719 tons, both declines from 1940. Specific information was lacking from other producing countries, of which Italy and Japan are the most important. (G. A. Ro.)

Sunday Schools.

The largest of the 51 national and international bodies which are federated in the World's Sunday School association was in 1942 the International Council of Religious Education, representing 48 Protestant denominations in the United States and Canada, and enrolling about one-half of the Sunday school scholars of the world. Because of war conditions, its 21st quadrennial convention was limited to one day, and held in Chicago, Feb. 10, 1942. A memorial service was held for Russell Colgate, president of the council since 1924, who had died on July 31, 1941. The president for the ensuing quadrennium was Governor Harold E. Stassen, of Minnesota. The convention inaugurated a "United Christian Education Advance," in accordance with a carefully planned program of interdenominational co-operation. In addition, the council developed special programs to meet the religious educational problems and needs created by the wartime dislocations of population. With the Federal Council of the Churches of Christ in America it participated in the work of the Christian Commission for Camp and Defense Communities, and was one of the sponsors of the Service Men's Christian league, a voluntary organization of men in military service.

In countries controlled by the axis powers, Sunday school work suffered because movements appealing to or seeking to organize Christian youth were increasingly suspect and for the most part banned. In Spain, Protestant schools were "provisionally suspended" with no likelihood of the suspension ending. Yet encouraging word concerning the maintenance of Sunday school work came from Czechoslovakia, Finland, Portugal, Sweden and Norway. In China the work of the National Committee for Christian Religious Education continued to be effective under hard conditions. (*See* also CHURCH MEMBERSHIP.)

Suñer, Ramón Serrano: *see* SERRANO SUÑER, RAMÓN.

Superphosphates.

The production of superphosphates in the United States in 1941 was 4,196,314 short tons of all grades, equivalent to 5,055,737 tons of 16% grade, the standard of the industry. This is an increase of 12% over 1940. The consumption of phosphate rock was approximately 2,860,000 tons, and of sulphuric acid 2,333,000 tons. Both production and shipments in the first three quarters of 1942 were considerably higher than in 1941. (G. A. Ro.)

Supreme Court of the United States.

Personnel.—At the end of 1942 the high bench comprised Chief Justice Harlan Fiske Stone and Associate Justices Owen J. Roberts, Hugo L. Black, Stanley Reed, Felix Frankfurter, William O. Douglas, Frank Murphy and Robert H. Jackson.

The latest appointee to the court in 1942, James F. Byrnes, resigned to become Director of Economic Stabilization, an office created by presidential order to carry out the purposes of the Amended Price Control act of Oct. 1942. In Jan. 1943 Wiley B. Rutledge was named to fill the vacancy.

The government's appeal in the anti-trust suit against the Aluminum Company of America and its affiliates was dismissed for want of a quorum of justices qualified to sit in the case: the Chief Justice, Mr. Justice Reed, Mr. Justice Murphy and Mr. Justice Jackson were unable to participate in the questions of the case on the merits.

The court convened on Dec. 21, 1942, to pay tribute to one of its most distinguished members, the late Louis D. Brandeis. In reviewing Justice Brandeis' active judicial service, which covered a period of 23 years from 1916 to 1939, Chief Justice Stone said:

> These bear internal evidence of the prodigious labour and painstaking care with which they were prepared. In cases involving the validity of legislation or the application of statute or common law to new fact situations, his opinions, like his briefs at the bar, give us the results of his extensive researches into the social and economic backgrounds of the questions presented, buttressed by expert opinion and accounts of the experience in other states and countries. His statements of fact and law were simple, direct, orderly, powerful, proceeding to their conclusion with convincing logic. In their discussions of the principles of constitutional freedom and of civil liberty they rise to heights of dignity and power which place them among the great examples of legal literature. He was never willing to sacrifice clarity to the turn of a phrase, for he wished above all to be understood. For laymen as well as lawyers his opinions are a compendium of legal aspects of the social and economic phenomena of our times. Together they constitute one of the most important chapters of the history of this court.

Issues.—The court met in extraordinary session to hear the petition of the German saboteurs on July 29, and in an opinion which safeguards all the freedoms of a democratic state confirmed the authority of a military tribunal which eventually condemned six to death and the remaining two to life imprisonment.

The supreme court considered the limits of governmental authority as between federal and state governments, the right of individuals in relationship to government control, and the interpretation and application of federal legislation. In one of its most significant decisions it has ruled that when federal laws have pre-empted the field, a state may not enact conflicting legislation. Accordingly an Alabama statute was invalidated which authorized inspection and condemnation of packing stock butter transported into the state as raw material used in the manufacture of processed or renovated butter intended for shipment in interstate commerce (*Cloverleaf Butter Co.* v. *Patterson*). On the other hand, mere passage of the National Labor Relations act was held not to have impaired the sovereignty of the several states in regard to regulating such union activities as mass picketing threatening employees, picketing their domicile, and obstructing plant entrances and free use of public streets. (*Allen-Bradley Local No. 1111* v. *Wisconsin Employment Relations Board.*)

Civil rights were again championed by the supreme court when it reversed a conviction for contempt of court arising out of a newspaper publication of a telegram denouncing a court decision and the publication of certain editorials admonishing a judge to deny probation in a pending case. It declared unconstitutional a statute requiring sterilization for habitual criminals when that class was arbitrarily designated, and struck down a Georgia statute providing that any person who contracts to perform services with intention not to perform, as calling for involuntary servitude. (*See* LAW.)

In the realm of labour, out of 60 cases 20 were reversed by the court. The principles set forth included restriction of labour's right to picket even though peaceful; the definition of the scope of employees' right to freedom of speech under the Wagner act; application of minimum wage and maximum hour provisions of the Fair Labor Standards act to various wage payment plans; computation of regular pay where employees work irregular hours for a fixed weekly wage by dividing his weekly wage by his weekly hours of labour; applicability of the act to service employees employed by the owner of loft buildings leased to manufacturers of goods for interstate commerce; the right of an employer to fix by contract with his employees the regular rate of pay for the purpose of computing overtime; lack of authority of the Wage-Hours administrator to delegate power to sign and issue a *subpoena duces tecum* (for production of records); and the inapplicability of the Norris-La Guardia Anti-Injunction act to controversies in which the employee-employer relation has no bearing.

Statistics.—At the supreme court's 1941–42 term decisions of courts below were affirmed in 40% of the cases decided by opinion. Seventy cases were affirmed; 85 reversed and 2 modified. A total number of 162 majority opinions were announced by the supreme court during the 1941–42 term, disposing of 174 cases. This was four fewer opinions than announced at the 1940–41 term. The number included opinions in several cases reargued at the 1941–42 term due to the failure of the court to dispose of them at the preceding term because of an equal division of the court. The total number of cases on the Appellate docket, 1,290, was larger than for many terms.

In contrast with the preceding term in which there were only two instances of a 5-to-4 division of the court, and three instances of a 4-to-3 division by an eight-Justice bench, the court at its 1941–42 term divided 5-to-4 in deciding 18 cases disposed of by 16 majority opinions. In three of the 16 instances, the minority was composed of Chief Justice Stone and Associate Justices Roberts, Frankfurter and Byrnes. In four instances, Associate Justices Black, Reed, Douglas and Murphy dissented from the five-vote majority opinion. Three of the instances involved labour law.

In the 16 instances in which there was a four-member dissent from the majority opinion, Associate Justices Black and Douglas were together in 10 instances, and Mr. Justice Murphy joined with them in seven of these. On the other hand, the Chief Justice and Associate Justices Frankfurter and Byrnes joined together five times in dissenting with another member of the court from a decision rendered by a majority of five. In one instance, Chief Justice Stone joined with Associate Justices Black, Douglas and Murphy to cause a 5-to-4 division of the court.

Number of Opinions, U.S. Supreme Court, 1941-42 Term

	Favourable to Government	*Against Government*
Federal tax cases	14	7
Federal labour cases	9	4
Federal regulation cases (other than labour)	15	7
Federal criminal cases	6	4
Federal miscellaneous cases	9	4
Total	53	26
State tax cases	7	2
State regulation cases	6	5
State criminal cases	3	3
State miscellaneous cases	2	3
Total	18	13
Total federal and state government cases (110)	71	39

A statistical summary of the court's work indicates:

Original Docket: Total cases 12; cases disposed of 2; cases remaining 10.

Appellate Docket: Total cases 1,290; cases disposed of 1,166; cases remaining 124.

Totals: Total cases 1,302; cases disposed of 1,168; cases remaining 134.

Distribution of cases disposed of during term: Original cases 2; Appellate cases on merits 381; Petitions for certiorari 785.

Cases Remaining on Dockets: Original cases 10, Appellate cases on merits 65; Petitions for certiorari 59.

Hearings Granted: Petitioners for certiorari granted 166; question of jurisdiction noted or postponed 34; petitions for rehearing granted 11.

(*See* also CIVIL LIBERTIES; LAW.) (B. WE.)

Surgery.

Although the value of blood transfusion had been known for some time, the importance of the use of blood plasma, blood albumin, and other blood substitutes in the treatment of shock has recently been emphasized. Plasma and albumin have the distinct advantage over whole blood in that no matching is necessary. Plasma and albumin are as efficacious as whole blood in combating shock and also can be greatly concentrated so that relatively small amounts have the same effects as much larger amounts of blood; in fact concentrated albumin has been prepared so that 25 cc. is equivalent to 500 cc. of whole blood.

Burns were treated in a variety of ways but it was fairly generally agreed that they should be treated as potentially infected wounds. In other potentially infected (contaminated) wounds the removal of the injured tissues, dirt and other foreign bodies results in prompt healing. Also in burns careful cleansing of the burned area with soap and water as soon as possible and the application of a compression bandage resulted in rapid healing. Shock which is likely to occur in burns because of the loss of albuminous material in the secretion from the burned surface could be prevented and treated by the administration of plasma.

The control of infections continued to be of paramount importance. Whereas sulphonamides were extremely valuable in surgical infections before the occurrence of actual pus formation, they were less efficacious after there had been destruction of tissue. In many staphylococcic (pus producing) infections resistant to sulphonamide drugs the use of penicillin, a substance derived from the growth of a mould, offered considerable promise. This substance is effective even in the presence of destroyed tissue and pus.

Sudden death from embolism (clot in the lung) resulting from the detachment of a clot in a vein usually in a lower extremity could be prevented. By introducing in a vein a substance which would produce a shadow on an X-ray film, it was possible to visualize the clot and then tie the vein above it so that it could not get loose to get to the heart and lung. Milk leg and its sequelae, such as persistent swelling of the extremity, could be satisfactorily treated by producing local anaesthesia of the nerves which are responsible for the symptoms.

Whereas cancer of the prostate gland had previously been extremely difficult to treat, it was shown that even in advanced cases removal of the testicles results in regression of the tumor. (*See* also ANAESTHESIA; MEDICINE.)

Surinam (DUTCH GUIANA). A Netherlands colony in northeastern South America. Area, 55,143 sq.mi.; pop. (Dec. 31, 1941, official est.): 183,730, including an estimated 2,616 Indians and 19,032 bush Negroes. East Indians (49,300 British and 34,563 Netherlands East Indians) made up a greater proportion of the population than in any other American area. The chief cities are Paramaribo, the capital (pop. 54,853), and Nieuw Nickerie (3,788). Government is in the hands of an appointed governor and a partially elected council. The governor in 1942 was Dr. J. C. Kielstra.

History.—The effects of World War II on Surinam continued to be mixed during 1942. Normal trade channels were even more disturbed than before, owing to axis submarine activity in Atlantic and Caribbean waters, but booming bauxite exports (*see* below) and the presence of United States troops protecting the colony provided an economic stimulus.

Politically, the most important event was Queen Wilhelmina's Dec. 6 pledge of postwar "equal partnership" of Netherlands overseas territories with the metropolis, which was interpreted to mean practically complete local autonomy.

Of interest as a possible portent of the future was the arrival in late December of 122 Netherlands refugees intending to settle in Surinam.

Education.—There were four secondary and 114 elementary schools (including 44 public) in 1942, with around 21,500 enrolment, over half in Paramaribo. In addition there were 33 bush Negro and Indian schools in the interior.

Finance.—The monetary unit is the guilder (value in 1942, approx. 53 cents U.S.). Until 1941 the colony's budget showed a constant deficit (1939, 2,915,503 guilders), made up by the home government. In 1941, however, expenditures were 6,927,552 guilders, leaving a surplus of 1,090 guilders, and were estimated at 8,628,515 guilders in 1942, with income calculated at 8,643,417 guilders.

Resources and Trade.—The colony is practically undeveloped except along the coastal plain, which includes 150 sq.mi. devoted to agriculture and the bauxite deposits. Bauxite, first developed in 1922, was the chief export commodity in 1942. In 1941, bauxite export totalled 1,093,764 tons, all but equal to the combined 1939 and 1940 totals. Practically all bauxite exports were taken by the United States. Gold was the second export in value. Its production was not reported in 1942, but it normally approximates over 400,000 grams.

Exports in 1941 aggregated 11,398,377 guilders' value (93.4% to the United States, 4.2% to Great Britain). Imports were valued at 9,429,922 guilders, with the United States supplying 71.9% (1940, 57.5%; 1939, 30%), Trinidad, 5.4%, Argentina 4.6%, Great Britain 4.2%. Imports are largely manufactured goods and foodstuffs.

Agricultural exports include sugar (1941, 9,390 tons), coffee (1941, 17,763 bags of 132 lb.) and rice (1941, 1,520 tons), along with maize, oranges, molasses and rum.

Balata (1941, 275 tons) is the most important product of the interior forests.

Communication.—External communication is by steamship and air. There were 13 km. of railway in 1942 and fairly good roads along the coast. Interior communication is entirely by trails and navigable rivers.

BIBLIOGRAPHY.—Netherlands Information Bureau, *Netherlands News*; J. K. Wright and William van Royen, *The Netherlands West Indies: Curaçao and Surinam* (1941); J. W. Nystrom, *Surinam: a Geographic Study* (*c.* 1942).

Sutherland, George (1862–1942), U.S. jurist, who held the distinction of being the strictest "constitutionalist" in the supreme court during his 16-year tenure, was born March 25 in Stony Stratford, Buckinghamshire, England. When he was a year old his parents emigrated to Utah, where he attended school. After studying law at the University of Michigan, he returned to Utah to practise. By the time Utah gained statehood in 1896, he swiftly climbed to political leadership. In 1905, he became U.S. senator from Utah, serving two terms until 1917. In 1920, he helped manage the Republican presidential campaign for Warren G. Harding, and he was rewarded two years later with an appointment to the U.S. supreme court as associate justice. On the bench Sutherland was a stanch conservative. The constitution was his guidepost at all times, and his dissenting opinions against New Deal legislation frequently asserted that the laws under consideration were unconstitutional. Justice Sutherland, who retired from the bench in Jan. 1938, died of a heart attack in Stockbridge, Mass., July 18.

Swaziland: *see* BRITISH SOUTH AFRICAN PROTECTORATES.

Sweden. A democratic monarchy of northern Europe. Area, 173,347 sq.mi.; pop. (Dec. 31, 1941) 6,406,474. Capital, Stockholm (est. Dec. 31, 1942, 613,000). Other principal cities are Göteborg (Gothenburg, est. 1940, 281,302), Malmö (155,465), Norrköping (70,835), Hälsingborg (62,310). Religion, Lutheran Christian. Ruler in 1942: King Gustavus V (*q.v.*); prime minister: Per Albin Hansson.

History.—Despite all efforts directed toward neutrality, the war impinged on the Swedes in innumerable ways during 1942. Bombs struck Haparanda, and several Swedish ships were sunk in the Baltic. Both German and British planes occasionally violated Sweden's neutral air, and some crashed inside the country. Nine members of a German sabotage gang were sentenced in February, and later groups of Czechs and British were convicted of espionage. Ships were lost in the Atlantic and even in the Mediterranean, where they had gone to take Canadian wheat to the starving Greeks. Arrangements had been made earlier in the war for "safe-conduct ships" sailing under the permission of both Germans and British. During 1942 the activity of these ships increased, but the traffic was still both dangerous and insufficient.

Newspapers could not be suppressed under Swedish law, yet control there had to be when publicized sentiments might get the nation in trouble. Individual issues of many papers were therefore confiscated for such things as printing atrocity stories from Norway. H. A. Möllman-Palmgren, nazi editor of *Sverige Fritt* (*Free Sweden*) was sentenced to six months' imprisonment, the paper was banned from the mails and agents were forbidden to sell it—fairly effective suppression. Yet the press as a whole showed independence in criticizing brutality and injustice whether in Norway or in Czechoslovakia, and clearly indicated the humanitarian sympathies and the liberal-democratic ideals of the Swedish people.

Positive accomplishments were manifold, partly natural, partly stimulated by the war. Swedes extended more than $4,500,000 of aid to Norway, carried food to the Greeks and conducted relief operations in Belgium and the Netherlands. About 9,000 refugees, 6,000 of them from Norway, found haven in Sweden, not counting some 25,000 Finnish children cared for. The completion of the Sandö bridge in the northeast eliminated the last road ferry between Stockholm and Haparanda on the Finnish border. Railroad electrification was achieved for the route from Trälleborg in the south to Riksgränsen in the northwest. Swedish inventive and productive genius made synthetic rubber from wood, doubled the production of cellulose fodder, increased milk production 8%, and increased production of edible oil plants to provide 10% of the nation's margarine requirements. Arrangements were made for a postwar air line direct to the United States. For the Swedes one of the most encouraging items was the rapid upswing in the birth rate, accompanied by a record number of marriages.

The city and county elections of September were significant examples of free politics within a regimented Europe. No fundamental change was recorded, but in percentage of votes cast the Social Democrats dropped (as compared with 1938) from 53.8% to 50.7% and the Conservatives from 18% to 17.4%. The Farmers party increased from 12% to 13.3% and the Liberals from 12% to 12.5%. The Socialists, now pro-nazi, lost all five of their seats on both city and county councils, and the Communists gained 16 for a total of 42—out of 1,520 altogether. The Socialists and Communists together increased their vote from 4.1% to 6.1%.

During 1942 the export of iron ore to Germany was reduced to slightly more than 8,000,000 tons, and the total trade turnover with Germany to 1,750,000,000 kr. (from 1,912,000,000 kr. in 1941). In negotiations in November and December the Swedes refused to grant further German credits, which in 1942 totalled 115,000,000 kr. German products reached Sweden satisfactorily in 1942 except for the much-needed coal and coke, which to December amounted to 3,800,000 tons out of a promised 5,700,000. Sweden refused to join the German-proposed European postal union.

Education.—In 1937–38 there were 567,579 pupils and 27,858 teachers in the elementary schools and 90,087 students in secondary schools. In the five universities, 7,606 students were enrolled in 1940. Sweden's budget for educational expenses in 1941–42 was 256,387,000 kr.

Defense.—Figures on defense were not complete after the outbreak of World War II. Prior to Sept. 1939 the following facts were valid: All men 20–45 were liable to conscription. The infantry consisted of 20 regiments and 1 corps; cavalry of 4 regiments; artillery of 7 regiments; the *Train* of 4 corps and the *Intendance* of 3 companies. The navy took about 5,000 annual conscripts and had a permanent body of about 5,500. New naval statistics published in Dec. 1942 showed that Sweden had 23 destroyers, with 6 more building; 27 submarines and 1 building; 1 new mine-carrying cruiser soon to be ready; plus the earlier 8 coast-defense vessels and at least 21 torpedo boats. The air force had not in 1938 reached its quota of 255 officers, 175 noncommissioned officers and 1,015 enlisted men. At the end of 1941, 16 squadrons were being planned. Total estimated expenditure for defense in 1942–43 was 2,700,000,000 kr., as compared with an average expenditure in the years 1931–35 of 122,601,600 kr.

Finance and Banking.—The monetary unit is the krona (26 U.S. cents at par, 23.94 cents on Nov. 8, 1941). The fiscal year ending in June 1942 left a government deficit of 2,205,000,000 kr. National income is about 12,000,000,000 kr., of which about 5,000,000,000 kr. go into state and municipal taxes. The national debt Dec. 1, 1942, was 8,041,000,000 kr., nearly double that of two years earlier. In 1940 there were 28 private banks with deposits of 4,793,477,000 kr. Gold reserves in Dec. 1942 reached an all-time record of 1,404,000,000 kr. ($351,000,000).

The budget presented to the riksdag by the king in Jan. 1943 asked for total expenditures of 4,131,000,000 kr., 48% of which is for defense: 1,985,000,000 kr. The defense item was slightly lower than for 1942, the total budget about 160,000,000 kr. higher.

Trade.—In 1942 (first 11 months) exports were valued at 1,191,000,000 kr. (drop of 41,000,000 from same period in 1941). Imports were 1,610,000,000 kr., an increase of 93,000,000 kr. Value comparisons were difficult because of rising prices.

The chief articles of export in 1939 were paper and manufactures (500,466,638 kr.), iron and steel (269,741,501 kr.), iron ore (231,840,366 kr.), wood and wood products (215,286,956 kr.), nonelectrical machinery (114,812,455 kr.). Chief articles of import were coal and coke (260,801,838 kr.), nonelectrical machinery (225,159,463 kr.), iron and steel (219,410,306 kr.), vehicles and parts (140,920,390 kr.), mineral oils (134,339,796 kr.), electrical machinery (93,068,552 kr.). Exports went chiefly to Great Britain, Germany, the United States and Norway. These countries, plus Belgium and the Netherlands, supplied most of Sweden's imports.

Communication.—On Dec. 31, 1940, there were 10,231 mi. of railroads, of which (by 1942) 3,000 mi. were electrified. In 1939 there were 53,787 mi. of highways, practically all listed as "improved." Motor vehicles licensed (Dec. 1940) numbered 81,334. Airways (1939) flew 1,536,000 mi. and carried 60,000 passengers. Telephones (Dec. 31, 1941) numbered 980,000 (about 150 per 1,000 people), putting Sweden second only to the U.S. in the per capita ratio of telephones. Telegraph mileage was 11,040. There were 1,470,375 licensed radio sets and 35 broadcasting stations.

The Swedish merchant marine consisted of 1,605,000 gross tons in 1938. The war had taken toll of 180 ships of 410,000 tons by Nov. 1942 but new building and purchase totalling 300,000 tons (166,000 tons launched in 1942) left a net loss of some 110,000 tons.

Agriculture.—In 1942 the bread-grain harvest, still 10% below normal, was almost double the 1941 crop. Fodder was 13% below normal, but provided for a 4,000,000-ton milk production, for cheese production at the existing rate and for a butter increase of 16% to about 95,000 tons. Egg production was about 60% of the 10-year average, and meat also about 60%. The potato harvest of 1942 was above normal, as were the sugar-beet and pea crops.

Manufacturing.—The total value of production in 1939 was 8,151,768,000 kr. There were 644,360 workers in 19,092 establishments. The chief manufactures were machinery and metal, 2,518,576,000 kr.; wood and paper, 1,489,655,000 kr.; foods, 1,395,787,000 kr.; clothing and textiles, 801,799,000 kr.; chemicals, 392,569,000 kr.; electrical equipment, 302,984,000 kr.; beverages, 230,845,000 kr.; stone, etc., 229,054,000 kr.; and leather, 228,717,000 kr.

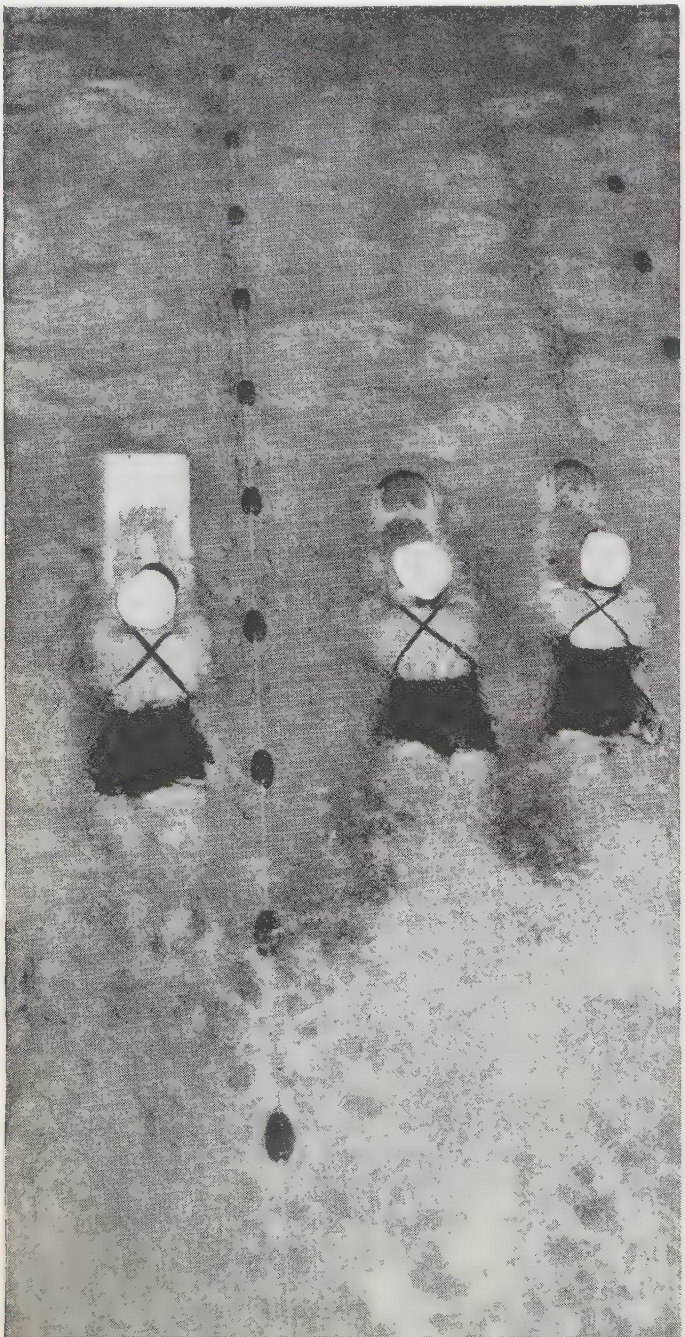
Mineral Production.—Production of the leading minerals in 1939 was as follows: iron ore, 15,197,633 tons; iron and steel, 1,300,900 tons; cast iron, 709,923 tons; coal, 489,085 tons; arsenic ore, 267,065 tons; sulphur pyrites, 211,352 tons; fireclay, 153,168 tons. Silver production amounted to 7,226,855 oz.; gold, 2,149,220 oz. (F. D. S.)

Sweet Potatoes: *see* POTATOES.

Swimming. Strangely, war served as a great stimulus to swimming in 1942. Universal realization of the vital importance of watermanship to combat forces urged virtually all belligerent nations to provide systematic instruction for their fighting men. Literally millions were taught to swim, a large percentage gaining proficiency.

Competition was encouraged everywhere, too, and although most of the warring countries again cancelled their national championships for men, there was activity aplenty, with events for service men usually featured.

CODY'S KIDS, a swimming team of four Portland, Ore., high-school girls coached by Jack Cody, held all but one U.S. free-style championship in 1942. Three of them are shown here in kicking practice



World's records continued to fall. The greatest feat achieved was that of Ragnhilde Hveger of Denmark in breaking three of her own women's marks in a single 1,500 m. free-style swim. She slashed the time for the full route from 21 min. 45.7 sec. to 20 min. 57 sec. and on the way cut the marks for 800 m. from 11 min. 11.7 sec. to 11 min. 0.7 sec. and 1,000 m. from 14 min. 12.3 sec. to 13 min. 54.5 sec.

Swimmers of the United States bettered six listed universal records for men and equalled a seventh. The qualifying "listed" is used advisedly, as the F.I.N.A., in charge of the supervision of world's records, had not functioned for two years, so marks claimed were in abeyance, unapproved and unregistered.

William Smith, Jr., 17-year-old Hawaiian, clipped the free-style figures for 440 yds. from 4 min. 40.8 sec. to 4 min. 39.6 sec. and 880 yds. from 10 min. 7.6 sec. to 9 min. 54.6 sec., but he swam the 440 yds. in a 55-yd. bath, while the tabled mark was set in a 25-yd. pool. Allowing for the gain at the turns, Smith's time represents about 4 min. 29 sec. in the shorter pool.

Kiyoshi Nakama, another Hawaiian, lowered the figures for one mile from 20 min. 57.8 sec. to 20 min. 29 sec.; William Prew and Howard Johnson equalled those for 100 yards, 51 sec., and two varsity teams beat the time of 3 min. 31.3 sec. for the 400 yd. relay, a Yale four returning 3 min. 26.6 sec. and a Michigan quartet 3 min. 27.7 sec. Adolph Kiefer brought down the back stroke marks for 100 m. from 1 min. 4.8 sec. to 1 min. 2.8 sec. and 150 yds., from 1 min. 32.7 sec. to 1 min. 30.5 sec.

Maria Lenk, of Brazil, holder of world's breast stroke records, who invaded the United States with a team of South American champions late in 1941, prolonged her visit into 1942 and defeated all comers in contest. She fell short of her best work, but broke several national marks, among others dropping the time for 220 yds. from 3 min. 7.8 sec. to 3 min. 5.8 sec.

(L. DE B. H.)

Switzerland, a republican confederation of 22 cantons of west-central Europe, bounded N. and E. by Germany, S. by Italy and W. by France. Flag, white cross on red background. Area 15,944 sq.mi.; pop. (est. 1942) 4,300,000. Chief towns: Berne (cap. 123,000), Zürich (334,000), Basle (163,000), Geneva (124,000), Lausanne (90,000). Languages (census 1930): German 2,924,314; French 831,100; Italian 242,034; Romansch 44,204 and others 24,797. President (Jan. 1, 1943) Dr. Enrico Celio.

History.—Switzerland was still able in 1942 to maintain her position as a haven of comparative peace and security in the midst of a war-torn Europe. But the difficulties of her position increased with the spread of the war. The German press frequently warned that the Swiss press must take a more friendly attitude toward nazi Germany. On the other hand, British planes frequently flying over Switzerland to bomb Turin, Genoa and other Italian centres, technically infringed Swiss neutrality, but the Swiss could do nothing about it except make protests.

After the United States and many other American states went to war with the axis powers in the winter of 1941–42, the Swiss government consented to assume the burden of looking after their diplomatic interests, in addition to representing numerous other countries already at war. Switzerland also became the great centre for the work of the Red Cross in arranging the exchange of prisoners, securing the mutual unshackling of British and German prisoners in Dec. 1942, forwarding letters and packages to internees, and securing information about soldiers reported missing.

Education.—Managed locally by the cantons and communities, education is obligatory and free. In 1939–40 the pupils in primary schools numbered 455,561, and those in secondary and middle schools 73,422, in addition to various cantonal and technical schools. The seven universities (Basle, Zürich, Berne, Geneva, Lausanne, Fribourg and Neuchâtel) had a total of 9,649 matriculated students in the winter of 1940–41.

Defense.—In the national citizen militia service is compulsory and universal, except in the case of those who are physically unfit and who pay instead certain taxes. Liability to service extends from the 18th to the 60th year of age. At the outbreak of World War II in 1939 the whole Swiss army was mobilized with a force of 650,000 men. Subsequently some of the older classes were demobilized so that in 1942 less than 500,000 were under arms. The air force in 1942 consisted of 21 squadrons with 200 planes. Military expenditure in 1941 was 1,050,000,000 francs.

Finance.—The franc, the Swiss monetary unit, was devalued about 30% in 1936, so that it contained about 200 mg. of fine gold and had in 1942 an exchange value of 23.40 U.S. cents. The budget estimates for 1941 were 517,700,000 francs of revenue, and 592,300,000 francs of expenditure, and the total debt, including railway debt, was 6,130,656,000 francs.

Trade and Communications.—Imports and exports in 1941 were 2,024,000,000 francs and 1,463,000,000 francs respectively. Swiss railways, 3,218 mi. in length, carried 23,300,000 metric tons of freight and 144,000,000 passengers. There were, in 1942, three main and three local broadcasting stations. (S. B. F.)

Syphilis: *see* MEDICINE; VENEREAL DISEASES.

Syria, an independent republic, formerly French mandated territory, bordering the eastern Mediterranean. Area, 73,587 sq.mi.; pop. (est.) 2,800,000; chief town: Damascus (cap. 225,000). President (1942): Sheik Taj-ed-Dine-el-Hassani. Language: Arabic; religion: mainly Mohammedan.

History.—The government, which included representatives of various communities, was directed by French advisers.

New textile and footwear industries started production during 1942 and a paper industry was projected. Book publishing was started with the publication of school books.

Unemployment was practically non-existent, thousands being employed on the building of roads, railways, aerodromes and fortifications for which as much as ten times prewar daily wages were paid. Hoarding continued to cause a wheat shortage, and controlled distribution of large quantities of wheat replaced former methods of flooding the grain market in an attempt to reduce prices. Nevertheless, the price of bread remained high. American Red Cross flour was distributed in some districts by army authorities.

The following statistics refer to Syria and Lebanon jointly:

Finance.—Monetary unit, the Syrian pound (divided into 100 piastres). Revenue 1938 (at the rate of 20 francs = one Syrian pound) 588,787,596 francs. Expenditure 509,085,433 francs. Notes in circulation (June 30, 1939) £ Syrian 35,600,000; reserves (June 30, 1939), gold £ Syrian 3,500,000; foreign assets £ Syrian 31,800,000.

Trade and Communication.—Imports (1940) £ Syrian 57,000,000; (1941) £ Syrian 38,000,000; exports (1940) £ Syrian 19,000,000; (1941) £ Syrian 11,000,000. Roads (1939) *c.* 1,900 mi.; railways (1939) 890 mi.

Agriculture.—(1940) metric tons: wheat 669,500; barley 385,000; maize (1938) 27,500; oats (1939) 5,400; potatoes (1938) 41,600; tobacco (1938) 3,400; wine (1938) 43,000 hectolitres; cotton 6,500; cotton-seed 15,100; sesamum (1938) 5,300; olive oil 13,000; wool (1938) 9,900; raw silk 200.

Syrup, Sorgo and Cane. Sugar-cane syrup produced in the United States in 1942 was estimated by the department of agriculture at 18,610,000 gal. from 119,000 ac., with a yield of 156.4 gal. per ac. The ten-year (1930–39) average was 20,774,000 gal. from 135,000 ac. at 153.5 gal. per ac

Table I.—*U.S. Production of Cane Syrup by States, 1942 and 1941*

State	1942 gal.	1941 gal.	State	1942 gal.	1941 gal.
Louisiana	5,760,000	6,240,000	Florida	1,760,000	1,600,000
Georgia	3,900,000	3,564,000	Texas	665,000	840,000
Mississippi	3,300,000	3,135,000	South Carolina	485,000	500,000
Alabama	2,645,000	2,760,000	Arkansas	95,000	125,000

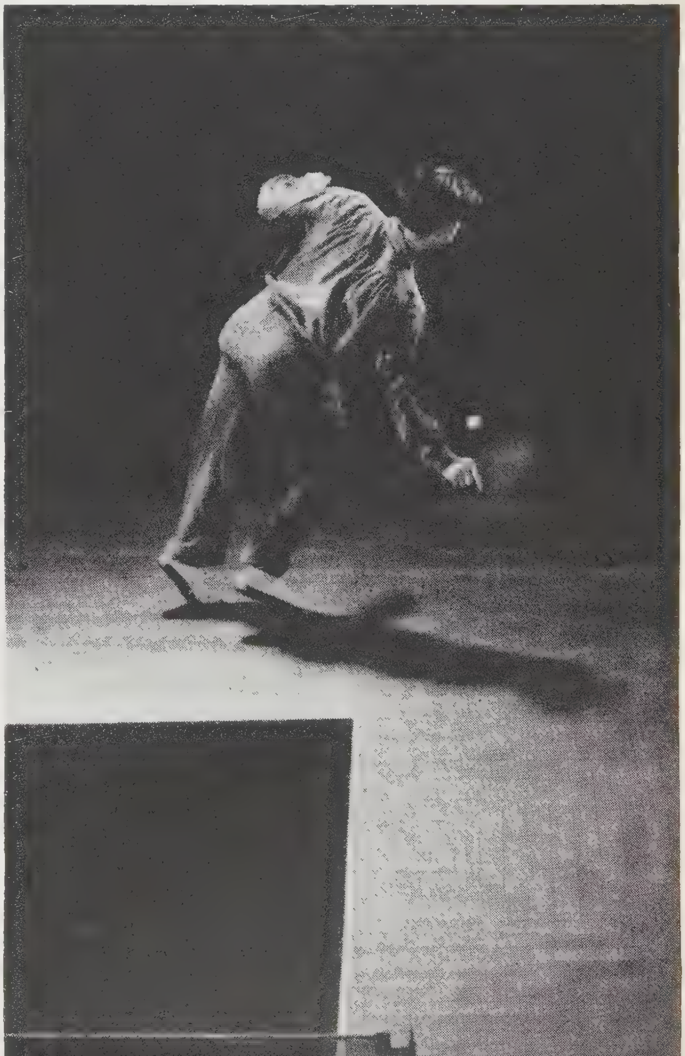
Table II.—*U.S. Production of Sorgo Syrup in Leading States, 1942 and 1941*

State	1942 gal.	1941 gal.	State	1942 gal	1941 gal.
Mississippi	1,800,000	2,150,000	Arkansas	1,155,000	800,000
Alabama	1,767,000	2,040,000	Tennessee	1,134,000	944,000
Georgia	1,220,000	714,000	North Carolina	1,065,000	522,000

Production of sorgo syrup in the United States was 13,674,000 gal. from 220,000 ac. at a yield of 62.2 gal. per ac. (*See* also BEE-KEEPING; MAPLE PRODUCTS.) (S O. R.)

Table Tennis. Few sports suffered as severely from the war as organized table tennis, the "most international game." In 1942, for the third straight year, the world

LOUIS PAGLIARO, shown here returning a shot without looking and with his back to the table, again won the U.S. table tennis singles championship in 1942, at Detroit



championship matches sponsored by the International Table Tennis federation were cancelled. The war also retarded growth of the game by causing shortages of materials, such as rubber for rackets and plywood for tables. After 1939 the U.S.A. was fast becoming the centre of formal play and was due to be the host for a return visit of the Japanese team, but these plans went up in the smoke of Pearl Harbor. Table tennis went to war: from Australia to Germany it became the most popular indoor recreation at military posts, and in civilian championship play the proceeds were given to the Red Cross and similar organizations. In the U.S., Louis Pagliaro and Sally Green again established a record by winning the men's and women's national singles titles for the third successive year. Because of travel restrictions the U.S. Table Tennis association placed greater emphasis on local and sectional tournaments for 1943. (C. Z.)

Talbot, Arthur Newell (1857–1942), U.S. engineer, was born Oct. 21 in Cortland, Ill. After receiving a degree in 1885 from the University of Illinois, he joined the university staff. Dr. Talbot, who retired from the faculty in 1926, made important contributions in the fields of reinforced concrete, hydraulics, water purification, sewage treatment and railroad track stresses. His investigations in the latter field led to the right-of-way system for high-speed trains. He was one of the founders of the University of Illinois experimental school in engineering. Dr. Talbot died in Chicago, April 3.

Talc. The record output of 281,375 short tons of talc and related minerals produced in the United States in 1940 was surpassed by 48% in 1941, when a total of 416,369 tons was reached. The bulk of this total was ground talc, but the tonnage of crude talc and of sawed talc both more than doubled, as a result of war demand. Imports declined and exports increased. The largest increases in use were in the paint, ceramics and rubber industries. Production also increased heavily in Canada and India. Little was known of conditions among the smaller producers. (G. A. Ro.)

Tanks, Military: *see* Munitions of War; World War II.

Tariffs. Tariffs were of trifling significance in 1942. In most countries and for most commodities the struggle was to obtain supplies and to facilitate their entry. There were reductions, suspensions and repeals of duties for importations of military supplies, to hold down the cost of living, or to aid the development of manufacturing industries in agricultural countries. Few of these changes were of permanent commercial significance. There were scattered increases of duties to supply revenue, or to favour domestic industries, but rather as assurance for the future than because foreign supplies were currently competing. There were, to be sure, great surpluses of certain commodities in various countries, but the shortage of shipping was such that they could move only to the extent to which they were regarded as indispensable elsewhere. In general, products could now be shipped from one country to another only after the grant of an export permit, an import permit and a shipping priority. Products which could clear these hurdles were not likely to be stopped by tariffs.

The process of commercial negotiations between governments had not wholly ceased, but most of the negotiations of 1942 related to arrangements primarily conditioned by the war and even if they touched on tariffs, as a few of them did, they had little or no enduring significance. The United States afforded the chief exception to this statement. It continued its trade agreement program, making agreements with Peru, Uruguay and Mexico. These agreements became effective respectively on July 29, 1942, and on Jan. 1 and Jan. 30, 1943. Of these agreements, naturally, that with Mexico affected the greatest amount of trade. The United States reduced duties on more than half of the dutiable imports from Mexico, and Mexico reduced duties on a somewhat greater value of imports, on the basis of the trade of 1939. The general import duty on sugar was halved in the agreement with Peru, making it only 18 cents per 100 lb. above the preferential rate on Cuban sugar. This reduction might become significant in the future. On a different tack, by an exchange of notes on March 2, 1942, the United States allowed Ecuador to impose higher duties on a list of products whose rates had been previously bound; and in February it permitted Haiti to grant discriminatory concessions to Santo Domingo.

During 1942 the interest in tariffs centred on the possibility of significant postwar developments. The United Nations gave general approval to the Atlantic Charter and a beginning was made in reducing the aspirations of that document to concrete terms. On Feb. 23 the Mutual Aid or Lend-Lease agreement between the United States and the United Kingdom provided that the settlement of the Lend-Lease obligations should be "such as not to burden commerce between the two countries, but to promote mutually advantageous economic relations between them and the betterment of world-wide economic relations." Agreement was to be sought "directed to the expansion, by appropriate international and domestic measures, of production, employment, and the exchange and consumption of goods, . . . to the elimination of all forms of discriminatory treatment in international commerce, and to the reduction of tariffs and other trade barriers. . . ." Similar agreements were made with many other of the United Nations. (*See* also International Trade.) (B. B. W.)

Tasmania. A state of the Australian commonwealth, forming an island 26,215 sq.mi. in area to the southeast of the mainland, from which it is separated by 140 mi. of Bass strait. Pop. (est. Dec. 1941) 241,171. Chief cities: Hobart (cap., 66,620); Launceston (33,250). Governor (1942): Sir Ernest Clark.

History.—The Labour government with R. Cosgrove as premier remained in office throughout 1942. Celebrations which had been planned before the war to mark the tercentenary of the discovery of Tasmania by Abel Tasman on Nov. 24, 1642, had to be abandoned. To commemorate the event, the Tasmanian government was to publish, in volume form, selections from Professor Heeves' translation of Tasman's journals.

For the fiscal year 1941–42 the state finances showed a balanced budget, revenue exceeding expenditure by £A1,585.

Education.—In 1939: state primary schools 420; average daily attendance 25,538; state high schools 5; average attendance 1,783.

Finance.—Revenue (1940–41), £A2,920,000; expenditure £A3,110,000; public debt (June 30, 1941), £A28,162,000.

Communication.—Dec. 31, 1939: roads, 9,350 mi.; railways: government, Dec. 1941, 642 mi.; private, 132 mi. Motor vehicles licensed (March 31, 1942): cars 14,134; trucks 5,422; cycles 2,314. Wireless receiving set licences (March 31, 1942) 46,037. Telephones (June 30, 1941) 19,565.

Industries.—Production 1939–40: primary £A8,185,110; secondary £A6,253,029. Labour 1940–41 average: factory employment, 15,839 employees; unemployment (March 1942) 0.7%. (W. D. Ma.)

Taxation. **United States.**—The Revenue Act of 1942, signed by President Roosevelt on Oct. 21—the heaviest tax-producing measure ever enacted—was notable not only for the taxes it imposed but for the various tendencies developed during the long consideration preceding its adoption. They included such devices as the Ruml plan to "forgive" all federal taxes of a chosen calendar year and credit tax payments made that year to the next year's assessments, so that the future federal tax collections of the United States would be established on a "pay-as-you-go" basis. Another proposal receiving widespread support, but defeated by treasury and administration opposition, was a general sales tax. The treasury, on the other hand, advanced a complicated compulsory savings plan, based on stiff taxes upon amounts spent by individuals, and also continued without success its advocacy of a federal tax on all issues of state and local securities, and a requirement for mandatory joint income tax returns by husbands and wives.

For seven months and seven days after the tentative tax bill was presented to the house ways and means committee by the treasury, the revenue-raising discussion commanded major attention throughout the nation. It ranked in public interest second only to the war developments. An avalanche of letters from current taxpayers and prospective taxpayers descended upon congress. The inevitable "broadening of the tax base" had at last made the electorate tax-conscious.

Total annual revenue of between $24,000,000,000 and $26,000,000,000, depending upon the size of the national income, was expected under the revised revenue laws of 1942. This would bring the grand total of taxes in the United States—federal, state and local—to approximately $36,000,000,000 a year, excluding social security taxes. Even this huge annual revenue was generally conceded to be inadequate to provide a sound basis of financing the government during the war period. The treasury announced it was preparing plans for further increasing of taxes by more than $6,000,000,000 a year. Congressional tax experts estimated the 1942 Revenue act would yield $9,700,000,000 a year in new taxes, of which $1,700,000,000 would be refundable after the war. Chairman George of the senate finance committee declared: "The bill approaches the maximum direct tax which can be levied on the taxpayers during the war, but it does not go very far in checking inflation." Senator George had been among those supporting a general sales tax, which was blocked by administration opposition but which remained a very live issue at the close of 1942.

"QUOTH THE RAVEN, 'WHY NOT ME?'" Congress continued to ignore the sales tax in 1942, as pointed out in this cartoon by Duffy of the Baltimore *Sun*

The Victory Tax.—The outstanding innovation of the 1942 Revenue act, a law that was expected to touch more citizens than any direct income tax ever enacted, was the Victory tax. This tax did not apply to 1942 income, but was to become effective on Jan. 1, 1943. The treasury estimated that approximately 50,000,000 persons would pay this tax for the year 1943. It was a flat tax of 5% on all income above $624 a year, regardless of whether the taxpayer is married or single, with a portion returnable. The 5% tax on wages and salaries was to be withheld by employers, except in the case of military or naval service, farm labour employment, household service or casual labour. An individual with income other than wages or salary would be required to file a special Victory tax return at the time for filing regular income tax returns. Income from dividends, interest, rents and other similar sources must be reported. Capital gains or interest from government bonds were exempted, and in the case of rents and some business transactions only net income was to be affected. This tax was distinct from and in addition to the regular income tax.

The act provides that the government shall return to the taxpayer after the war 25% of the Victory tax, up to $500, for single persons: 40%, up to $1,000, for married couples or head of a family, and an additional 2%, up to $100, for each dependent.

The taxpayer is given the option of accepting the deferred refund plan or of taking credits each year against the postwar refund. These credits may be taken as follows: (1) for amounts paid in premiums during the taxable year on life insurance in force on Sept. 1, 1942, on the life of the taxpayer, his spouse or dependents; (2) for reduction of individual indebtedness, computed upon the smallest amount of debt of the taxpayer outstanding at any time during the period beginning Sept. 1, 1942, and ending with the close of the preceding taxable year; (3) for net purchases of war bonds, the amount being determined by comparing the total bond holdings of the taxpayer at the end of the taxable year involved with the amount of bonds owned Dec. 31, 1942, or on the last day of any preceding taxable year ending after Dec. 31, 1942, whichever amount is the greater. The aggregate amount of such credits is limited by the amount of postwar refund to which the taxpayer may be eligible. (C. A. Sr.)

Individual Income Tax.—In the U.S. fiscal year 1942, the individual income tax accounted for $3,263,000,000 of the total revenue of $8,007,000,000 from federal income and excess profits tax collections. Income taxes produced $529,000,000, or 13.7%, of estimated total state tax revenues (exclusive of unemployment compensation taxes) during the fiscal year 1942.

For taxable years beginning in 1942, personal exemptions were reduced by the Revenue Act of 1942 from $750 to $500 for single persons and from $1,500 to $1,200 for married persons and heads of families. Members of the armed forces below the grade of commissioned officer were granted additional allowances, bringing their exemptions up to those of the preceding year. The credit for dependents was reduced from $400 to $350.

The normal tax rate was increased from 4% to 6%. The surtax rates were also increased, to range from 13% on the first $2,000 of surtax net income to 82% on surtax net income in excess of $200,000. Under the 1941 act they ranged from 6% to 77%, the latter applying to surtax net income over $5,000,000.

A significant innovation in the individual income tax was the deduction allowed for medical expenses. The allowance was limited to payments in excess of 5% of the taxpayer's net income, but could not exceed $2,500 where a joint return or head of a family return was filed or $1,250 in other cases. Numerous other changes were made to achieve greater equity and to improve the administration of the income tax.

Several important treasury recommendations were not included in the 1942 act (*see* above). The treasury recommended elimination of three "special privileges," namely, the tax exemption of interest from state and local securities, the use of separate returns by married couples, and the option of percentage depletion for mines and oil wells. These changes were not made. The treasury recommended that a portion of the regular individual income tax be collected at source from wages, salaries and dividends (the "pay-as-you-go" plan). The act as passed provided for collection at source of most of the Victory tax but not of the regular income tax. The treasury also recommended enactment of a tax to be levied at progressive rates on expenditures for consumers' goods and services in excess of personal exemptions of fixed amounts required for necessities and some comforts, and exempting personal savings. The spendings tax was not enacted.

It was estimated that more than 27,000,000 persons would pay a net income tax on 1942 incomes and that approximately 43,000,000 would be subject to the net income tax or the Victory tax on 1943 incomes. The final compilation of tax returns filed for 1940 revealed 14,710,771 individual income tax returns, including 7,437,307 taxable returns. Returns with net income reported net income of $36,300,000,000 and income tax liability of $1,400,000,000. Returns with net income of $5,000 and more accounted for 6% of the total number of returns, 24.5% of the reported net income and 92.8% of the tax liability. In the fiscal year 1942, collections from the individual income tax amounted to $3,300,000,000.

There were few significant developments during 1942 in state taxation of personal incomes. Rate changes were made in Massachusetts, Mississippi and New York.

Corporation Income and Excess Profits Taxes.—Although under the Revenue Act of 1942 the corporation normal tax rates were left unchanged at 24% for corporations with normal tax net income over $25,000, and at rates graduated from 15% to 19% for corporations with lesser amounts of such income, the surtax rates were increased to 10% for corporations with surtax net income not over $25,000, and to 16% for corporations with surtax net income over $50,000. Corporations with surtax net incomes over $25,000 but not over $50,000 were required to pay a surtax equal to the sum of $2,500 and 22% of the amount of the corporation surtax net income over $25,000. Previously the surtax rates were 6% on the first $25,000 of surtax net income and 7% on the balance.

In place of rates previously graduated from 35% to 60%, a flat excess profits tax rate of 90% was substituted, and profits which were subject to excess profits tax were not subject to income tax. However, the excess profits tax was limited to an amount which, when added to the income tax, was not to exceed 80% of surtax net income before deduction of the excess profits tax base. Furthermore, provision was made for a postwar refund equal to 10% of the excess profits tax imposed in each taxable year. In addition to these changes in excess profits tax rates, the invested capital credit was reduced to 8% on the first $5,000,000, 7% on the next $5,000,000, 6% on the next $190,000,000 and 5% on the balance. Unlike the 1941 treatment, the amount of excess profits left after the excess profits tax was not subject to the income tax.

Increased tax rates, however, were accompanied by other changes in the corporation income and excess profits tax structure which, in the case of many corporations, would at least partially offset the effect of higher tax rates. A few of these follow: A two-year carry-back of losses and unused excess profits credit was provided in addition to the two-year carry-forward of losses and unused credit previously allowed. Corporations making net repayments of debt might credit against excess profits taxes, an amount not to exceed 40% of the net debt repayment or 10% of excess profits taxes imposed in the year of repayment, with a corresponding reduction in the postwar credit for such year. The income from certain mining and timber operations under certain circumstances was granted full or partial exemption from excess profits taxes. Taxpayers using the average earnings credit in computing the excess profits tax were granted automatic relief for low income in one of the base period years, and taxpayers with abnormally low base period earnings were permitted to apply to a relief division to be set up within the tax court of the United States for a constructive earnings base.

Closely-affiliated corporations were granted the privilege of making consolidated income tax returns. Corporations making consolidated income tax returns were subjected to an additional tax of 2% on surtax net income.

Changes were also made in the treatment of capital gains and losses of individuals and corporations (*see* below), as well as in the income tax provisions relating to insurance companies, investment companies and U.S. corporations trading in the western hemisphere. The capital stock and declared value excess profits taxes were retained, but provision was made for the annual redeclaration of capital stock value.

Preliminary statistics of income tax returns for 1940 revealed 511,741 returns, of which 43,741 were for inactive corporations. Net income was reported in 220,980 returns and amounted to $11,200,000,000, and the income tax liability was $2,100,000,000.

There were no important developments during the year in state corporation income taxes. (*See* also BUDGETS, NATIONAL.)

(R. BL.)

Social Security Tax.—Over the protest of President Roosevelt, written in a letter to Chairman George of the senate finance committee, congress adopted an amendment to the Federal Insurance Contribution act (Internal Revenue Code, Sec. 1400), freezing the social security old-age benefit tax rate for another year at 2%, divided equally between employer and employee. Under the social security law the rate was scheduled to be doubled automatically on Jan. 1, 1943. Under the provisions of the amendment (sponsored by Senator Vandenberg, R., Mich.), the rate of 1% each on employer and employee would continue through 1943, increasing to 2% each on employer and employee for the years 1944 and 1945. Testimony introduced in the senate showed that at the rate prevailing in 1942 the social security tax was producing seven times the amount of revenue needed to pay current social security benefits. The action of congress was taken in the face of an administration-sponsored bill to increase social security taxes, liberalize benefits and to federalize unemployment insurance.

Capital Gains and Losses.—The 1941 law applicable to capital gains and losses was completely rewritten. Short-term and long-term gains and losses were redefined, short-term referring to assets held for not more than six months, and long-term being over six months. Short-term gains are taxable as ordinary income. Gains from capital assets held longer than six months are subject to a maximum tax rate of 25% instead of the regular income tax rate. Losses, either short- or long-term, may be used to offset gains, either short- or long-term. A net capital loss may be applied against other income up to a limit of $1,000. Losses may be carried forward for five years and offset against income to the extent of $1,000 a year.

Excise on Commodities and Services—Excise taxes were increased on many commodities and services. Typical changes were: distilled spirits, $6 per gallon compared with $4 under the 1941 law; beer, boosted from $6 to $7 per barrel; cigarettes, from $3.25 to $3.50 per 1,000; telegraph, cable and radio messages, from 10% to 15%; local telephone service, from 6% to 10%. The increases extended to lubricating oil, slot machines, cigars, photographic apparatus, transportation fares and admissions.

Estate and Gift Taxes.—There were no rate changes affecting estate and gift taxes, though the estate exemption was cut from an aggregate of $80,000 to $60,000, with the specific exemption of $40,000 for life insurance abolished. Regarding gifts, the cumulative lifetime exemptions were cut from $40,000 to $30,000.

Salary Limit Regulations.—Supplementing the 1942 tax law as a revenue producer was the exercise of extraordinary wartime power by the president, acting through Economic Stabilization Director Byrnes, to limit top salaries of business executives to a "basic amount" of $67,200 a year (estimated to yield a net of not more than $25,000 after taxes), and to freeze salaries of most other "white collar" workers at existing levels. Except for farm workers, regulations issued Dec. 2 by the treasury covered all salaries over $5,000 a year, and also those under $5,000 paid to unorganized executive, administrative and professional persons. Certain allowances to avert "undue hardships" in unusual cases were provided.

Great Britain.—Having already approached the maximum of revenue to be derived from direct taxation without resort to broad confiscatory measures, the British government in 1942 made comparatively slight changes in income tax regulations. In Great Britain, as in the United States, fiscal policies were dominated by the fear of disastrous inflation. The 1942 budget was essentially a sumptuary program intended not only to raise money but to check spending by the people. The budget was expected to produce about £2,400,000,000, of which amount approximately £150,000,000 would be provided through heavier duties on beer, spirits and tobacco. The postwar credit of 20% against the 100% excess profits tax on corporations remained in effect. The individual normal tax rate was 32½% for the first £165 (about $660) of taxable income, and 50% on the remainder. The surtax started after the income reached £2,000 ($8,000), the rates ranging from 10% to 47½%, which latter rate applied to income in excess of £20,000. Individual exemptions were £80 for a single person, £140 for married couples and £50 for each dependent. Aggregate income assessed for taxes in all classes in the 1942 fiscal year, according to the *Accountant,* was £4,250,000,000 and the tax paid amounted to £835,000,000, compared with £3,000,000,000 assessed and £310,000,000 collected in 1939. More than 10,500,000 persons paid taxes in 1942, compared with 3,800,000 in 1939, when the exemption limit of £250 prevailed. More than one-half of the taxpayers earned between £125 and £250 in 1942, and one-third were included in the wage span from £250 to £500. Despite the objective of the British government to meet 50% of wartime expenses by taxation, the revenue from this source covered only about 44% of total expenditures. Total revenue for the 1943 fiscal year was estimated at £6,934,000,000 and national expenditures at £15,648,000,000.

Canada.—"Pay as we go" was the fiscal slogan of the Ottawa government, and the fourth war budget, presented to parliament in June 1942 by Finance Minister Ilsley, carried the nation further toward that goal. Taxation in the fiscal year ending March 31, 1943, was expected to produce four times the revenue collected in Canada in the last prewar fiscal year ending March 31, 1939. The 1942–43 budget greatly increased income tax rates, and imposed compulsory savings, a straight 25% luxury tax on the purchase of almost every article classed as nonessential, and stiffer levies than heretofore on alcoholic beverages, tobacco, chewing gum, transportation fares, telegraph and cable messages, cameras, playing cards and private telephones. Under the new law, single persons in the $1,000 income level must pay $172 a year, with $80 refundable after the war. At the $2,500 income level, single persons pay $826 tax, with postwar refund of $200, while married couples with no dependents pay $651, of which $250 is refundable after the war. Married couples without children, earning $10,000 a year, pay a tax of $4,762, with a refund credit of $1,000. The refundable portion of the tax may be deducted from current taxes to the extent that it is offset by payments during the taxable year on account of life insurance premiums, principal payments on a mortgage, and pension fund payments. The balance, if any, would be refundable to the taxpayer after the war with 2% interest. The corporation excess profits tax was increased from 75% to 100%, with a provision that 20% of the tax collected on excess profits above a certain point would be refunded after the war. The minimum rate of tax on corporations in 1942 was 40% of profits. The new law was expected to produce about $700,000,000 in corporation taxes alone for the fiscal year ending March 31, 1943, compared with a total revenue of $85,000,000 from this source in 1939.

Australia.—Extensive changes were made in the Australian tax program outlined in Labour's budget of Oct. 29, 1942. Additional taxes of £22,000,000 Australian were imposed for the ensuing year. The new budget cancelled compulsory loans and gave relief to the middle-income taxpayers, who had borne a particularly heavy share of the burden. Increases in individual taxation were confined to incomes in excess of £1,500. The wartime company tax was increased more than fourfold, with a maximum of 78% on taxable profit exceeding 16%, and the ordinary company tax was increased from 2 to 3 shillings in the pound. An increased excise was placed on beer, tobacco and cigarettes, and the sales tax was boosted on a wide range of nonessential commodities.

New Zealand.—Faced with a war budget of £133,000,000, or nearly twice the total cost to the island government of World War I, New Zealand in 1942 continued to pay two-thirds of its war costs through taxation. Income was taxed at a flat rate of 5%, which was devoted to social security, and an additional 7½% for national security. Following these taxes, incomes of the equivalent of more than $1,000 were given exemptions of $250 for each dependent. After the exemptions were deducted and after the first 12½% of taxes, the tax increased by 1½% for each additional $500 of income until the income reached $12,000. Above that point a tax rate of 90% was applicable. (*See* also BUSINESS REVIEW; INITIATIVE AND REFERENDUM; LAW.)

(C. A. SR.)

Tea.

Sources of the tea supply of the United States in 1942 were limited to India and Ceylon. By agreement in the fall of 1942 between the U.S. government and the British food ministry, the latter was to buy the tea crops of India and Ceylon and throughout 1943 allocate the supply among the United States, Great Britain, Canada, Australia, the U.S.S.R. and South Africa. The Commodity Credit corporation, it was reported, was to buy that part allocated to the United States, to be distributed through regular trade channels. In 1940 and in 1941 the United States imported about 100,000,000 lb. of tea annually. Of this amount, 43,000,000 lb. was from India and Ceylon, 37,000,000 lb. from Java and Sumatra, 14,000,000 lb. from Japan and 6,000,000 lb. from China. With the occupation of Java and Sumatra by Japan the second largest of these sources was cut off from the United States. Under the allocation plan the United States was to receive 65,000,000 lb. of tea per year beginning April 1, 1943. Of this amount about 50,000,000 lb. was to go to civilian consumption; the remainder to the military. Tea consumption was reported to have increased substantially among U.S. troops in 1942, particularly those quartered in England, Ireland and North Africa. Tea consumption was reduced voluntarily in the United States by approximately one-third beginning in April 1942. The U.S. supply on hand Jan. 1, 1943, was reported to be sufficient for the first quarter of the year. (S. O. R.)

Tedder, Arthur William

(1890–), British air officer, was graduated from Magdalene college, Cambridge in 1912, and served with the royal flying corps in France during World War I. He attended the Royal Naval Staff college, 1923–24, headed the air armament school at Eastchurch and directed training at the air ministry. In 1936, he became air officer commanding the R.A.F. in the far east and in 1940, he was promoted to deputy commander in chief of the R.A.F. in the middle east. The next year he was made commander in chief of the middle east R.A.F. with command of air operations over the vast territory from Malta to the Egyptian desert front, the Persian gulf and Madagascar. Tedder was credited with having smoothed over the friction between the R.A.F., the army and navy on the desert front in 1941. In late Nov. 1942, Tedder flew to Algeria to confer with Lt. Gen. Dwight Eisenhower, Admiral Sir Andrew Cunningham, commander of allied naval units, and Maj. Gen. James Doolittle, on co-operative strategy in Tunisia. Tedder was promoted to vice-chief of air staff of the R.A.F. on Nov. 27, 1942.

Telegraphy.

The widening field of military activity during the year 1942 continued to affect international communications by telegraph and more and more to restrict domestic wire communications services and development to the necessities of the military effort. Nevertheless certain advances were made some of which may briefly be mentioned.

Maximum Usage of Trunk Lines, for some years the subject of study and development, took on added importance. The extended use of direct circuits and of such devices as carrier systems, the varioplex, reperforator switching, improved repeaters, sub-centre switching, etc., was increasingly necessary.

Vacuum-Tube Repeaters, used extensively in telephone circuits, were improved and used to some extent in telegraph circuits. They operate successfully for long periods of time without attention and hence may be installed in offices lacking the staff required to operate and maintain the electro-mechanical type of telegraph repeater.

Reperforator Switching continued to grow in favour and additional installations were being made. In offices equipped with this apparatus, manual relays of telegrams are eliminated and greater speed, accuracy and economy is assured. An improvement provided, automatically, a complete number sheet record of each message switched through the office, thus contributing to smoother operation and facilitating the prompt tracing of messages about which inquiry is received. The use of reperforator switching by leased wire systems was extended during the year.

Facsimile Telegraphy, coming more and more into use, showed continued improvement through experience and continued laboratory work. For the first time this method of telegraphy was used in the movement of trains. An improved type of cut-blank recorder in which incoming messages are recorded upon blanks fed from a continuous roll of printed paper and cut off at the end of each message, proved its efficiency. Another type of recorder was arranged to repeat, automatically, a message of which a number of copies are desired. A compact type of transmitter for use in patrons' offices was developed. In some forms of facsimile apparatus the speed of transmission and recording was considerably increased. Facsimile telegraph service between a customer's office in one city and the telegraph company's office in another city was inaugurated for the first time during 1942. Multifax, a development of the facsimile telegraph, is a business machine for the automatic preparation of stencils, copies, etc., in considerably less time than by other methods and assures absolute accuracy. The multifax principle was extended to the preparation of stencils, copies, etc., at a distance.

Multiple Tape Perforators were developed, by means of which large books of messages for transmission to many points are simultaneously reduced to prepared tape form for automatic transmission.

Magnetic Cores, the principal ingredient of which is carbonyl iron, were successfully used in the manufacture of loading coils and tuning inductances for telegraph carrier systems.

Statistics.—Reliable statistics covering the telegraph systems of the world were not available in 1942, but the latest comprehensive data for the land line wire telegraph systems of the United States (aside from that of telephone companies) showed the following plant devoted to the public service:

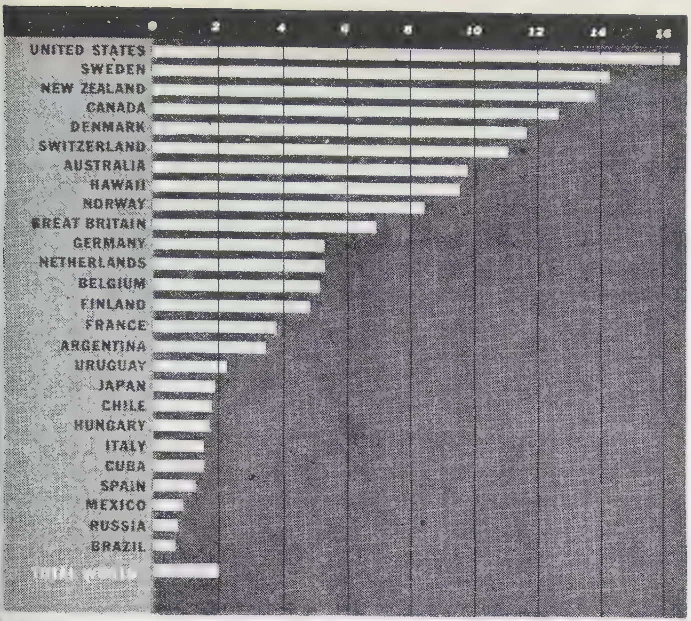
Miles of pole line	241,967
Miles of underground conduit (single duct)	6,137
Miles of aerial wire	1,820,773
Miles of aerial cable wire	119,423
Miles of underground cable wire	329,420
Miles of land line submarine cable wire	6,381
Total miles of land line wire (approximately 75% copper)	2,275,997
Number of telegraph offices	23,013
Approximate investment in operated land lines plant	$372,761,970
Approximate number of revenue messages transmitted (year 1940)	195,750,824

The submarine cable telegraph systems of the world, so far as indicated by the latest available data, consisted of about 360,000 mi. of ocean cable, containing about 432,000 mi. of copper conductors and representing a capital outlay of about $400,000,000. Approximately 80% of the total mileage of ocean cables was provided by private enterprise and the remainder by government administrations. (A. N. Ws.)

Telephone.

The needs of war raised the demand for telephone service in the United States to a new high level in 1942. The number of telephones increased by more than 1,300,000, reaching a total of about 24,800,000 by the end of the year. The number of telephone conversations averaged about 108,000,000 a day, some 4,000,000 above the corresponding 1941 figure. Completed toll calls in 1942 were estimated at 1,185,000,000, approximately 9% more than in 1941. The number of longer haul conversations was about a third greater than in 1941, and over numerous war-important routes there were increases

MEMBERS of the U.S. army signal corps receiving instruction in the operation and maintenance of teletypewriters in a Bell System training school in 1942



TELEPHONES per 100 population in various countries of the world, 1940–41

in traffic which average figures for the U.S. as a whole did not begin to suggest.

Nearly 3,000,000 circuit-miles of newly constructed toll facilities were placed in service in 1942—more than three-quarters of it being developed by carrier systems—but scarcity of materials made it impossible to build all the lines needed to keep ahead of mounting traffic. For that reason, the telephone companies widely advertised to the public the need to avoid unnecessary calls on war-busy routes. Order Number 20 of the Board of War Communications, made effective Nov. 1, 1942, provided that priority might be given to certain urgent toll calls as defined in the terms of the order.

General Conservation Order L-50 of the War Production board, issued in the spring, established the broad rule that telephone companies could provide new or additional exchange service only where line and switchboard facilities were already available as the result of previous construction. The order made exceptions to provide for service needed for war, public health, welfare or security. The telephone companies had many months previously begun their efforts to conserve materials and they continued to do so by all possible means.

Some 1942 Achievements.—The new transcontinental cable of the Bell system, running 1,600 mi. underground from Omaha, Neb., to Sacramento, Calif., and connecting at those points with the eastern and Pacific coast cable networks, was placed in service Dec. 21, 1942. This made it possible, for the first time, to telephone from coast to coast over all-cable facilities, and added greatly to the dependability of transcontinental service, especially important in time of war.

By the end of the year the number of government war projects requiring new or greatly enlarged facilities had reached approximately 2,500. Thousands of miles of private line circuits were provided for the military and other government departments. Handling of aircraft warning calls was speeded, and civilian defense telephone arrangements were improved. Special efforts were made to give personal service to soldiers and sailors. Arrangements were made to train thousands of soldiers in communication crafts at telephone company schools. Telephone company men and women, at the army's request, were maintaining and operating an increasing number of army telephone systems. Additional measures taken to protect telephone service against war damage included provision of pre-engineered and packaged switchboard units which could be quickly moved to the scene of disaster from strategic locations.

Telephone manufacturers greatly restricted their output for regular telephone purposes and concentrated on production of communication equipment for the armed forces. For example, the Western Electric company, manufacturing unit of the Bell system, increased its production of war materials—including radios for tanks and planes, field telephones, field wire, battle announcing systems for warships, and many types of secret equipment—more than seven times over 1941.

Telephone research was likewise at war. All available resources of Bell Telephone laboratories in 1942 were devoted to development of war tools involving communications techniques, or to related purposes. At the end of the year the laboratories were working on more than 300 development projects for the army, navy and National Defense Research committee.

In 1942 the telephone industry of the United States, thanks to co-operative effort by all units, resourceful application of the results of continuous research, and diligent endeavours to make the most of existing facilities and materials, successfully met the task of giving to the United States at war a greater quantity of fast, dependable communication than had ever been required before. (W. S. G.)

Telescopes.

Although the war interrupted and reduced astronomical research all over the world, 3 important new telescopes were completed and put into operation during 1942. The largest of these was in the southern hemisphere, where further observations with powerful telescopes were greatly needed. The new telescope in Mexico could also reach many southern objects of exceptional interest.

60-inch Reflecting Telescope (F 4.9) of the National observatory, Cordoba, Argentina. Operated in 3 combinations: Newtonian, 24.5 ft. focal length; Cassegrainian, equivalent focal length, 103 ft.; Coudé, equivalent focal length, 214 ft. Designed primarily for astrophysical research. One grating spectrograph completed and others under construction.

27-inch Schmidt-type Telescope (F 3.5) of the National observatory of Mexico. Located at Tonanzintla near Puebla, elevation about 7,000 ft. Concave mirror 31 in. in diameter, correcting plate 27 in. Planned especially for direct photography and photometry of the southern Milky Way.

24-inch Schmidt-type Telescope (F 3.5) of the Warner and Swasey observatory, Case school, Cleveland, Ohio. Concave mirror 36 in. in diameter, correcting plate 24 in. Stars to photographic magnitude 18.4 have been photographed in 9 min. with this instrument.

The mounting of the 200-in. telescope of the California Institute of Technology on Palomar mountain in southern California was to a large extent completed and erected, but no attempt was made in 1942 to instal the driving and control mechanism. Optical figuring of the 200-in. and auxiliary mirrors was continued to a point at which the time for completion should coincide closely with that required for the remaining mechanical parts of the telescope. (W. S. Ad.)

Television.

Pearl Harbor, and the consequent entry of the United States into World War II, came to pass only about five months after television had at last turned the famous "corner" which, for so many years, it had been "just around." Thus the life of public television, and its opportunity to develop into a self-supporting economic entity analogous to the everyday broadcasting of sound programs, extended only from July 1, 1941, until shortly after Dec. 7. During the year of 1942, on account of the necessary diversion of men and ma-

TELEVISING INSTRUCTIONS FOR AIR-RAID WARDENS in New York city in 1942. Wardens had only to visit their police precinct to receive their instruction through television receiving sets

terials to more direct war purposes, television broadcasting saw only retrenchment—nothing of the long-anticipated and long-awaited expansion.

It is ironical that the contraction of television activities in the civil field, because of wartime requirements, might have been reversed if the science had been recognized as a potential public service a few years earlier. The fact that it was economically and patriotically unwise to apply manpower to the production of daily and extensive television programs, for broadcasting in the several large cities where television transmitters were established and were in part-time operation, resulted almost wholly from the fact that there were only a relatively few home television receivers in use. In the greater New York area, for example, where daily television programs were made available throughout the latter half of 1941 by both the National Broadcasting company (WNBT) and the Columbia Broadcasting system (WCBW), and where a third station operated by Dumont was momentarily expected to deliver a similarly extensive program, it was estimated that not more than 15,000 homes were equipped to receive the televised pictures. In contrast to this, homes in the same geographical area contained more than 3,000,000 regular sound broadcast receivers. Assuming that television users turned to their televisors in about the same proportion as broadcast listeners used their receivers, it was probable that the two active New York stations seldom had audiences of more than a few thousand families each, and that the average audience was considerably less. Television of this order of magnitude could hardly be rated as "mass communication" in a city where normal radio audiences ran as high as 2,000,000 families for an especially important program.

If radio users had had several years, however, in which to learn the value and utility, the interest and importance, of television, and in which to purchase adequate television receivers at reasonable prices, a totally different situation might well have developed. Sound broadcasting, with its ability to reach nearly the whole population instantaneously and simultaneously, and with its demonstrated ability to inform the public, to recruit manpower and money for the war, and to aid in maintaining civil and military morale, was recognized as an essential war industry. While it was not expanding, its needs for the maintenance of its service and stature were being met by the allocation of material under suitable preference ratings and by the deferment of essential men. Had television enjoyed a real opportunity to make a real start, one might reasonably assume that, like sound broadcasting, it would be performing a genuinely essential service, its capacity for bringing living sound and graphic motion simultaneously before millions of observers being utilized on an increasing scale.

In spite of the fact that television's limited audience, numerically speaking, did not warrant rating it as a medium of mass communication rivalling the normal broadcasting of sound alone, television's inherent and particular ability to emphasize sound by backing it up with sight (or vice versa) was being put to constructive wartime use. In New York city, and, it was understood, in other cities, television receivers were installed at the meeting places of workers in the Civilian Defense Volunteer office, the Red Cross, the American Women's Voluntary service and other civilian organizations contributing to the war effort. Thus television was made available to specially interested audiences of very substantial size, and the system became an effective basis for the distribution of illustrated lectures to air-raid wardens, first aiders and other similarly interested groups. During 1942, many such training courses were given, and their success was attested by the fact that they were repeated again and again.

(J. V. L. H.)

Great Britain.—The main published work in Great Britain in 1942 was again that of J. L. Baird, since the research departments of the various manufacturers were confined to war applications of television. His experimental stereoscopic colour system in which the images were viewed directly through a magnifying lens was abandoned in favour of the anaglyph system owing to the difficulty of arranging direct viewing by an audience of several people.

In the anaglyph method the frames are projected on the viewing screen as slightly displaced red and blue pictures, the viewer being equipped with glasses having a red filter for the right eye and a blue filter for the left eye. The picture then stands out in proper relief when viewed through the colour filters.

When stereoscopy is combined with colour, the anaglyph principle is not altogether satisfactory, as the right eye sees only red and the left eye only blue. Any frame in which either of these colours predominates will therefore lose the effect of relief.

It appeared that stereoscopic viewing was more successful when applied to monochromatic pictures, and in this case the additional apparatus required to adapt a receiver for stereoscopy was not expensive or elaborate. The main addition was a rotating two-colour filter disk, mounted in front of the screen and synchronized with the field frequency, and while this did not mar the reproduction of ordinary monochromatic pictures, it could be swung out of the way of the screen when not required.

Tellurium. There was an enormous expansion in the production and use of tellurium in the United States in 1941, with output increasing 162% to 224,640 lb., and sales 170% to 240,000 lb. Canadian production also increased, but no statistics were reported.

(G. A. Ro.)

Tempest, Dame Mary Susan (1866–1942), British actress and favourite of theatregoers on both sides of the Atlantic, was born July 15 in London. She studied piano in Paris and won medals as a student of voice at the Royal Academy of Music in London. For nearly a decade she starred in light opera, and made her American tour with the Duff Comic Opera company. A London musical comedy producer had to buy out her American bookings in order to get her ack in London to star in *An Artist's Model* in 1895. At the turn f the century, she abandoned light opera for straight comedy les and made an auspicious start as Nell Gwyn in *English Nell.* n 1925 she appeared in London in *Hay Fever,* a play written for er by Noel Coward. Her last appearance on the stage was in *The irst Mrs. Fraser.* Illness prevented her from taking part in a new how she was rehearsing shortly before her death. Further misortune beset her during the bombings in London, when her home as demolished and most of her possessions lost. She was made ame Commander of the Order of the British Empire in 1937. Ier death was reported in London, Oct. 15.

emple, William: *see* Canterbury, Archbishop of.

ennessee. A south central state, 16th to enter the union, called the "Volunteer State." Land area 41,961 q.mi.; water area 285 sq.mi.; pop. (1940) 2,915,841; rural 1,88,635; urban 1,027,206; rural farm 1,271,944; native white ,395,586; Negro 508,736; foreign-born 11,320; other races 199. apital, Nashville (167,402). Other cities include Memphis (292,42); Chattanooga (128,163); Knoxville (111,580).

History.—Prentice Cooper, Democrat, was re-elected governor ov. 3, 1942. Other state officials were as follows: secretary of ate, Joe C. Carr; state treasurer, John W. Horton; comptroller f the treasury, Robert W. Lowe; adjutant general, Thomas A. razier; attorney general, Roy Beeler. Commissioners were as llows: agriculture, C. C. Flanery; conservation, J. Charles Poe; lucation, B. O. Duggan; finance and taxation, George McCandss; highways and public works, C. W. Phillips; institutions, . T. Taylor; welfare, Paul Savage; insurance and banking, J. M. IcCormick; labour, S. E. Bryant; public health, W. C. Williams; ilways and public utilities, W. D. Hudson, Porter Dunlap and eon Jourolman. In the November election for the house of repsentatives, the Democrats polled 102,143 votes; the Republins, 52,368.

Education.—In 1941, of 5,541 elementary schools, 1,497 had ree or more teachers; the number of one-teacher schools deined from 3,555 in 1927 to 2,515 in 1941. Enrolment in eleentary schools in 1941 was 521,129. In 1941 there were 589 gh schools with a total enrolment of 126,285; the number of achers was 5,227.

Public Welfare, Charities, Correction.—In June 1941, 121,3 people received public assistance amounting to $2,825,000; PA recipients 29,449, amount $1,396,000; old-age recipients, ,154, amount $408,000; aid to dependent children, 35,921 4,343 families), amount $267,000; aid to blind, 1,645, amount 8,000. In 1940–41 there were seven correctional institutions th approximately 4,306 inmates; expenditures, $1,156,231. In 40 payment for unemployment compensation was $6,275,000; mber of initial claims, 125,000; continued, 1,229,000. Separate hools were maintained for the blind, the deaf and the underivileged; three state hospitals for the insane; a home and aining school for feeble minded.

Communication.—In 1940, of about 82,000 mi. of public road, 520 mi. were state highways; state expenditures were $10,794,7 for the year ending June 30, 1940. There were 3,573 mi. of ilroads in 1941; as of Oct. 1942 there were 26 airports; 718 mi. airways; 307,000 telephones in the state, of which 211,000 ere residential and 96,000 business. Water-borne commerce on e Tennessee river in 1940 amounted to 2,206,913 short tons; mberland river, 852,138; Mississippi river, 7,055,675 short tons om Ohio river to Baton Rouge, and 1,841,068 at Memphis.

Banking and Finance.—On May 20, 1942, there were 70 naonal banks with 17 branches, and 227 (June 30, 1942) state nks with 32 branches; assets, $667,614,000 for national and $245,801,997 for state banks; deposits, $616,607,000 for national banks and $219,574,397 for state banks. Savings and loan associations in 1940 numbered 39, with assets of $30,240,032.

Total state revenue for the fiscal year 1941–42 was $55,488,103; revenue shared with counties and cities $8,601,362; revenue for state purposes, $46,886,741. Direct bonded debt for the state June 30, 1942, $95,289,000; highway reimbursement debt, $13,770,104; gross debt $109,059,104; unencumbered surplus in sinking fund, June 30, 1942, $12,033,176; net debt $97,025,928.

Agriculture.—There were 247,617 farms in 1940; 18,492,898 ac. in farms, with 6,158,662 ac. of cropland harvested. Gross value of agricultural production in 1941 was $264,483,000; cash farm income, $203,880,000 (including government payments); cash farm income from crops was $110,616,000; from livestock and livestock products, $80,840,000; government payments to farmers, $12,424,000. Gross farm income from crops was $133,722,000 in 1941. The forest area was about 14,000,000 ac.

Table I.—*Leading Agricultural Products of Tennessee, 1942 and 1941*

Crop	1942*	1941
Corn, bu.	74,518,000	69,615,000
Tame hay, tons	2,230,000	2,148,000
Cotton, bales	614,000	598,000
Wheat, bu.	5,612,000	5,415,000
Tobacco, lb.	93,675,000	88,310,000
Potatoes, bu.	3,483,000	2,604,000
Sweet potatoes, bu.	4,400,000	4,664,000

*Estimated.

Manufacturing.—In 1939, 2,289 manufacturing plants yielded products valued at $728,087,825, of which $320,341,902 was added by manufacture. The number of wage earners increased from 107,645 in 1925 to 131,874 in 1939; wages paid in 1939, $109,661,769.

Table II.—*Principal Industries of Tennessee, 1939 and 1937*

Industry	Value of products	
	1939	1937
Rayon and allied products	$59,724,728	$59,132,660
Hosiery	33,798,963	29,219,241
Meat packing, wholesale	28,266,104	29,491,149
Chemicals	25,639,499	38,048,635
Cooking and other edible fats	19,787,646	36,457,022
Footwear (except rubber)	17,740,737	20,897,976
Flour and other grain mill products	16,147,788	22,673,578
Cottonseed oil, cake, meal linters	15,390,972	20,150,709

Mineral Production.—The total value of minerals produced in Tennessee in 1939 was $40,119,893, as compared with $32,428,512 in 1938.

Table III.—*Principal Mineral Products of Tennessee, 1939 and 1938*

Mineral	Value 1939	Value 1938
Coal	$10,402,000	$9,007,000
Stone	8,312,977	4,237,351
Cement	5,613,477	5,063,628
Phosphate rock	3,856,505*	....

(C. E. A.)

Tennessee Valley Authority. The Tennessee Valley authority in 1942 was gearing its organization to the United States war effort, by supplying power to war industry and building new hydroelectric plants; by strengthening the land for more and better food production; by producing ammonium nitrate for munitions and elemental phosphorus for chemical warfare, and by preparing to produce calcium carbide for synthetic rubber.

Improved phosphate fertilizers developed by TVA had strengthened the soil for more and better food production in a farm program directed by state agricultural extension services on 25,000 demonstration farms in 27 states. The authority was perfecting a process to produce alumina, raw material of aluminum, from abundant domestic clays; was carrying on extensive research for utilization of vermiculite and for magnesium-bearing olivine; was carrying out mapping assignments from the war department; was putting into practical use a demountable house built in three-dimensional sections and its smaller counterpart, a trailer house. The two house types were being built sectionally by mass production methods, both by the authority and under private contract. In addition, TVA was assembling extensive data on forest resources of the Tennessee valley enabling industry to locate supplies of wood needed for war production.

TVA was created by act of congress in 1933 for the regional development of a river valley embracing 41,000 sq.mi. in parts of the states of Tennessee, Alabama, Mississippi, Georgia, North Carolina, Kentucky and Virginia. The area in 1942 reached by TVA power embraced approximately 70,000 sq.mi.

In 1942, the series of dams on the main stream was complete except for two under construction, one at each extremity of the river (Kentucky dam, near Paducah, Ky., and Fort Loudoun dam, near Knoxville, Tenn.). TVA had received Wilson dam from the federal government, had acquired Hales Bar dam from a private utility by purchase, and had built Pickwick Landing, Wheeler, Guntersville, Chickamauga and Watts Bar dams.

On tributaries of the Tennessee river, TVA had built and was operating Norris dam, on the Clinch river; Hiwassee, Chatuge and Nottely dams, on the Hiwassee river system; and Cherokee dam on the Holston river.

TVA was building, as war emergency power projects, Douglas dam on the French Broad river; Fontana dam on the Little Tennessee river; Watauga and South Holston dams on the Holston river system; Apalachia and Ocoee No. 3 dams on the Hiwassee river system. Acquired from a privately owned utility company by purchase were Ocoee No. 1, Ocoee No. 2, and Blue Ridge dams on the Hiwassee river system.

Installed power capacity of the authority's generating system, which included several steam plants, had reached 1,500,000 kw. by the end of the calendar year of 1942. Congress had authorized a total installed capacity which would approximately double the figure. About one-half the additional capacity was being installed as rapidly as the construction could be completed.

In 1942, a contract was entered into by the Aluminum Company of America and TVA in which the site of Fontana project, in North Carolina, was deeded to the authority and it was provided that on completion of Fontana the Aluminum company's five dams on the Little Tennessee river system would be operated as units of the TVA system. The five plants of the Aluminum company (Cheoah, Calderwood, Santeetlah, Nantahala and Glenville) in 1942 had a total installed power capacity of 307,300 kw.

The authority and five municipal and four co-operative distribution systems bought power generation, transmission and distribution properties of the Kentucky-Tennessee Power and Light company in twelve counties of southwestern Kentucky.

Gross power revenues of the authority for the 1942 fiscal year ended June 30, 1942, exceeded $25,000,000. TVA power was sold at wholesale to 83 municipalities and 45 co-operatives, which distributed it to more than 500,000 retail customers.

In lieu of taxes, fiscal year 1942 payments totalling $1,859,416 were disbursed to six states and 113 counties by the authority in accordance with provisions laid down by congress. In addition, co-operative and municipal distributors of TVA power paid approximately $1,850,000 in taxes and tax equivalents on their electric systems during the same period. Thus the combined annual TVA-contractor tax and in-lieu payments for fiscal 1942 amounted to more than $3,700,000. TVA employed 39,579 persons on June 30, 1942.

Congressional appropriations to the authority amounting to $196,800,000 for the fiscal year 1942 and $136,100,000 for the fiscal year 1943 brought total appropriations, plus $65,072,500 in bond proceeds, to $733,041,770.

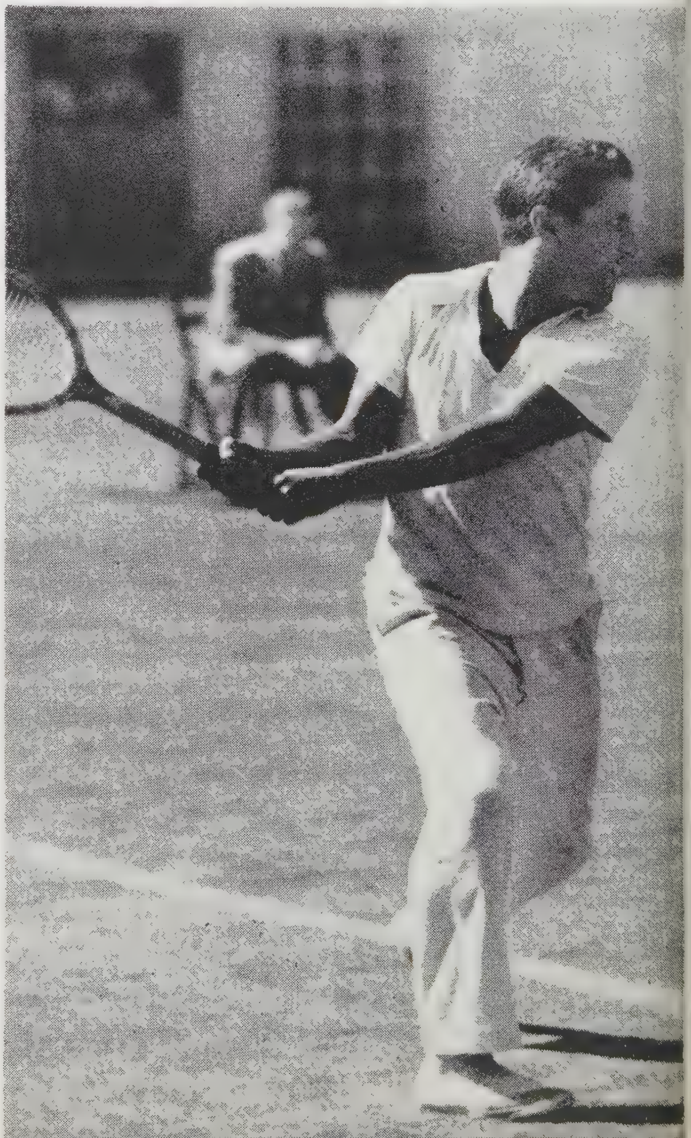
The chairman of the board of directors of the authority in 1942 was David E. Lilienthal. James P. Pope was reappointed to the board of directors by President Roosevelt for a nine-year term. (*See* also DAMS; ELECTRICAL INDUSTRIES; PUBLIC UTILITIES.)

(W. L. S.)

Tennis. Although some tournaments were cancelled either for lack of attractive competition or sufficient galleries or both, the majority were held as usual and the attempt was made to conduct the game through the summer months of the year. The national singles and doubles championships, which took place at the West Side Tennis Club at Forest Hills, showed this to be a popular decision with sporting crowds, for good-sized audiences came for the last days.

Although the quality of the play and the average class of the field was certainly the poorest in some years, Frederick R Schroeder, Jr., of Glendale, California, who became the last singles champion until after the war, seemed to be a better

FRANCISCO ("PANCHO") SEGURA, Ecuadorian star who uses a double-handed forehand drive, won the U.S. Eastern Clay Court championship in 1942



tennis player than the victors of 1941 and 1940. He had a sound, forceful game, a Californian service and volley backed by excellent ground strokes.

The class of the women's field, with the withdrawal of Miss Helen Jacobs and Mrs. Sarah Palfrey Cooke, was even lower than the men's. In the absence of any top rate player, Miss Pauline Betz of Florida defeated Miss Louise Brough of Los Angeles in a close 3-set match in the final round. The men's doubles title was captured by William Talbert of Cincinnati, Ohio, and Gardnar Mulloy of Florida, who defeated Schroeder and Sidney B. Wood of New York in straight sets. (J. R. Tu.)

Terhune, Albert Payson (1872–1942), U.S. author, was born Dec. 21 in Newark, N.J. He joined the staff of the old *New York World* in 1894 and wrote several novels that enjoyed moderate success. After two decades of writing "pot-boilers," he met immediate success with a novel called *Lad: A Dog* (1919), a story about a collie. The book proved so popular that Terhune wrote almost a score of novels woven about the dogs in his famous Sunnybank kennel in New Jersey. These books include: *Bruce* (1920); *Buff: A Collie* (1921); *Further Adventures of Lad* (1922); *The Heart of a Dog* (1926); *Lad of Sunnybank* (1928); *A Dog Named Chips* (1931); *The Way of a Dog* (1934); and *A Book of Famous Dogs* (1937). He died in Pompton Lakes, N.J., Feb. 18.

Ter Poorten, Hein: *see* Poorten, Hein ter.

Terra, Gabriel (1872–1942), Uruguayan politician, was born in Montevideo and was graduated with the degree of doctor of law from the University of Montevideo in 1895. After a steady rise in Uruguayan politics, via the chamber of deputies and the cabinet, he was elected president in 1931 on a platform of support for the constitution of 1919. But Terra staged a coup d'état in 1933, seized dictatorial power and ignored the constitution, considered by many to be a model in its checks on abuse of executive power. He dissolved the national administrative council and the congress, modified the constitution to permit his own re-election in 1935, and a year later drafted a new charter which substantially strengthened his own position. In 1935, he was shot in the shoulder by a former nationalist deputy, and later that year sporadic attempts at revolution broke out. In 1938, he stepped down from the presidency and was succeeded by his brother-in-law, Dr. Alfredo Baldomir. Dr. Terra died Sept. 15, 1942, in Montevideo.

Texas. A south-central state of the United States, admitted to the union in Dec. 1845; popularly known as the "Lone Star state." Area, 263,644 sq.mi. (plus 3,695 sq.mi. of inland water surface); pop. (1940), 6,414,824. Rural population was 3,503,435 or 54·6% of the total. Negroes and other non-whites constituted 14.5% of the population. Capital, Austin (87,930). The three largest cities are Houston (384,514); Dallas (294,734); San Antonio (253,854).

History.—During 1942 the life and economy of the people of Texas were thoroughly disrupted by the war. The rate of enlistments in the armed services was higher than in any other state of the union. War workers crowded cities and towns. There was a scarcity of farm labour. A result of these disruptions was a lack of interest in local politics.

In the second Democratic primary (in August) U.S. Senator W. Lee O'Daniel defeated James Allred, who had the strong support of the national administration, by a narrow margin (451,359 to 433,203). Only a small minority of qualified voters went to the polls. O'Daniel, after re-election to the senate, led the fight against the drafting of 18 and 19 year-olds. The antiadministration trend in Texas politics was echoed by Coke R. Stevenson (re-elected governor), who protested against rationing, and John Lee Smith (elected lieutenant governor) who criticized federal labour policy.

Other state officers re-elected were Gerald Mann, attorney-general; Jesse James, treasurer; James P. Alexander, chief justice of the supreme court; Bascom Giles, commissioner of general land office; J. A. McDonald, commissioner of agriculture; L. A. Woods, superintendent of public instruction; George H. Sheppard, comptroller.

Education.—For 1941–42 elementary schools had an enrolment of 789,896 white pupils and 178,275 Negro. Secondary schools had an enrolment of 305,154 whites and 38,484 Negroes. The total teaching staff was 49,434.

Public Welfare, Charities, Correction.—In 1942 182,483 recipients of old-age assistance received a total of $41,798,969. More than $880,000 was expended on aid for the needy blind, with 4,000 persons the highest case load in any one month. During the year, $2,783,861 was expended on aid to dependent children, with a maximum case load, for any one month, of 22,501 families and 45,945 children. WPA's rolls declined during the year from 62,012 at the beginning of Jan. 1942 to 14,649 at the end of Dec. 1942; during the first six months of 1942, certified workers were paid $14,293,350 in wages. The Texas Unemployment commission approved an estimated 85,000 claims during 1942 and issued 238,344 payments amounting to $4,058,784.

Eleemosynary institutions in the state numbered 22, of which 11 were hospitals for mental and nervous cases. The remaining institutions consisted of sanatoriums for tuberculars, schools for the blind and for the deaf (white and Negro); two homes for delinquent children; two for white orphans and one for Negro; one for crippled children; a home for Confederate veterans and one for the widows of veterans. During 1942 the state cared for more than 25,000 inmates in these institutions.

Communication.—The state in 1941 had 26,459.42 mi. of highways; including 23,997.24 mi. maintained by the state, 600.88 mi. in urban areas, and 1,861.30 not maintained wholly by the state. The amount spent by the state for regular maintenance, improvements and traffic services amounted to $9,379,940.06. Amount spent for highway construction was $23,686,500.52. There were more than 22,000 mi. of railway track in 1942.

Banking and Finance.—As of Dec. 31, 1942, there were 391 state banks in Texas with total resources of $428,580,949.32, including savings. Individual deposits amounted to $291,946,979.89, and deposits in savings departments amounted to $11,510,893.53. As of June 30, 1942, there were 439 national banks and 299 federal savings and loan associations in Texas. The total deposits of national banks in Texas at that date was $1,849,199,000, and their resources totalled $1,855,401,000.

Total gross cash receipts of the state treasury at the end of the fiscal year of 1942 amounted to $350,678,126.74. Total gross cash disbursements for the fiscal year were $292,753,922.40. At the beginning of the fiscal year, the cash balance in state funds was $70,686,694.12. At the end of the fiscal year, the cash balance was $57,924,204.34. As of Dec. 31, 1942, the state's gross bonded indebtedness was $6,871,950.00; its net bonded indebtedness was $4,102,200. On the same date, total warrants outstanding and unpaid in the general revenue fund amounted to $33,500,064.43. Its net warrant debt was $28,398,911.37.

Agriculture.—The total value of agricultural production in Texas during 1942 was estimated at $665,329,000. The total acreage harvested was in excess of 27,000,000. The total cash income from crops, livestock and government payments amounted to $839,981,000 during 1942.

Leading Agricultural Products of Texas, 1942 and 1941

Crop	1942 (est.)	1941
Wheat, bu	47,280,000	27,186,000
Barley, bu..	4,931,000	9,750,000
Oats, bu.	11,837,000	37,975.000
Peanuts, lb.	583,000,000	156,040,000
Grain sorghums, all, bu.	82,118,000	79.724,000
Rice, bu..	19,552,000	13,600,000
Hay, tons	1,777,000	1,555,000
Cotton (ginnings), 500 lb. bales	3,403,000	2,652,000
Peaches, bu.	508,000	376,000
Pecans, lb.	10.350,000	22,100,000
Grapes, tons	2.200,000	2,400,000

Manufacturing.—In 1942 the value added by manufacturing, exclusive of wages paid workers, was $451,000,000, as compared with $355,000,000 for 1941. Nonagricultural payrolls for 1942 were estimated at $1,956,000,000 as compared to $1,383,000,000 in 1941. Texas had its greatest construction year in 1942, with awards for buildings totalling $825,704,245.

Mineral Production.—The value of minerals in Texas in 1941 was about $836,260,000, compared with $686,323,000 in 1939, with oil and gas fields dominating production. In addition, the large iron deposits, smelted by use of gas heat rather than by coal, were being exploited, and other minerals useful to the war effort were being mined. (C. W. RA.)

Texas, University of.

An institution of higher education at Austin, Tex. The 60th annual session opened Sept. 21, 1942, on a 12-month war training basis. A total of 47 new war courses were opened in February, 37 in September, bringing the number of offerings to approximately 1,400, in 47 fields. A new undergraduate department of aeronautical engineering was opened, a new degree of bachelor of science in physics almost doubling mathematics and physics requirements was created, and a war-emergency training program in physics was set up to turn out fully trained physicists in 20 months. Virtually all able-bodied men students were enrolled in one of the military reserves. The first "Intersession," a special three-weeks' session between summer school and long session, was held Aug. 25–Sept. 12, 1942, to round out the 12-months-a-year war training schedule. In its engineering, science and management war training program, in co-operation with the U.S. Office of Education, the university trained 2,700 men and women for war assignments between Feb. 1941 and July 1942, and was training 3,000 in 1942–43. All research projects were converted to war purposes. The medical branch at Galveston graduated its 50th class in Dec. 1942, five months ahead of prewar schedule. Dr. Chauncey D. Leake, formerly pharmacologist at the University of California, became vice-president and dean in charge of the medical branch; Dr. E. W. Bertner, Houston physician, was named temporary director of the new cancer research centre in Houston. For statistics of enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (H. P. R.)

MOHAIR WAREHOUSE at Kerrville, Texas. Large stocks of this material, formerly used in U.S. motor car upholstery, were available in 1942 to help ease the wool shortage

Textile Industry.

Textile World's index of mill activity for 1942 was approximately 200 (on the basis of 1923–25 as 100). The three previous records had been 188 in 1941, 142 in 1940 and 132 in 1939. The fact that the 1942 index was only slightly (about 6%) above 1941 was due purely to the inability to raise the production schedules any higher because of limitations of materials, machinery, etc.

The great bulk of the industry's production was going into textiles for the armed services, for lend-lease, for allied agencies such as Red Cross and civilian defense agencies, and essential industrial needs, directly or indirectly tied up with the war effort. That meant that the remainder was necessarily directed toward essential civilian needs. Civilians therefore found increasing shortages in textiles—particularly in selectivity.

The contribution of the textile industry to war effort, whereby unprecedented output was achieved with practically no addition of equipment, was due to sharp increases in the number of shifts, and to conversion of plants from civilian to military use. The best known example of such conversion was the carpet industry which, deprived of raw material for production of its civilian product, converted its looms to the manufacture of duck and blankets, two extremely important items in the military picture.

War's Effect on Apparel.—Thus far, war made little change in the appearance of people's clothes. There were only such minor effects as the elimination of cuffs from men's trousers, the snipping of a few inches off nighties which hitherto swept the ground, and the official banning of the zoot suit. A program of further simplification partially based on the British "utility clothing" production, was being studied by officials of the Office of Civilian Supply of the War Production board. (*See* also COTTON; RAYON AND OTHER SYNTHETIC FIBRES; WOOL.) (D. G. Wo.)

Thailand (Siam).

A kingdom of southern Asia between Burma and French Indo-China, extending southwards into the Malay peninsula; area 198,247 sq.mi.; pop. (census 1937) 14,464,489 (est. March 1940) 15,717,000. Chief towns: (pop. 1937) Bangkok (former cap. 681,214); Chiengmai (544,001); Khonkaen (473,475); Chiengrai (443,476). Ruler (1942): King Ananda Mahidol; language: Siamese; religion: Buddhism.

History.—After the Japanese invasion, Thailand was under Japanese influence both politically and economically. Thailand declared war on Great Britain and the United States on Jan. 25, 1942, and Thai troops invaded Burma. Industries belonging to enemy subjects were taken over by the government early in the year, and a company was formed to work the tin and rubber industries.

On February 1 the government announced the adoption of a new currency exchange system based on a gold standard fixing the baht at .032,639 grams of pure gold. Foreign exchange transactions were controlled. On April 22 Japan and Thailand concluded a yen-baht exchange parity agreement. By a further agreement of May 2, settlement of trade accounts between the two countries was to be in yen instead of pounds or dollars. An agreement of June 18 between the Bank of Japan and the Thailand finance ministry allowed the latter to borrow up to 200,000,000 yen over a five-year period; the object was to enable Thailand to acquire gold from Japan as security for her currency.

The government resigned on March 9, and the premier, Marshal Luang Pibul Songgram, formed a new government with fewer ministers, mostly military men. A compulsory labour service of six months for the male population was established. The government decided in May to transfer the capital to Saraburi, a sacred town in the hills about 75 mi. northeast of Bangkok; the latter would remain the chief trading centre. The Nanking puppet government was recognized in July. A Free Thai movement opposed to Japanese control was stated to exist in the country itself, and anti-Japanese rioting was reported. A Free Thai movement was established in the United States and Great Britain. Great Britain decided on February 20 to revert to the name "Siam" for official use.

(*See* also WORLD WAR II.) (M. Cs.)

Education.—In 1938–39: government schools 429; scholars 61,297; local public and municipal schools 11,072; scholars 1,484,483; universities 2; students (1937) 11,525.

Banking and Finance.—(1942) revenue, 210,000,000 baht; expenditure 259,000,000 baht, expenditure, capital (est. 1941) 56,056,000 baht; public debt (Mar. 31, 1940) 69,000,000 baht; notes in circulation (July 31, 1941) 226,000,000 baht; reserves (July 31, 1941) gold 97,000,000 baht; foreign assets (July 31, 1941) 152,000,000 baht; exchange rate (average 1940) 1 baht=35.15 cents U.S.; (Sept. 1941) 1 baht=36.97 cents U.S.

Trade and Communication.—Foreign trade 1940–41 (merchandise): imports 163,400,000 baht; exports 257,600,000 baht. Communications: roads, state highways completed (1938) 1,815 mi.; railways, open to traffic (1938) 1,925 mi.; airways, length of route opened (1938) 444 mi.; motor vehicles licensed (1937–38): total 11,439 (cars 5,910; trucks 4,233; buses 146; cycles 559); wireless receiving set licences (1938) 29,834.

Agriculture and Mineral Production.—Production (in metric tons): rice (1939–40), 5,082,700; rubber (1940 exports) 45,000; tin ore, metal content (export 1940) 17,700; tobacco (1938–39) 8,400; cotton ginned (1940–41) 2,400; maize (1938–39) 5,600.

Theatre.

The year 1942 in the theatre was notable more for its lapses than for its accomplishments. In subscribing in turn to the decision of the New York Drama Critics' Circle that no new American play was good enough for its award, the Pulitzer prize committee attested further to the season's dramatic poverty. The only two plays that were even momentarily considered by a minority of the Critics' Circle, John Steinbeck's *The Moon Is Down* and Howard Koch and John Huston's *In Time to Come,* were as quickly dismissed by that body—and presumably also by the Pulitzer committee—as being unworthy of its imprimatur. As the best foreign play to be produced on the American stage, the critics, though not unanimously, conferred their blessing upon Noel Coward's farce-comedy, *Blithe Spirit,* which signified little since its only contender was Patrick Hamilton's box-office melodrama, *Angel Street.*

Following Pearl Harbor, the theatre, coming into the year 1942, suffered a six months' period of relative doldrums and did not recover until, peculiarly enough, the summer, traditionally a slack season. Suddenly, a succession of musical and vaudeville shows brought a renewed life to the box office, which continued for the rest of the term and beyond. The successful re-emergence of vaudeville, in such exhibits as *Priorities of 1942* and *Show Time,* was one of the idiosyncrasies of the year. Another was the transference of burlesque from the lowly sidestreet stages, where it had been suppressed by the authorities as inimical to public morals, to the Broadway stage. Here, at fourfold prices, it went its old way for some time unmolested until censorship finally descended upon one of the shows, *Wine, Women and Song,* which was dispensed at relatively lower prices, and several weeks later under due process of law forced its shutdown. *Star and Garter,* which was old strip-tease burlesque at $4.40, was subsequently, after it had been operating for almost six months, compelled to a self-purification under threat of prosecution, and *Strip For Action,* which was a comedy based upon the activities of a burlesque troupe and vended at almost as high a price, was similarly worried into various deletions.

As for the better-known American playwrights, Eugene O'Neill was still conspicuous for his absence from the theatre, adhering to his determination not to allow productions of any of his several completed plays until the conclusion of the war. In the latter half of the season, William Saroyan produced on his own his two short plays, *Across the Board on Tomorrow Morning* and *Talking to You,* but his amateurish stage direction ruined any chances they might otherwise possibly have had. Subsequently, he permitted Eddie Dowling to produce his *Hello Out There* and the play's excellent qualities were given their full due. Maxwell Anderson followed his feeble war play, *Candle in the Wind,* with a very much better one, *The Eve of St. Mark;* Robert Sherwood, giving his services to the government, wrote nothing for presentation; Clifford Odets came a cropper early in the year with a fuddled triangle play with fuddled overtones, *Clash by Night;* and Ben Hecht failed abjectly with an allegorical ghost drama, *Lily of the Valley.* Marc Connelly was revealed at his weakest in *The Flowers of Virtue,* which drew a warning parallel between an incipient Hitler and the real article; Philip Barry, in *Without Love,* negotiated a very poor comedy as a vehicle for the popular Katharine Hepburn; S. N. Behrman, in *The Pirate,* based on an old German play by Ludwig Fulda, did little but provide the equally popular Lunts with a serviceable box-office show; and Thornton Wilder contrived a fantasy, *The Skin of Our Teeth,* also good box office, that amounted critically to a mere clever stunt.

With the acute shortage of good new play scripts, revivals of older plays were to be expected, and they duly came about. During the year, no less than 14 such dramatic revivals were produced for better or worse. They ranged from Chekhov's *The Three Sisters* to the farce *Three Men on a Horse,* from Sheridan's *The Rivals* to the Paul Green-Richard Wright *Native Son,* and from *Hedda Gabler* to John Drinkwater's *Bird in Hand,* Karel

Capek's *R.U.R.* and Elmer Rice's *Counsellor-at-Law.* There were musical revivals as well, among the lot *The Merry Widow, The New Moon, Porgy and Bess, The Chocolate Soldier* and *The Time, the Place and the Girl,* along with a heavy serving of Gilbert and Sullivan.

Despite the curtailment of gasoline, the little summer theatres fared pretty well, more than 70 operating throughout the east. The most popular plays with the rural audiences were, in the order named, *Watch on the Rhine, George Washington Slept Here, Jason, Private Lives, Out of the Frying Pan* and *You Can't Take It with You,* with *My Sister Eileen, Ladies in Retirement, Reflected Glory* and *Theatre* all tied for seventh place.

Unquestionably the most successful production made in the national theatre during the entire year was Irving Berlin's military show, *This Is the Army,* acted by men in the armed forces for the Army Relief fund. A thrilling exhibit, it was unanimously endorsed by the press and public and played to capacity audiences in the various cities where it was shown. It played to such enormous business, indeed, that it wrecked the box office for any other play that risked the same city at the same time.

The year witnessed a renewed activity on the part of amateurs, with few of them, however, producing anything of merit. The so-called American Youth Theatre put on two revues, *Of V We Sing* and *Let Freedom Sing,* both very poor. The Studio Theatre came uptown with a weak revival of Lessing's *Nathan the Wise,* after showing a still weaker dramatization of Tolstoy's *War and Peace* in its home quarters. The Blackfriars' guild presented *The Years Between,* by Edward Burbage, *Savonarola,* by Urban Nagle, and a couple of other equally feeble plays; and the Theatre Showcase group put on, among other things, a dramatization of a Gorki story, getting nowhere with it, although it deserved some credit for producing Saroyan's *Across the Board on Tomorrow Morning* before the author got around to showing it in the professional theatre. The notable exception was the chain of theatres in the so-called National Theatre Conference, to which Anderson contributed, gratis, the rights to his *The Eve of St. Mark.* More than 75 of these amateur groups produced the play, some contriving presentations that were more than usually competent.

The once esteemed Theatre guild, entering upon its 25th season, still further lowered itself in the public eye by arrogating to itself, on the occasion of its anniversary, major credit in having converted the American theatre from a purely commercial institution into one more or less receptive to fine dramatic art. Since a large share of that credit obviously belongs to others, as the critics were quick to point out, and since the guild in later years has been fully as commercially minded as the producers it inferentially condemns, its posturing was regarded as in particularly bad taste.

Among other things, as the critics observed, the guild from its very beginning has allowed other producers to discover and sponsor talent in playwriting, and has taken over such talent only when it has already been proved at others' expense.

The best ensemble acting of the year was that in the *Candida* revival, with a company including Katharine Cornell, Raymond Massey, Burgess Meredith and Dudley Digges. The play was given 27 performances for the benefit of the Army Emergency fund and the Navy Relief society. Among the more interesting of the 1942 individual performances in drama were Nicholas Conte's in *Jason,* Victor Kilian's in *Solitaire,* Flora Robson's in *The Damask Cheek,* Eddie Dowling's and Julie Haydon's in *Hello Out There,* Jessica Tandy's in *Yesterday's Magic,* Alfred Lunt's and Lynn Fontanne's in *The Pirate,* Bobby Clark's in the revival of *The Rivals,* Canada Lee's in the reproduction of *Native Son,* Judith Anderson's in the revival of *The Three Sisters,* and Tallulah Bankhead's in *The Skin of Our Teeth.* (G. J. N.)

Statistics of the Theatre in New York city, 1942 and 1941

	1942	1941
Productions	110	94
Musical comedies	26	20
Plays	84	74
Premières	73	69
Successful productions	17	21

Tickets sold	7,210,000	7,360,000
Approximate cost of productions	$2,250,000	$2,000,000
Number of shows booked for other cities	94	106

(X.)

Great Britain.—The surprise of the year in the British theatre was the readiness with which the public accepted war plays. Not romantic war plays, not the spy-and-thrill stories which were popular during World War I, but genuine efforts to state in terms of theatre the emotions and ideals of the dreadful hour. The first in the field, *The Morning Star,* in which Emlyn Williams was author, actor and producer, held its place in the West End for a year.

Other successes of this type were *The Watch on the Rhine,* an American study of the war between nazi and anti-nazi relentlessly pursued overseas, and *Flare Path,* an R.A.F. play by Terence Rattigan in which the horrors of aerial warfare were austerely mingled with some humours of the airman's life on earth.

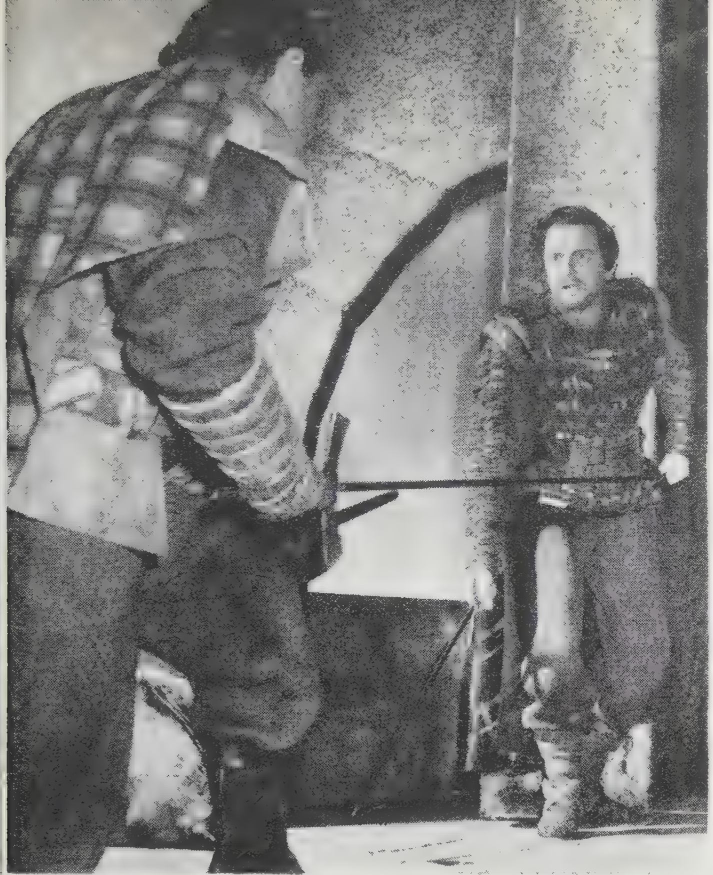
Shakespeare turned out to be obstinately popular. John Gielgud toured the country triumphantly and had a London season with *Macbeth,* while the "Old Vic" did the same with *Othello* and some of the famous comedies. Donald Wolfit was rapidly building up for himself a position as a leader of classical revivals on tour, and Robert Atkins, so well known for his open-air productions in Regent's park every summer, during 1942 had initial Shakespeare seasons in the parks of Manchester and the East End of London and these, despite uncertain weather, were very widely supported. Much of this Shakespearean work was done in connection with C.E.M.A., the Council for Encouragement of Music and the Arts which was created at the beginning of the war by a grant from the Pilgrim trust and was later adopted by the government as a vehicle for state support of the arts. Its contribution to the drama so far had mainly been the assisting of first-rate tours in regions unused to receiving them, and the taking to industrial and mining areas of drama and music of the highest calibre.

Noel Coward gave part of his time to the making of a much-approved navy film *In Which We Serve,* but found occasion to compose two new plays and to act in and direct them himself. These, along with his universally popular comedy *Blithe Spirit,* he took out on tour in the autumn. They were not seen in London in 1942.

There was considerable prosperity in the entertainment world, despite the heavily increased entertainment tax. The large numbers of U.S. and Imperial troops in the country added to the potential audience and they did not patronize the light shows only. Many who could made a trip to Stratford-on-Avon where, despite all the traffic and transport difficulties, a very successful season was again held. Naturally audiences of this kind were greatly attracted by film names since these have international currency, and Shaw's *The Doctor's Dilemma* drew huge audiences in and out of London for well over a year, a major cause of this being undoubtedly the appearance of Vivien Leigh in the part of Mrs. Dubedat.

J. B. Priestley contributed a light comedy on broadcasting and another piece called *They Came to the City.*

Musical shows were well maintained, despite the difficulties in casting and mounting them, and throve abundantly when they had first-rate artists such as Leslie Henson, Jack Hulbert, Cicely Courtneidge and Beatrice Lillie to assist them. There were abundant revues and the standard of writing and performance remained commendably high. Herbert Farjeon further confirmed his position as a leader of witty writing. (I. Br.)



THE FIRST SUCCESSFUL PRODUCTION of *Macbeth* in New York city, starring Maurice Evans (right), ran for 17 weeks on Broadway during the 1941-42 season before touring the U.S.

GYPSY ROSE LEE, strip-tease dancer and author, and Bobby Clark were the featured players of *Star and Garter,* a glorified burlesque show of 1942 on Broadway

WOODROW WILSON was the hero of *In Time to Come,* a 1941-42 U.S. drama about the League of Nations, by Howard Koch and John Huston. This scene shows Wilson (second from left, played by Richard Gaines) en route to Europe

MAXWELL ANDERSON'S *The Eve of St. Mark,* first drama of U.S. soldiers in action in World War II, opened in New York city in Oct. 1942

PAUL ROBESON in 1942 became the first Negro in the U.S. to play Shakespeare's Othello. The production, with Jose Ferrer as Iago (background) and Uta Hagen as Desdemona, was taken on summer tour

Tibet. A country of central Asia, lying N. and N.E. of the Himalayas, mainly a high tableland. Nominally a Chinese dependency, it is in practice independent. Area, about 450,000 sq. mi.; estimates of the population vary, but 2,000,000 is a probable figure. The religion is Lamaism, a late form of Buddhism modified by animism and primitive magic, and education is in the control of the many monasteries. The ruler is the 14th dalai lama (born 1933) enthroned in 1940 as Lingerh Lamutanchu.

The geographical isolation and undeveloped condition of Tibet were no doubt the main factors in keeping it out of the actual theatre of war during 1942. Its proximity to China, however, and its possible use as a supply line to that country after the Burma road had fallen received consideration. According to a statement made on June 25, 1942, it was understood that the British and Chinese governments had made representations in the capital city, Lhasa, about the development of pack transport routes between India and China through Tibet.

Timber: *see* LUMBER.
Timor: *see* PORTUGAL; PORTUGUESE COLONIAL EMPIRE; WORLD WAR II.

Timoshenko, Semyon Konstantinovich (1895–), Russian army officer, was born in Furmanka, Bessarabia, of peasant parents. He joined the Red army during the revolution of 1917, winning renown as a guerrilla leader. After the revolution, he studied strategy in soviet military academies, and from 1935 to 1938 he commanded a number of Russian military districts. During the Russo-Finnish conflict, 1939–1940, Timoshenko built a replica of the Mannerheim line just behind Russian positions and had his troops rehearse every operation before attacking the Finnish chain of fortresses. On May 8, 1940 he was appointed people's defense commissar and was given the rank of marshal, but he was transferred from this post July 20, 1941, and took active command of Russian armies on the western zone of the German-Russian front. On Oct. 23, 1941, he was shifted to the southern front; a month later he opened a surprise offensive, recaptured Rostov and Taganrog and routed the German armies of Gen. von Kleist. Timoshenko's brilliant coup paved the way for Russian offensives along the entire Russo-German front.

Timoshenko was transferred from his command during the German drives into the Caucasus and Stalingrad sectors in July 1942 and was succeeded by Gen. Georgi Zhukov. It was later learned that Timoshenko was assigned to command Russian armies on the Leningrad front.

Tin. War demand increased world tin output to a new high record in 1940, at 237,800 long tons, 28% over the 1939 figure, and 13% over the former high of 1937. While results are uncertain because of incomplete data, it seems that there was some further increase in 1940, as indicated in the accompanying table, though the figures presented for 1941 are not in all cases actual production, but exports from the country, and in no case but Bolivia cover the full year, all others being based on data for ten or eleven months; considering possible variations, a figure of 250,000 tons seems about as close as can be expected for the year, though this may be in error by several thousand tons in either direction. No data whatever have been received for 1942, from any country.

The sources of supply for the United Nations were badly disrupted by the loss of Burma, Malaya and Netherlands East Indies, which, with Thailand and Indo-China, accounted for two-thirds of the world supply. As a result, production was being expanded elsewhere, if this were possible, and stringent economies in use were ordered. The United States has been the world's largest user of tin, and having received the bulk of its supply from Malaya and Netherlands East Indies, the position was rendered particularly acute. In order to offset these difficulties so far as possible, several small private tin smelters were started in the United States, and the government built a much larger plant, to be supplied mainly by ore from Bolivia. These plants had a combined capacity that was probably not more than half of the consumption demand of the country, so that strict economy in the use of the metal had to prevail, even if ores could be secured to keep the plants running at full capacity. Nothing was known in 1942 of the current status of imports of either ore or metal, since no statistics were published after those for the first nine months of 1941, which included 16,570 long tons of tin in ore and 114,181 tons of metal, the latter being only 8% less than the total for all of 1940.

World Production of Tin
(Long tons)

	1937	1938	1939	1940	1941
Belgian Congo . .	8,900	7,300	9,700	12,500	13,000
Bolivia	25,100	25,400	27,200	37,900	42,740
China	10,500	11,200	10,900	?	?
Dutch E. Indies. .	39,800	21,000	31,400	44,400	53,000
Malaya	77,500	43,200	56,000	85,400	81,000
Nigeria	10,500	7,300	10,900	10,300	14,800
Siam	16,500	13 500	17,000	17,400	16,200
World total . . .	209,100	149,700	184,300	237,800	250,000

Ceiling prices set by the Office of Price Administration in Aug. 1941 were continued throughout the year—52 cents for Grade A, 51 cents for 99%, and intermediate prices for intermediate grades. The official maximum price in London was £275 per long ton for 99% metal. (*See* also METALLURGY; MINERAL AND METAL PRICES AND PRODUCTION; WAR PRODUCTION, U.S.)

(G. A. Ro.)

Tinker, Clarence Leonard (1887–1942), U.S. army officer, was born Nov. 21 near Edgin, Kan. He was graduated from Wentworth military academy, Lexington, Mo., in 1908 and became a second lieutenant in the Philippine constabulary. In 1912, he was appointed second lieutenant in the regular army. During World War I he served at home and later was professor of military science. After graduating from the command and general staff school in 1926, he served as an officer at various army airfields. In 1940, he was designated an air corps wing commander. After the attack on Pearl Harbor and the resultant shakeup in the army command, Tinker was promoted to major general in Jan. 1942 and was given command of the Hawaiian air force. He was reported lost June 7, 1942, during the Battle of Midway, when he personally led a flight of army bombers from Midway island to attack a Japanese fleet east of Wake island.

Titanium. Imports of titanium ores into the United States, mostly from India, were 156,737 tons of ilmenite and 980 tons of rutile, which is approximately the same rate as in 1940, but shortage of shipping space and the uncertain conditions prevailing in the main producing area led to the installation of a plant for the treatment of the titanium-iron ores of Essex county, New York, which was planned to have a capacity of 800 tons daily of ilmenite concentrates. Imports from Brazil were increasing, but were still so small as to be negligible. (G. A. Ro.)

Tobacco. The tobacco crop in the United States in 1942 was estimated by the department of agriculture as 1,-

U.S. Production of Tobacco by States, 1942 and 1941

State	1942 lb.	1941 lb.	State	1942 lb.	1941 lb.
No. Carolina.	585,700,000	459,490,000	Florida . . .	14,288,000	11,711,000
Kentucky . .	284,773,000	294,130,000	Massachusetts	9,065,000	9,781,000
Virginia . . .	106,528,000	88,572,000	Indiana . . .	8,478,000	8,431,000
So. Carolina .	96,750,000	69,660,000	Missouri. . .	5,355,000	5,400,000
Tennessee . .	87,500,000	86,345,000	West Virginia	2,850,000	2,610,000
Georgia . . .	59,860,000	55,430,000	New York. .	1,475,000	1,700,000
Pennsylvania	49,100,000	58,182,000	Minnesota. .	720,000	705,000
Maryland . .	30,020,000	30,225,000	Kansas . . .	285,000	300,000
Wisconsin . .	29,200,000	31,640,000	Alabama . .	235,000	305,000
Ohio	23,948,000	25,311,000	Louisiana . .	100,000	57,000
Connecticut .	20,958,000	22,890,000			

417,188,000 lb. from 1,380,300 ac., as against 1,262,885,000 lb. from 1,308,100 ac. in 1941 and a ten-year (1930–39) average of 1,398,796,000 lb. from 1,676,280 ac. The goals for 1943 were the same acreage for each type of tobacco as in 1942 except that the Burley acreage was to be increased 10%. As announced in Dec. 1942 by Sherman E. Johnson, chief of the production and supplies branch, Office for Agricultural War Relations, such an acreage of tobacco in 1943 would achieve a balanced production in relation to other crops and would not "make unnecessary claim upon land and workers needed for the production of products immediately essential to the war effort." The 1943 goal for Burley tobacco was announced as 421,350 ac.

Production of different types of tobacco in the United States in 1942 was: 824,115,000 lb. of flue-cured tobacco from 791,900 ac., compared to 649,542,000 lb. in 1941 from 717,600 ac. and a ten-year average of 751,773,000 lb. from 924,750 ac.; fire-cured 72,831,000 lb. in 1942 from 75,300 ac., 70,182,000 lb. in 1941 from 75,100 ac. and a ten-year average of 125,844,000 lb. from 158,700 ac.; light air-cured (Burley) 361,025,000 lb. from 390,600 ac. in 1942 compared to 368,017,000 lb. from 382,800 ac. in 1941 and a ten-year average of 355,571,000 lb. from 441,850 ac.; dark air-cured 32,450,000 lb. from 32,600 ac. in 1942 and 31,455,000 lb. from 32,600 ac. in 1941, the ten-year average 42,138,000 lb. from 50,970 ac.; cigar filler types 60,576,000 lb. from 43,800 ac. in 1942 compared to 71,877,000 lb. from 48,000 ac. in 1941 and a ten-year average of 57,535,000 lb. from 49,870 ac.; cigar binder types 56,907,000 lb. from 36,400 ac. in 1942 compared to 61,619,000 lb. from 41,000 ac. in 1941 and a ten-year average of 56,910,000 lb. from 40,700 ac.; cigar wrapper types 126,667,000 lb. in 1942 from 89,700 ac., 143,632,000 lb. in 1941 from 99,800 ac. and a ten-year average of 123,059,000 lb. from 99,350 ac.; Louisiana Perique 100,000 lb. in 1942 from 200 ac., 57,000 lb. from 200 ac. in 1941 and a ten-year average of 181,000 lb. from 420 ac.

The 1942 acreage of tobacco in Canada was about 6% more than the 70,560 ac. of 1941, most of the increase being in the flue-cured area of Ontario, where the 55,000 ac. was 12% more than the 1941 acreage but 11% less than the allotment for 1942. The Cuban 1941–42 crop was estimated at 40,000,000 lb., about the same as in 1940–41. The Argentine crop of 32,700,000 lb. was about 18% less than the 1941 crop, while the Brazilian crop of 200,000,000 lb. was about the level of the 1941 crop. Turkey had in 1942 the largest crop, 153,000,000 lb., since 1927, and comparable to 122,000,000 lb. in 1941. Germany, which consistently competed for Turkish tobacco, objected to the high prices asked for the 1942 crop. In India, where contingents of United States soldiers were stationed in 1942, the tobacco industry made a planned effort to produce cigarettes of U.S. type, using light Virginia type leaf for that purpose. (S. O. R.)

Todt, Fritz

(1891–1942), German engineer, was born Sept. 4 at Pforzheim, Germany. During World War I, he was an officer in the air force and was chief engineer of the department of roads, 1928–1933. After Hitler became chancellor in 1933, Todt was made inspector general of roads. He was also commissioned by the reichswehr to begin construction of a gigantic defense line on Germany's western frontier that was designed to offset the Maginot line across the French border. In addition, he designed and directed construction of the German network of broad superhighways that facilitated the movement of Hitler's mechanized armies throughout the reich. The great speed with which Germany conducted its blitzkrieg drives was attributed in large measure to the system of communications and supplies organized by Todt, who was appointed minister of armaments and munitions in March 1940. After the Polish campaign, Todt was made a major general and immediately started to rebuild Poland's auto roads, which were used extensively to speed supplies and men to the eastern front in the Russo-German war. In Aug. 1941 he was appointed inspector general for water and power with the rank of reich minister. A Berne dispatch dated Feb. 8 said Gen. Todt apparently met his death while flying back to Germany from the Russian front.

Tojo, Hideki

(1884–), Japanese army officer and statesman, was born in Tokyo, the son of Gen. Eikyo Tojo, master strategist of the Russo-Japanese war of 1904–05. A graduate of the Military Staff college, in 1915, he went to Germany in 1919 as military attaché and studied military strategy. On Oct. 18, 1941, Tojo, then a lieutenant general, became premier after Prince Konoye resigned under a bombardment of criticism for his failure to better relations with the United States without sacrificing Japan's ambitions to create a "new order" in the far east. Tojo also took over the war and home ministry portfolios. A grim foreboding of war between the U.S. and Japan was seen in his first public statement that Japan would settle the far east crisis "by quick action, not words." On Dec. 13, 1941, six days after Japan attacked Hawaii, Tojo said Japan was "fighting in self-defense and the cause of righteousness." Tojo was not lured into over-optimism by Japan's easy conquests in early 1942 and on Nov. 30, he admitted that there were "still difficulties to overcome in our future path." On Dec. 27, he warned that the "real war is starting now" and that he expected the Allies would deliver counterblows of "great importance."

Tokyo.

The capital and largest city of Japan. Pop. (1940) 7,001,460; area, 257 sq.mi.; situated at 35° 41′ N. and 139° 45′ E. at the head of the bay of the same name on the southeast coast of Honshu, largest of the principal Japanese islands. Almost 10% of the population of Japan lives in Tokyo, which is at once a political centre, a major industrial city and the seat of many of Japan's institutions of higher learning. There were 1,029,695 buildings and dwelling houses in the city at the end of 1937.

Tokyo is an independent self-governing municipality, with a city council and board of aldermen and a mayor at the head of the administration. The municipal budget for 1939–40 was 256,394,000 yen. The latest educational census available in 1942 listed 1,906 elementary and middle schools in Tokyo, with 1,118,399 pupils. There were 104 higher schools, including 22 universities, with 107,302 students. The Imperial university has the highest prestige among the Tokyo universities and is a recognized training school for future high officials and diplomats.

At the end of 1936, Tokyo contained 29,633 small workshops, employing less than 5 operatives, with a total of 47,251 workers and 14,329 larger factories, employing 403,095 workers. The growth of munitions production undoubtedly led to a considerable expansion of these latter figures in the years following.

Tokyo is built on hills and has a port in its own right, although large ocean liners dock at Yokohama, with which Tokyo is connected by railway. It is one of the few large cities in the world where there is no regular system of numbering houses. Never a very gay city, it became more austere with the progress of war. Severe restrictions were imposed on dancing, and the use of private cars and taxicabs was greatly curtailed because of the shortage of gasoline. U.S. planes under the command of General James Doolittle (*q.v.*) carried out a surprise raid on Tokyo April 18, 1942. Apart from this episode, the Japanese capital had not been directly touched by the war by the end of 1942.

(W. H. Ch.)

Tomatoes.

The United States tomato crop for processing in 1942 was estimated at 3,152,700 tons, compared with 2,802,200 tons in 1941 and a ten-year (1931–40) average of 1,634,800 tons. In addition, the 1942 crop for fresh marketing was 26,425,000 bu. compared with 24,075,000 bu. in 1941 and a ten-year average of 22,130,000 bu. The 1942 production was the highest on record and also resulted in a record tomato pack. The government required for military and lend-lease purposes 33,000,000 cases of whole tomatoes, 24 No. 2 cans to the case; 23,000,000 cases of tomato juice and 3,000,000 cases of tomato pulp and puree. The proportions of the 1942 pack and of government requirements could be better appreciated when it was realized that for the five years from 1937 to 1941 the tomato pack averaged 27,000,000 cases of whole tomatoes, 16,100,000 cases of tomato juice and 3,100,000 cases of pulp and puree. Although the government's tin conservation orders severely restricted the pack of certain vegetables, no limits were set on tomatoes. The government estimated its requirements for 1943 as 15,000,000 cases of whole canned tomatoes, 9,900,000 cases of tomato juice and 2,100,000 cases of pulp and puree. The area planted to tomatoes for processing in 1942 was 590,070 ac. It was 460,450 ac. in 1941; the ten-year average was 372,800 ac. The planting for fresh market in 1942 was 220,230 ac. compared to 198,730 ac. in 1941 and a ten-year average of 192,500 ac. (*See* also Market Gardening; Truck Farming.)

Toronto.

Second largest city of Canada and capital of the province of Ontario, Toronto had a population of 660,000 in 1942 and an area of 34 sq.mi. Lines of the two Canadian railways and excellent motor highways radiating from the city make it easy of access to all parts of the province of Ontario, the two adjacent provinces of Quebec and Manitoba and border points in the United States. Toronto enjoys good air service through transcontinental and local lines. Always largely concerned in the mining industry and in the manufacture and distribution of goods, it had turned most of its production facilities by 1942 to the purposes of war and its savings to the purchase of Victory bonds and War Savings certificates. A very large number of its men and women were in the armed forces, and many more were engaged in the arduous work of keeping up the supply of necessary munitions and other war material. In spite of all this dislocation, gladly suffered, the importance of Toronto as a business centre was being maintained, and the city-owned street railways and bus lines and hydroelectric distributions and other municipal services were functioning well. Towers, John H.

(1885–), U.S. naval officer, was born in Rome, Ga., January 30, and was graduated from Annapolis in 1906. One of the first men to qualify for naval aviation in 1911, he established a world's record endurance flight in a seaplane in 1912, and was assistant director of naval aviation during World War I. His competence in aviation was quickly recognized and in May 1919 he organized and led a unit of flying boats that made the first trans-Atlantic flight in history. He was assistant chief of the navy department's bureau of aeronautics, 1929–31, was commanding officer of the United States aircraft carrier "Saratoga," 1937–38, and was made chief of the bureau of aeronautics in June 1939. In the same month, he was made a rear-admiral. Adm. Towers was long an advocate of naval air expansion and was in the vanguard of the air-minded officers who fought for a vast naval air expansion program. In Sept. 1942, he was promoted to rank of vice admiral and given command of the Pacific fleet air force.

Town and City Planning.

In the United States the establishment and extension of war industries brought about acute congestion in such areas as Norfolk, Va.; Washington, D.C.; southern Michigan; Mobile, Ala.; Wichita, Kan. and Pacific coast communities from Seattle to San Diego. Many of the war plants were located by federal authorities without benefit of the advice of local city planning commissions. In cases where the factories and housing projects were to be permanent, the war was expected to leave complicated problems for the local planning authorities to solve. In the case of temporary buildings there would be difficulties in clearing the ground and putting the land to some constructive use.

The year 1942 in the United States was expected to be remembered in city planning annals for the proposals for urban redevelopment. The *Handbook on Urban Redevelopment for Cities in the U.S.*, issued late in 1941 by the Federal Housing administration, was discussed and was succeeded during 1942 by a pamphlet on *Urban Redevelopment and Housing,* published by the National Planning association and containing the plan of Messrs. Greer and Hansen of the Federal Reserve system; and by *A Proposal for Rebuilding Blighted Areas,* put out by the Urban Land institute. Charles T. Stewart, director of the Urban Land institute, described all of these plans in the October *Planning and Civic Comment.* Practically every city in the U.S. had permitted blighted areas to grow up in the central districts. These areas were served with streets and utilities and should have been contributing to the comfort and convenience of the citizens. There was some difference of opinion about the methods to be employed in assembling the land, replatting it and putting it again into use. It was a question whether the land should remain in public ownership and be leased to private developers or whether it should be resold with restrictions which would prevent a recurrence of the blight process in the future. But the recommendation that cities undertake, possibly with federal and state aid, to provide better planned neighbourhoods which would give all citizens sanitary living quarters served with educational and recreational facilities, definitely appealed to the imagination of the American people, especially as they considered projects to be undertaken in the postwar period when the war industries and the armed forces would be demobilizing the millions employed in the war effort.

The National Conference on Planning, sponsored by the four planning organizations, met in May of 1942 at Indianapolis, Ind., where there were more than a thousand delegates in attendance. The newly organized Indiana Civic association stimulated a wide popular interest in the conference and in planning.

In England three official reports were issued on national planning with recommendations which definitely would affect local planning and the pattern of living. The Barlow, Scott and Uthwatt reports recommended the establishment of a central planning agency which would bring about a distribution of the population through decentralization and limitation of the size of cities and towns, possibly through surrounding country belts. The large urban areas destroyed by war operations must be rebuilt and British authorities were looking toward the replacement of former crowded areas with neighbourhoods where families might live in sanitary houses surrounded by gardens. (*See* also HOUSING.)

Track and Field Sports.

Track and field competition of 1942 was a tale of two nations —the United States and Sweden. The United States contributed Cornelius Warmerdam, No. 1 in a long line of fine California pole-vaulters, and J. Gregory Rice, ex-Notre Dame distance runner, as the western hemisphere's two standouts. Warmerdam picked up his record-breaking trail of 1941 to establish world pole-vault records for both indoor and outdoor competition. Rice, foremost U.S. trackman of the previous two years, marked his 1942 performances with eight A.A.U. records at distances from two-and-a-quarter to three miles.

Sweden gave the world two of 1942's finest track performers—Gunder Haegg (or Hagg) and Arne Andersson. Haegg produced seven world distance records. His distance running-mate, Andersson, combined with Haegg to give Sweden the strongest two-man running strength in the history of track.

Warmerdam, having found a ceiling of 15 ft. $5\frac{3}{4}$ in. in 1941, raised it to 15 ft. $7\frac{3}{4}$ in. outdoors and 15 ft. $7\frac{1}{4}$ in. indoors. The California school teacher cleared 15 ft. on 16 different occasions during the winter indoor season. Rice easily stood out among the distance runners in the United States, both indoor and outdoor. He highlighted the A.A.U. indoor championship with a world record-shattering performance of 13:45.7 in the three-mile. It was the 48th straight victory for the former Notre Dame athlete.

CORNELIUS WARMERDAM making his record-breaking pole vault of 15 ft. $7\frac{1}{4}$ in. at Boston, Mass., Feb. 14, 1942

GILBERT DODDS, Boston divinity student, winning the 1,500-metre run at the National A.A.U. meet in Triborough stadium, New York city, June 20, 1942. His time was 3:50.2

Even more amazing, however, were the times recorded by Haegg during Sweden's outdoor season. The 25-year-old Swedish sensation set seven world records in 74 days and unofficially in 1942 held all records ranging from 1,500 m. to 5,000 m. Haegg ran the mile in 4:04.6, which was 1.8 sec. below the recognized world record of Great Britain's Sydney Wooderson, set in 1937. His other records, some of which lowered the previous world marks by as much as 10 sec., included: 1,500 m., 3:48.8; 2,000 m., 5:11.8; 3,000 m., 8:01.2; two miles, 8:47.8; three miles, 13:32.4; 5,000 m., 13:58.2.

Andersson's performances were generally obscured by those of Haegg, although the former recorded such outstanding times as 4:06.4 in the mile, equalling Wooderson's accepted world record. A move was made to bring the two Swedish runners to America during the summer, but the war prevented it. International hostility also forced cancellation of the Pan-American games, a modified Olympic games which would have involved North and South America trackmen in a meet at Buenos Aires, Argentina.

Harold Davis of the University of California was the year's most consistent "doubles" winner. He captured the 100- and 220-yd. dashes in the National Collegiate championships, and then followed with victories in the A.A.U. outdoor 100- and 200-m. dashes. Davis produced a world record-equalling 9.4 sec. in the 100-yd. dash, but the mark was not accepted because of questionable starting blocks. In winning the 200-m. dash, Davis became one of six repeaters in the A.A.U. outdoor championships. Others were: Rice, five straight in the 5,000-m.; Al Blozis, three straight in the shot; Warmerdam, four in the pole vault; Billy Brown, four straight in the broad and triple jumps, and Boyd Brown, four straight in the javelin. Warmerdam's vault of 15 ft. $2\frac{1}{2}$ in. set a new A.A.U. outdoor record, while Frank Berst of the New York Athletic club broke a 31-year-old mark in the 56-lb. weight throw with a toss of 39 ft. $3\frac{1}{4}$ in.

The University of Southern California again dominated the National Collegiate track and field meet to annex its eighth straight N.C.A.A. title. Only two N.C.A.A. defending champions repeated in 1942, Blozis of Georgetown winning the shot in 54 ft. $9\frac{5}{8}$ in. and Robert Wright of Ohio State taking both hurdle events, the highs in 14.2 sec. and the lows in 23.7 sec. Southern California continued its track reign of the Pacific coast with its seventh consecutive conference championship. Ohio State won the Western conference meet, and Penn State topped the East with team victories in both the I.C.4-A. indoor and outdoor championships.

Indoor Track.—Twelve world records were shattered. New indoor marks were established in the 440 yd., 400 m., 500 yd., 800 m., 880 yd., 1,000 m., three mi., pole vault, shot put, sprint medley relay, mile relay and two-mile relay.

Gilbert Dodds, a 23-year-old divinity student from Boston, in the National A.A.U. indoor championships outlasted Leslie MacMitchell, champion in 1941 and the 1941 Sullivan Award winner as America's outstanding amateur athlete, to win the mile in the fine time of 4:08.7. It was MacMitchell's first defeat in 20 starts.

Rice was at his best in the national indoor meet. Not only did he break the world record for the three-mile run at 13:45.7, but he recorded new marks at the 2, $2\frac{1}{4}$, $2\frac{1}{2}$ and $2\frac{3}{4}$ mi. enroute. Blozis, the 240-lb. Georgetown university giant, tossed the shot 57 ft. $\frac{3}{4}$ in., only a quarter of an inch behind Jack Torrance's world record. Blozis' bid for an indoor record, however, was disallowed when a checkup revealed the missile was slightly under the required 16-lb. weight.

New York A.C. won the National A.A.U. indoor team championship, which, with its outdoor title, gave it a sweep of the two senior A.A.U. championships. Penn State captured the intercollegiate indoor title with 21 7/10 points as compared to Fordham's 20 7/10.

Miscellaneous.—Joe McCluskey, a lieutenant (j.g.) in the U.S. navy reserve, returned to the cinders twice during 1942 to win the National A.A.U. 10,000- and 15,000-m. runs. The victories brought McCluskey's senior championships to 23, a new record. He started winning A.A.U. titles in 1930.

John Borican, after years of trying, finally won the A.A.U. outdoor 800-m. championship, defeating such strong competitors as William Lyda, the N.C.A.A. champion; Charles Beetham, a four-time winner, and Campbell Kane, Indiana's fine middle-distance runner. Six months later, on Dec. 22, Borican died of what physicians diagnosed as pernicious anaemia.

Outstanding high school performer of the year was Dwight Eddleman of Centralia, Ill. Eddleman's high jump mark of 6 ft. $6\frac{3}{4}$ in. placed him in a tie for third among the best performers of 1942. He jumped 6 ft. 6 in. in an exhibition during the Western Conference-Pacific Coast dual meet, while the best the collegians could do was 6 ft. 4 in. Eddleman enrolled at the University of Illinois after finishing high school.

Indiana university won the National Collegiate cross-country championship, while Oliver Hunter III, of Notre Dame, was crowned individual champion. Frank T. Dixon III, of New York, won the National A.A.U. cross-country title.

Women.—Completing a ten-year span of U.S. women's track and field supremacy, Stella Walsh topped a strong field in the National A.A.U. track and field championships with firsts in the 200-m. dash, discus and broad jump. The Polish-American athlete first rose to national prominence by dominating the sprint events of the 1932 Olympic games at Los Angeles. Tuskegee institute, an Alabama Negro school, won the team title for the sixth straight year with 80 points. Miss Walsh's Polish Olympic A.C. was second with 64½ points, 30 of which were contributed by the 32-year-old Cleveland woman.

Best U.S. Track and Field Performances (Outdoor), 1942

100 Yards

9.4 sec.—Davis, California (World record)
9.5—Hammond, Ohio State; Joggerst, Missouri; Smith, San Jose; Ewell, Penn State

Trailer Coaches.

Production of trailer coaches in 1942 probably exceeded by a substantial margin the output of any previous year. Practically all manufacturers were producing at full capacity, and many of them were on a 24-hour working schedule.

The augmented production was due largely to the demand for emergency housing of war workers. It had become generally recognized that the trailer coach was an ideal solution for temporary or semi-permanent homes.

Manufacturers were handicapped by shortages in some critical materials, a situation which made it necessary to revise specifications and to substitute materials. Such substitutions, in general, were effected without any sacrifice of quality, durability or good appearance. Another problem was encountered in the withdrawal of new tires as trailer equipment; ultimate deliveries were usually made without tires.

The trend in design and types of trailer coaches naturally was influenced by the fact that they were being used for housing purposes. The result was increasing emphasis on comfortable living, the maximum of convenience and utility, improved heating and insulation, etc. Extensive trailer parks were established in war plant areas, many under government ownership and administration, and others under private ownership and management.

A large percentage of the trailer production in 1942 also went to the armed forces for specialized purposes. Trailers were used by the army, air corps, navy and marine corps for mobile field units, offices and officers' headquarters, radio stations, field laboratories, field hospitals, radio stations, photographic laboratories and other needs.

Effective Oct. 1, 1942, a government order prohibited the sale of new trailer coaches by the manufacturers or dealers to the public. No builder could produce trailer coaches except those ordered by government departments or agencies, and conforming to rigid government specifications. (P. E.)

Trans-Jordan.

Trans-Jordan lies to the east of Palestine, bounded on the north by Syria, on the northeast by Iraq, on the southeast and south by Saudi Arabia.

It is an Arab principality which, under a local Arab administration, forms part of the British-mandated territory of Palestine (*q.v.*). Like the land west of the Jordan, it continued in 1942 under the supervision of the British high commissioner for Palestine and Trans-Jordan, Sir Harold Alfred MacMichael, represented in Trans-Jordan by a British resident, Alec S. Kirkbride. The prince of Trans-Jordan is Emir Abdullah ibn Hussein; the prime minister (1942), Tawfiq Abdul Huda. Area: 34,740 sq.mi.; pop. *c.* 350,000. Religion: Mohammedan, with about 30,000 native Christians. Capital, Amman, the ancient Rabbat Ammon. Chief cities: Amman (25,000), Es-Salt, Maan.

History.—During 1942 the country continued to be an important bulwark of the British efforts to consolidate the middle eastern front against any expansion of axis influences. Emir Abdullah adhered faithfully to all his treaty obligations, and under his influence the Arabic tribes of the country remained loyal to their alliance with Great Britain. The emir and his government expected that after the war and Allied victory the position of the Arabs would be strengthened and their aspirations for unity and independence fulfilled. The successful defense of Egypt by the British assured Trans-Jordan of the tranquillity needed for the development of its economic resources and for the consolidation of its administration.

Defense, Finance, Education, Communication.—The defense forces of the country were organized in the Arab legion with 47 officers and 1,577 men, and the Trans-Jordan Frontier Force consisting of some 700 men. For 1940–41 revenue amounted to £388,455, to which grants in aid of £95,110 were added. The expenditure of the country in the same year amounted to £465,807 on the ordinary and £44,766 on the extraordinary budget. The value of the local currency is identical with British currency. £27,874 was spent by the government on education, but there were in addition numerous private schools. The public debt amounting to £155,107 in 1942 was insignificant, but the economy of the country was still very primitive. The Hejaz railroad runs through the country from north to south, but it is of less importance than the 1,400 mi. of good motor roads, connecting the country with Palestine, Syria and Iraq. (H. Ko.)

Trap-shooting.

Marksmen from the state of Illinois gained the majority of men's trap-shooting titles during 1942. James F. Holderman, a 32-year-old farmer from Morris, Ill., won the Grand American handicap in a shoot-off with Arthur Finney of Mankato, Minn. He scored a possible 25 in the shoot-off to Finney's 23, after each had tied in regular competition with 193 out of a possible 200. Joe Moore of Kewanee, Ill., was crowned champion of champions with a perfect performance in a 50-target shoot-off. Homer Clark, of Alton, added further to Illinois' dominance by winning the professional championship. Still another title went to Illinois when William Drennan, of Utica, won the North American championship with 25 straight in a shoot-off after scoring 199 by 200 in the regulation test. Julius Petti of England, Ark., won the all-around championship with 910 out of a possible 950, while Rudy Etschen, Kansas City, won the doubles with 94 out of 100.

The south dominated clay-bird breakage in women's competition. Carolyn Elliott, 19-year-old Vanderbilt university coed of Nashville, Tenn., won the women's Grand American handicap in a shoot-off with Mrs. Donald McClain of Atlanta, Ga. After each broke 183 out of 200, Miss Elliott won the title with 24 to Mrs. McClain's 23 in the extra firing. Mrs. George Cameron of Houston, Tex., captured the North American women's championship with a perfect 25 in a shoot-off with Mrs. Lela Hall of Strasburg, Mo., 24, and Mrs. Isaac Andrew, Spartanburg, S.C., 22. Mrs. Hall won the champion of champions with 198 out of a possible 200.

Dr. LeRoy Childs of Lake Kerr, Fla., won the national all-gauge skeet shooting championship with a possible 250. H. L. Brown, San Antonio, Tex., topped the national 20-gauge skeet shoot with a possible 100, while L. S. Pratt, Indianapolis, 99 by 100, won the 28-gauge and Pvt. Dick Shaughnessy, Harlingen, Tex., 96 by 100, won the 410-gauge. Women's national skeet champions of 1942 were: High over all, Mrs. Harriet Behrend, Erie, Pa., 516 by 550; all-gauge, Mrs. M. S. Smythe, Aurora, O., 248 by 250; 20-gauge, Mrs. L. W. Childs, Lake Kerr, Fla., 97 by 100; 28-gauge, Mrs. S. E. Hardy, Peoria, Ill., 96 by 100; 410-gauge, Mrs. Harriet Behrend, Erie, Pa., 89 by 100. Troy, John Weir (1868–1942), U.S. politician, was born Oct. 31 in Dungeness, Wash. He started as a reporter at the age of 18 and rotated his newspaper experience with jobs as county clerk and auditor. Caught in the Klondike gold rush, Troy landed a job as manager of a pack train. He stayed on in Alaska as editor of an Alaskan newspaper, later founded a short-lived magazine, and in 1913 became editor of the *Daily Alaska Empire* in Juneau, a newspaper which he purchased the following year. Six times Alaskan delegate to the National Democratic convention, he was chairman of the Democratic Alaska Territorial committee, 1932–34. He served as governor of Alaska, 1933–39. Troy died in Juneau, May 2.

Truck Farming. The 11 principal truck crops grown in the United States for processing yielded 5,760,000 tons in 1942. This was 13% above the 1941 production and resulted in a record pack of canned vegetables, with the exception of canned beans and soups. The larger crop, however, did not depress prices, because large military and lend-lease requirements, plus domestic buying power, created a demand that raised prices to growers about 35% over those of 1941. The acreage harvested in 1942 was 1,945,000 ac. compared with 1,643,000 ac. in 1941. Tin conservation limited soups to 50% of the 1941 pack and spinach to 80%. Tin conservation order M-81, as amended Dec. 9, 1942, permitted unlimited packs of green asparagus, snap beans, lima beans, sweet corn, green peas, tomatoes, tomato juice, pulp, paste and sauce. By War Production board order M-86e, the government reserved 40% to 100% of the 1942 pack, and canners were ordered to set aside about half as much of the 1943 pack. The Office of Price Administration announced in Dec. 1942, that preparations were being made to ration all canned vegetables to assure equal distribution of civilian supplies. (*See* also AGRICULTURE; LETTUCE; MARKET GARDENING; POTATOES; TOMATOES.) (S. O. R.)

Tuberculosis. **Diagnosis.**—The making of diagnoses from a single phase of an examination was discouraged and emphasis was placed on the necessity of complete examination before labelling any individual as tuberculous. In evaluating the different methods of making X-ray inspections of the chest the Industrial Hygiene Foundation of America, Edwards of New York city, and others, found the standard-sized celluloid film best; the standard-sized paper film a close second and fully as valuable in finding cases of tuberculosis; the 4 x 5-in. photoroentgenogram was in third place; and the least valuable method was the 35-mm. photofluorogram.

Treatment.—The treatment of tuberculous animals with promin (sodium p,p′-diaminodiphenylsulphone-N,N′-didextrose sulphonate) was found to have a marked deterrent effect on the disease. This drug was administered to a sizeable number of tuberculous persons but not enough time has elapsed to justify conclusions concerning final results.

Prevalence and Attempts to Control in Various Nations.—In Great Britain there was an increase in deaths from tuberculosis after World War II began. The age groups most affected were children, young women and older men. The increase in tuberculous meningitis was alarming. It was recommended that mass X-ray inspections of the chest be made of all persons employed in or entering the various industries as well as those entering the military service. Periodic examinations of these persons was also recommended as well as examinations of students of nursing and medicine. In many thousand examinations in the royal navy, 0.3% was found to have active pulmonary tuberculosis; in the air force, 0.2%; and in the army, 0.1%. Examinations made of men prior to entering the service revealed about 1% with pulmonary tuberculosis.

In Paris after the war began the mortality from tuberculosis increased approximately 10%; in children, 28%. In countries such as Belgium, Holland, Poland, Greece and China, the increases in tuberculosis were alarming; indeed, in some of these countries it was said to have reached epidemic proportions.

Leitner stated that in Basel, Switzerland, approximately one-third of the adolescents and young adults were nonreactors to tuberculin.

In Argentina all the applicants to and employees in positions in which there is frequent contact with the public were periodically examined. All applicants for government positions had tuberculin tests, X-ray inspection and clinical examinations as indicated. Thus, those who had clinical tuberculosis at the moment were found as well as those who subsequently developed it. In Paraguay an antituberculosis campaign was well organized, with the aim of having one and one-half beds for tuberculous patients for each death from this disease.

Approximately a 5% increase in tuberculosis mortality occurred in Canada, which was the first increase in 15 years. Among 400,000 men examined for entrance into the Canadian army between Sept. 1939 and March 1942, approximately 1% was rejected because of tuberculosis. It is significant that only 114 cases of clinical tuberculosis developed in the Canadian army up to March 1, 1942. The entire population of 3,000 of Geraldton, Ont., was examined for tuberculosis.

There was evidence that in the United States the mortality from tuberculosis was lower during 1942 than in the immediately preceding years. Tuberculosis should not increase during the war if the sanatoriums and hospitals are kept operating so as to isolate contagious cases and seek out such cases from the general public for isolation and treatment.

Large numbers of tuberculosis surveys were conducted among industrial workers in such places as Akron, O. Attention was called to the great danger of associating tuberculosis with industry, that is, blaming working hours, dust inhalation, etc., for the disease when, in reality, its true cause is often unrecognized contagious cases among the individual's other associates.

Edwards reported that the entire tuberculosis facilities of the New York city health department previously used in mass surveys were diverted in 1942 to examine rejectees from the local induction station. This represented a mass survey of approximately 700,000 individuals from whom all with evidence of lung disease were referred to the health department.

Special Organizations and Projects.—The tuberculosis committee of the American Student Health association reported that n the school year 1940–41, 255 colleges had administered the tuberculin test to 149,744 students. In 108 colleges, all food handlers, and in 92, faculty members and administrative personnel were adequately examined. From 1936 to 1941, among those colleges with no program of finding cases of tuberculosis, 984 students among a student enrolment of 668,895 were reported to have tuberculosis, whereas, among those colleges with a case-finding program 3,523 new cases of tuberculosis were discovered from a total enrolment of 1,850,755. Thus, approximately seven cases were found in the institutions with the program, to one in those without.

In Minnesota, Meeker county was continued as a demonstration area by the state medical association. All citizens, regardless of age, were being tested with tuberculin; all reactors were having X-ray film inspections of their chests and all with X-ray shadows were being examined to determine whether the shadows were cast by tuberculosis or other diseases. This project was being supported financially by local and state organizations, by the American Medical association and the National Tuberculosis association.

The gross sale of Christmas seals in the United States amounted to approximately $7,000,000 in 1941, and $8,000,000 was the goal in 1942.

Tuberculosis Among Animals.—The bovine type of tuberculosis constituted a serious problem in Great Britain. Much of the tuberculosis in man was contracted from animals; indeed 40% of the cattle were infected and 40% of those slaughtered in the abattoirs had areas of disease plainly visible to the naked eye. Since it was impossible to control tuberculosis in cattle it was strongly recommended that milk be pasteurized in towns and cities and that housewives in rural communities bring all milk to the boiling point before it was consumed.

In December the United States bureau of animal industry reported that between 1917 and 1942, 252,926,608 tuberculin tests were administered to the cattle of the U.S. The 3,836,911 reactors were slaughtered and their carcasses were carefully examined for tuberculosis. Of the 10,983,086 cattle tested in 1942, only 0.26% reacted to tuberculin. The entire nation was by 1942 a modified accredited area. At points of federal meat inspection the carcasses of 14,413 swine were sterilized and those of 13,357 were condemned because of tuberculosis. Between 1925 and 1942, 131,522 fowls were found to react to the tuberculin test.

Prevention.—Methods of immunization were in the same controversial state as they had been for a quarter of a century. Activities centred on the only well established preventive measure, namely, the isolation of persons with contagious tuberculosis.

(J. A. My.)

Tufts, James Hayden (1862–1942), U.S. educator, was born July 9 in Monson, Mass. He studied at Amherst college, and at Yale university's divinity school and received his Ph.D. degree from Freiburg, Germany. He joined the University of Chicago as assistant professor of philosophy in 1892, later becoming chairman of that department. He was vice-president, 1924–26, and acting president in 1925. Among Dr. Tufts' most important contributions to contemporary philosophy were his historical analysis of the anthropological and social history of ethics and his application of the principles of ethics to contemporary problems. Dr. Tufts, who was an associate of Jane Addams during her early days at the Hull House, also helped organize the Institute of Juvenile Research at the University of Chicago. In collaboration with John Dewey, he wrote *Ethics* (1908). Following his retirement in 1930, he taught a seminar course in philosophy at the University of California. He died in Berkeley, Calif., Aug. 6.

Tung Oil: *see* VEGETABLE OILS AND ANIMAL FATS.

Tungsten. Although data were far from complete, such as were available indicated that the world production of tungsten concentrates (60% WO_3 basis) increased from 44,600 metric tons in 1940 to 47,000 tons in 1941. Of this amount, 6,500 tons was produced in the United States, and the equivalent of 8,500 tons was imported in the first nine months of 1941; there was then in the country a known supply of 15,000 metric tons, to which there was still to be added such imports as were received in the fourth quarter of the year, and the reserve stocks on hand, neither of which amounts was known. This known supply is of about the same magnitude as the estimated consumption during the year, so that the fourth quarter imports were available as additions to the reserve stocks. If we assume that the last quarter imports were maintained at the average level of the previous quarters, the total made available in the United States during the year would have been 17,800 tons, or 38% of the world production.

Turning to the other side, we find that of the 1941 production capacity, 26% was in 1942 under Japanese control, and the 20% produced in China was pretty well isolated from access to the United Nations, though not available to Japan. However, in view of the rapidly increasing output of the United States itself, as well as of Bolivia and Argentina, the prospects for maintaining an adequate supply in the United States was not at all unfavourable. In fact, some felt that the United States was in a fair way of becoming not only self-sufficient, but of becoming an exporting nation, though results attained up to the close of 1942 hardly seemed to justify so optimistic a view of the situation.

The United States output of 1941 was not only a record for recent years, but for all time, exceeding by a considerable margin the peak production of World War I, and the same was also true of Bolivia and Argentina; furthermore, material increases in output were expected from all three.

British requirements were apparently being largely supplied from Portugal and Spain, where production increased by twenty fold in a decade, and was in 1942 almost as great as in the United States. (*See* also MINERAL AND METAL PRICES AND PRODUCTION.) (G. A. RO.)

Tunisia: *see* FRENCH COLONIAL EMPIRE.

Tunnels. Work on the Brooklyn-Battery tunnels and the Continental Divide tunnel was ordered halted by the War Production board.

The great Chicago underground railroad system of tunnels, estimated to cost $64,000,000, was more than 90% complete.

The aqueduct of deep level tunnels of New York city's Delaware water supply system was rapidly approaching completion. In the face of rigid specifications, the work of lining these tunnels was carried out most effectively and at great speed in handling concrete by concrete pumps and concrete pneumatic ejectors. The methods followed by the contractors in placing of the concrete varied in accordance with each contractor's particular ideas of procedure. In all cases, however, extraordinary progress was made in tunnels varying from 13½ ft. to 19 ft. internal diameter, and in general exceeded 30 ft. per day of completed tunnel.

The construction and completion by the United States army engineers of a railroad tunnel 13,000 ft. long as a cut-off on the Seward-Fairbanks railroad, gave more southerly access by William sound to the Gulf of Alaska than by the terminus at Seward.

News in Nov. 1942 came from Japan that the major construction of a single track railroad tunnel under Shimonoseki straits, separating the main island of Honshu from the island of Kyushu, had been completed and opened to traffic after six years of construction. This tunnel superseded a train ferry in the rapid tidal flow of the straits and reduced the time between Tokyo and Kagoshima, in the island of Kyushu, from about 40 to 32 hr. Since the island of Kyushu is the main local source of Japan's coal supply and industry allied thereto, this became an accomplishment of some importance in the serious matter of World War II logistics.

In London, engineers continued to prepare for the possibility of large-scale air raids and were strategically constructing tunnels at the deep level of the tube railways for new shelters from air raids. (J. FE.)

Turkestan, Chinese: *see* SIN KIANG.

Turkey. A republic in southeastern Europe and western Asia. Area 296,500 sq.mi.; pop. (Oct. 20, 1940) 17,869,901. Capital, Ankara. Chief cities: Istanbul (789,346); Izmir (184,362); Ankara (155,544); Seyhan (89,990); Bursa (77,348); Eskişehir (60,614); Gazi Antep (57,314). Religion: Mohammedan. President (1942), General Ismet Inonu; premier, Shukru Saracoglu.

History.—During 1942 Turkey maintained its non-belligerent attitude, but with a shifting emphasis which reflected the change in the development of the war. While in 1941, with Germany's victories in the Balkans and in western U.S.S.R., there had been a certain cooling off in Turkey's relations with her British ally and a certain rapprochement with Germany, the growing strength of the United Nations in 1942, inclined Turkey again to the side of the democracies. While following a prudent policy of neutrality and of building up her army to greater strength, Turkey became ready by the end of 1942 to resist a German thrust through her territory into the middle east and thus fulfilled her important function of protecting the British position in Iraq and Syria. The appointment of Laurence A. Steinhardt, former United States ambassador to the soviet union, as ambassador to Ankara in Jan. 1942, showed the great importance which the United States placed on Turkey's position. Ambassador Steinhardt was instrumental in bringing about a rapprochement between Turkey and the soviet union.

On July 7 Premier Dr. Refik Saydam died suddenly of a heart attack. His successor became the foreign minister Shukru Saracoglu (*q.v.*). When Dr. Ahmet Fikri Tuzer, the minister of the interior, died, he was replaced by Receb Peker.

At the beginning of 1942 the relations between Turkey and the soviet union were rather strained. It was then believed that in case of an Allied victory the soviet union might claim the Bosporus. The British ambassador, Sir Hughe Knatchbull-Hugessen, who had been to the soviet union and the middle east, tried to dispel these apprehensions by his reports of Anglo-Soviet plans, which denied any intention on Turkish or Iranian territory. Yet a short while later, in March, it was alleged that an attempt at bombing the German ambassador to Turkey, Franz von Papen, had originated in the soviet consulate in Istanbul. Ambassador von Papen was not injured, but soviet offices were searched, and suspicion against communist influences were openly voiced. It was only by the end of the year that the tension in the relations with the soviet union subsided. The visit of Wendell Willkie to Turkey and the U.S.S.R. and Ambassador Steinhardt's mediation were credited with this improvement. At the same time the minor

TURKISH GIRLS in a mass calisthenics drill at Ankara stadium on Youth day, April 23, 1942

Soviet officials who had been thought involved in the attempt at the assassination of Ambassador von Papen were found innocent.

In the spring Germany failed to deliver the important heavy goods which she was pledged to deliver under the German-Turkish trade agreement, while Great Britain continued to supply Turkey on schedule with locomotives, freight cars, war equipment, and even small warships, and in addition had helped to offset a bad Turkish harvest by supplying wheat. An important concession gained by Germany was Turkey's promise of sending 45,000 tons, or half of her annual output, of chrome to the Krupp armament factories in exchange for German arms. In spite of this deal Turkey came closer and closer to the Allied side, which was of great importance in view of her most strategic position. Numan Menemencioglu, who in the fall became Turkish foreign minister, was regarded as definitely pro-democratic as the prime minister. On Nov. 1 a special session of parliament was opened by a declaration of the president of Turkey in which he warned that "Turkey is closer to war today than at any time since the present world conflict started." He pointed out that "with the war spread over every quarter of the globe, one begins to understand that political institutions founded on domination by a single power cannot be maintained."

The war necessarily produced a growing scarcity of goods and a rise of prices. With the beginning of 1942, the government introduced for the first time strict measures of rationing. A newly revised law of national protection was to help in the fight against wartime profiteering and waste, especially against the hoarding of staple foods. Shortages were especially felt in bread, sugar, cigarettes and matches. The bread ration was fixed at 375 grams per day and person.

Education.—Education is compulsory, yet among the older people there are many who are still unable to read and to write, especially in the Latin characters, introduced in 1928. The number of schools in 1939 was 8,169, with 23,663 teachers (7,458 women), and 904,453 students, of whom 301,987 were girls. The total expenditure on education by the government was in 1939 £T. 29,785,240. There are 2 universities, one in Istanbul, reorganized on modern lines in 1933, and one in Ankara.

Defense.—There is compulsory military service for all men from 20 to 46. Starting in 1942 every man had to serve for three years. The army in 1942 consisted of 11 army corps of a possible strength of 2,000,000 men in wartime. During 1941 and 1942, strenuous efforts were made to modernize the army, the small navy and the air force.

Finance.—Revenue for 1941–42 was estimated 309,743,000, expenditure at 309,740,396 Turkish pounds. The public debt amounted on May 31, 1939 to £T. 619,385,681. The monetary unit is the Turkish pound, valued at approximately 76c U.S. early in 1942.

Trade and Communication.—Imports in 1940 amounted to £T. 68,900,000 and exports to £T. 11,400,000. The imports in 1940 came from Italy, with Great Britain as the close second, followed closely by Germany and the United States, while the Turkish exports went to Italy, United States, Great Britain and Germany. The principal articles of import in 1940 were mineral oils and coal, machinery, iron and steel manufactures, cotton piece goods, paper and paper manufactures, chemicals, tea, coffee and cocoa, and rubber manufactures. The principal exports were tobacco, cotton, hazelnuts, mohair, olive oil, raisins, wool, opium, chrome, barley and figs.

Turkey had on July 1, 1940 a merchant marine of 290 ships of 217,381 gross tons. The length of the railway lines on Dec. 31, 1940 was 4,609 mi., of which 4,339 mi. were owned by the state.

Agriculture.—Agriculture, the main industry of the country, was now being modernized with the help of the government. Cereals, tobacco, opium, figs, nuts and almonds were being grown. Silk, mohair, skins and hides and olive oil are important products. The breeding of sheep, goats and cattle is of great importance. In 1940 the wool clip was 33,000,000 and the mohair clip 7,700,000 kilos. (H. Ko.)

Turnbull, Margaret (? –1942), U.S. author, was born in Glasgow, Scotland, and was taken to the United States while a child. She attended public schools in

Arlington, N.J. Her first novel, *W.A.G.'s Tale,* was published in 1913. Among her other works are *Looking After Sandy* (1914), *Handle With Care* (1916), *A Monkey in Silk* (1931), *The Return of Jenny Weaver* (1932) and *The Coast Road Murder* (1934). Miss Turnbull also wrote a number of plays, the most successful of which, *Classmates,* was written in collaboration with William C. DeMille and appeared on Broadway in 1907. She died at Yarmouth Port, Mass., on June 12.

Turner, Sir Ben (1863–1942), British labour leader, became a cotton mill boy at the age of 10. From weaver's apprentice, he rose to rank of president of the National Union of Textile Workers. He was knighted in 1931. Sir Ben served in parliament as Labourite from Batley and Morley from 1922 to 1924 and from 1929 to 1931, and was mayor of Batley, 1913–16 and 1934–35. In 1928 he co-authored the Mond-Turner agreement by which trade unions and employers agreed to collaborate in avoiding strikes and assisting British industry. He was secretary of mines, 1929–30. He died at his home in Yorkshire, Sept. 30.

Unemployment. Unemployment fell to the lowest levels after 1929, in 1941–42. This was the characteristic picture in the various nations, although various localities and industries in many of the nations did not exhibit the expansion of employment typical of the general situation. The steady spread of war and the increased significance of industrial production of almost all kinds in the "total war" beginning in 1939 resulted in an increasing tempo of economic activity throughout 1940–42.

The writer has less confidence than formerly in the employment statistics of many nations. War diverts attention and funds from such activities as gathering statistics. Probably the general picture derived from the data reported by the nations to the International Labour Office is correct but one would not be justified in basing precise calculations and comparisons upon the available data. The published figures are of two principal kinds, each gathered in several different ways: statistics of employment; *i.e.,* of the number of people at work, and statistics of the number of people in need of work. Employment statistics are derived from "establishment" reports collected by mail or through field agents or labour inspectors. Unemployment statistics are furnished by the employment exchanges (applications for work), unemployment insurance systems (applications for benefits), unemployment relief records, reports of trade union secretaries and censuses of unemployment.

The various types of statistics agree reasonably well in their picture of what happened in the different countries, but not always upon the extent of the changes which occurred.

Great Britain and Northern Ireland have three-fourths or more of their wage earners (about 15,000,000) under unemployment insurance. These constitute about 90% of the British labour supply. In 1939 the employment exchange statistics showed an average of 1,297,801 wholly out of work. In 1940 the average number was 802,921; in 1941, 292,402; and in 1942 (8 months), 126,073. If the 4,750,000 not covered by the insurance act were included in the figures, the unemployment percentage would be more apt to fall than to increase, since military service, the police, civil service, teaching and other relatively stable occupations were in this group.

Registrations of unemployed persons at the employment offices of Eire increased fivefold from the pre-depression years to 1935. There was an average of 119,148 unemployed persons registered in 1935. The registration averaged 74,656 in 1941 and 81,648 per month through Aug. 1942. That was high unemployment for Ireland in 1941–42 and reflects the adverse effect of the war upon that country.

Unemployment remained at high levels in France from 1935 to Oct. 1940. In Oct. 1940 there were nearly twice as many unemployed receiving relief (750,000) as the average for the preceding ten years. The average number of applicants for work at the employment offices was 404,604 in 1939. The figure was 1,059,000 in Oct. 1940. No reliable figures were published after Oct. 1940.

High unemployment figures obtained in the Netherlands from 1933 continued until March 1939. The winter of 1938–39 was very bad. From April improvement was rapid. There was an average of 253,261 registered at the employment exchanges in 1939 and 205,003 in 1940, then the registrations fell to a low of 126,920 in 1941. Reliable figures for 1942 could not be obtained. The percentage of insured workers drawing unemployment insurance benefits averaged 21.8% in 1939. In 1940 it approximated 21.7% and in 1941, was 22.8%. Belgium experienced marked improvement in 1937, but with worse conditions in 1938. The average number unemployed increased from 125,929 in 1937 to 203,000 in 1938; then dropped to 173,000 in 1939 and 151,000 in 1940. Unemployment was much worse from Oct. 1940 through Feb. 1941 (more than 200,000); the subsequent figures were not reliable. In 1937 the insured workers of Belgium lost 13.1% of their possible working time; in 1938, 17.6%; in 1939, 18.8%. Figures for 1941–42 are not available.

Denmark, Norway and Sweden all experienced moderate improvement during the first eight months of 1939 following slightly worse unemployment in 1938 than in 1937. Denmark's percentage of trade unionists unemployed was 21.4% for 1938 and 18.4% for 1939. It was 23.9% in 1940; 7.6% in 1941; and 10.6% during the first 8 months of 1942. Obviously, providing Germany with war supplies was benefiting Denmark. Norway's in 1938 was 22%; in 1939, 18.3% and in 1940, 23.1%. There were no figures available subsequent to 1940. Sweden's percentage of unemployed union workers in 1938 was 10.9%; in 1939, 9.2%; in 1940, 11.8% and in 1941, 11.3%. During the first 6 months of 1942 the figures changed little from those of 1941.

The German figures are of questionable value, partly because of changes in the bases of computation, partly because of the war situation and its effects upon the statistics. The average number of applicants at employment exchanges dropped from 912,312 in 1937 to an average of 429,461 in 1939. No figures have been available since 1939. Unemployment probably stood at the lowest figures in German history. Unemployment is not permitted.

Switzerland's employment exchange figures are unusually reliable measures of unemployment because both the relief act of 1919 and the unemployment insurance law require applicants to register at the employment exchanges. From 1927 to 1929, 2.2% of the employable population were wholly unemployed and 1.6% partially. For practical purposes, this is zero unemployment in any country. In 1929 an average of 8,131 applicants registered at the employment offices (out of about 2,000,000 employables). In 1939 the average was 40,324. In 1940 it was 16,374 and in 1941, 10,550. In the first 8 months of 1942 the average was 11,515. These figures represent absolute minimums for unemployment—from 1.4% to 1.6% of the insured employable population.

The Italian index of employment (1929 = 100) was down to 78.5 in 1932 and back to 94.9 in 1936, 104.5 in 1937, 110.7 in 1938 and 113.3 in 1939. Statistics for Italy since 1939 are not available.

Czechoslovakia had very low unemployment in 1939. Their employment office average registrations dropped from 335,518 in 1938 to 44,080 in 1939. No figures were available after that date.

Finland publishes only employment exchange statistics. Their registrations reached a peak of 17,351 in 1933. For 1939 they averaged 3,300; 1940, 3,955; in 1941, 3,384; and in 1942 averaged below 2,000 per month through August.

Yugoslavian employment exchange statistics record an average of 22,517 registrants for work in 1938; 24,223 in 1939 and 26,724 in 1940. In 1941 the figure was 26,724.

The only Mexican figures on unemployment are "official estimates." The figure given for 1930 was 75,695; 1932, 339,378; 1938, 209,332; 1939, 198,593; 1940, 184,274. No figures were available after 1940.

The general trend of employment in the United States and Canada was downward in the first half of 1938, with severe unemployment, particularly in the United States, until the spring of 1939. There was then steady improvement the balance of the year.

The Canadian employment index (1929=100) averaged 94.8 for 1938; 95.7 for 1939 and 112.1 for 1940. In 1941 it was 147.0 and during the first 7 months of 1942, 172.8. The employment exchanges carried average registrations of 103,739 during 1939 and 100,417 in 1940.

The United States took a special census of unemployment, Nov. 20, 1937, which recorded 7,822,912 as unemployed (2,001,877 of whom were employed on government relief work). This census was a voluntary report of individual citizens on forms left at all homes by the postal service. Sample tests made on 1,455 mail routes indicated that a 100% return might have shown as many as 10,800,000 idle on Nov. 20. A half million workers were laid off in Nov.–Dec. 1937. Comparing these figures with the 13,500,000 to 14,500,000 idle in 1932–33, the 1937 unemployment figure was discouragingly large. But in 1939–42 the trend of unemployment was continuously downward and by Sept. 1942 approximated 1,700,000.

Previous to 1930 the United States economic system expanded each decade rapidly enough to absorb the growth of population. During the '30s economic growth failed to keep pace with the growth of labour supply. The unemployment of 1937 was in considerable measure due to this factor. The expansion of 1939–41 practically absorbed the growth in labour supply of the 1930s. If large numbers became unemployed in some subsequent year it would be because of other factors than retarded economic development.

The factory employment index of the U.S. stood in the census month (Nov. 1937) at 101.1 (1923–25 base). A year later it was 90.5 and from Jan. to Aug. 1939 ranged between 92.3 and 96.3. The low point for the '30s was in 1932, 66.3. The index rose rapidly after July 1940, and in Jan. 1942 stood at 132.5 (*see* Table) from which figure it rose steadily and rapidly to 154.8 in Oct. The rise in employment continued throughout the balance of the year but the later figures were not available.

Pay rolls always fluctuate more violently than employment be-

MANY THOUSANDS OF UNEMPLOYED NEW YORKERS answered the call of Henry J. Kaiser for workers in his Oregon shipbuilding yards in Sept. 1939. Through the U.S. Employment Service in New York city, Kaiser's agents quickly hired two trainloads of workers

cause of overtime and part-time work. The monthly average of pay rolls (1923–25=100) was 110.4 in 1929; but 46.7 in 1932; 85.6 in 1936; 102.0 in 1937; 77.5 in 1938; 90.8 in 1939 and 105.4 in 1940. Starting at 173.5 in Jan. 1942, the index rose to 261.0 by Oct. The more rapid rise of the pay roll than of the employment index in 1941–42 was due in part to increases in wage rates and in part to the large amount of overtime paid for at time and a half and double time.

While employment exchange statistics are available for the U.S., the figures have been so profoundly influenced by relief, public works and other governmental policies that they cannot be used in comparisons with other nations. It should be noted that the 2,400,417 persons registered with the U.S. Employment service in Sept. 1942 included a considerable number of people who had jobs. It is not an unemployment figure.

Japan was one of the nations with high employment in 1937, a by-product, of course, of war. The employment index (1929=100) was 123.8 in 1937 and 131.2 in 1938. In 1939 it rose to 135.9. The government's official estimates of unemployment in 1932 estimated that but 6.8% of their employable population was idle, a figure hard to reconcile with an employment index of 82 that year. For 1938 their unemployment estimate was 237,371. The estimates were about 60,000 lower during 1939 than for the corresponding months of 1937. Japanese unemployment was low, 1937–39. No figures were available after 1939.

The only unemployment figures for Australia are compiled from reports sent in by union secretaries—a not very satisfactory type of unemployment statistics. The Australian trade union returns showed 45,775 or 9.7% of the union workers unemployed (monthly average) in 1939; 39,116, or 8% in 1940; 27,289, 5.3% in Feb. 1941 and 3.6% in May 1941. The figure for Feb. 1942 was 10,767 and for May, 10,353. But unemployment in Australia was at a low figure throughout 1942, as the country was geared to wartime production efforts.

The employment exchange registrations in Chile jumped from an average of 29,345 in 1931 to 107,295 in 1932, and then gradually dropped to 30,055 in 1934. Since then, applications for work have been at low levels. Registrations averaged only 10,672 per month in 1935; 6,474 in 1936; 3,215 in 1937; 4,578 in 1938; 9,415 in 1939; 8,550 in 1940, to 4,117 in 1941. They averaged below 3,000 per month in 1942. (*See* also CENSUS, 1940; SOCIAL SECURITY; UNITED STATES; WAGES AND HOURS.) (D. D. L.)

Unemployment Insurance: *see* SOCIAL SECURITY.

Unfederated Malay States.

One of the three principal subdivisions of British Malaya (*See* also STRAITS SETTLEMENTS and FEDERATED MALAY STATES). Area, 24,728 sq.mi.; pop. (excluding Brunei) in 1940, 1,912,497. These principalities, all under Japanese military occupation in 1942, are ruled in normal times by native sultans who accept advice as to policy and administration from British residents. The largest, richest and most populous of these states is Johore, at the extreme southern end of the Malay peninsula. Its revenue in 1940 was 24,737,590 Straits dollars, its expenditure 23,548,568 dollars. Its exports were 138,214,062 Straits dollars, its re-exports 1,933,979 dollars, its imports 57,275,959 dollars. The area, population and capitals of the land states in 1940 were as follows: Johore, 7,330 sq.mi., pop. 737,590, capital Johore City; Kedah, 3,660 sq.mi., pop. 515,758, capital Alor Star; Kelantan, 5,750 sq.mi., pop. 390,332, capital Kota Bharu; Trengganu, 5,050 sq.mi., pop. 211,041, capital Kuala Trengganu; Perlis, 310 sq.mi., pop. 57,776, capital, Kangan. The inhabitants of these states are mostly Malays, except in Johore, where the Chinese outnumber the Malays. After rubber the most important products are rice and coco-nuts. Union of South Africa: *see* SOUTH AFRICA, THE UNION OF.

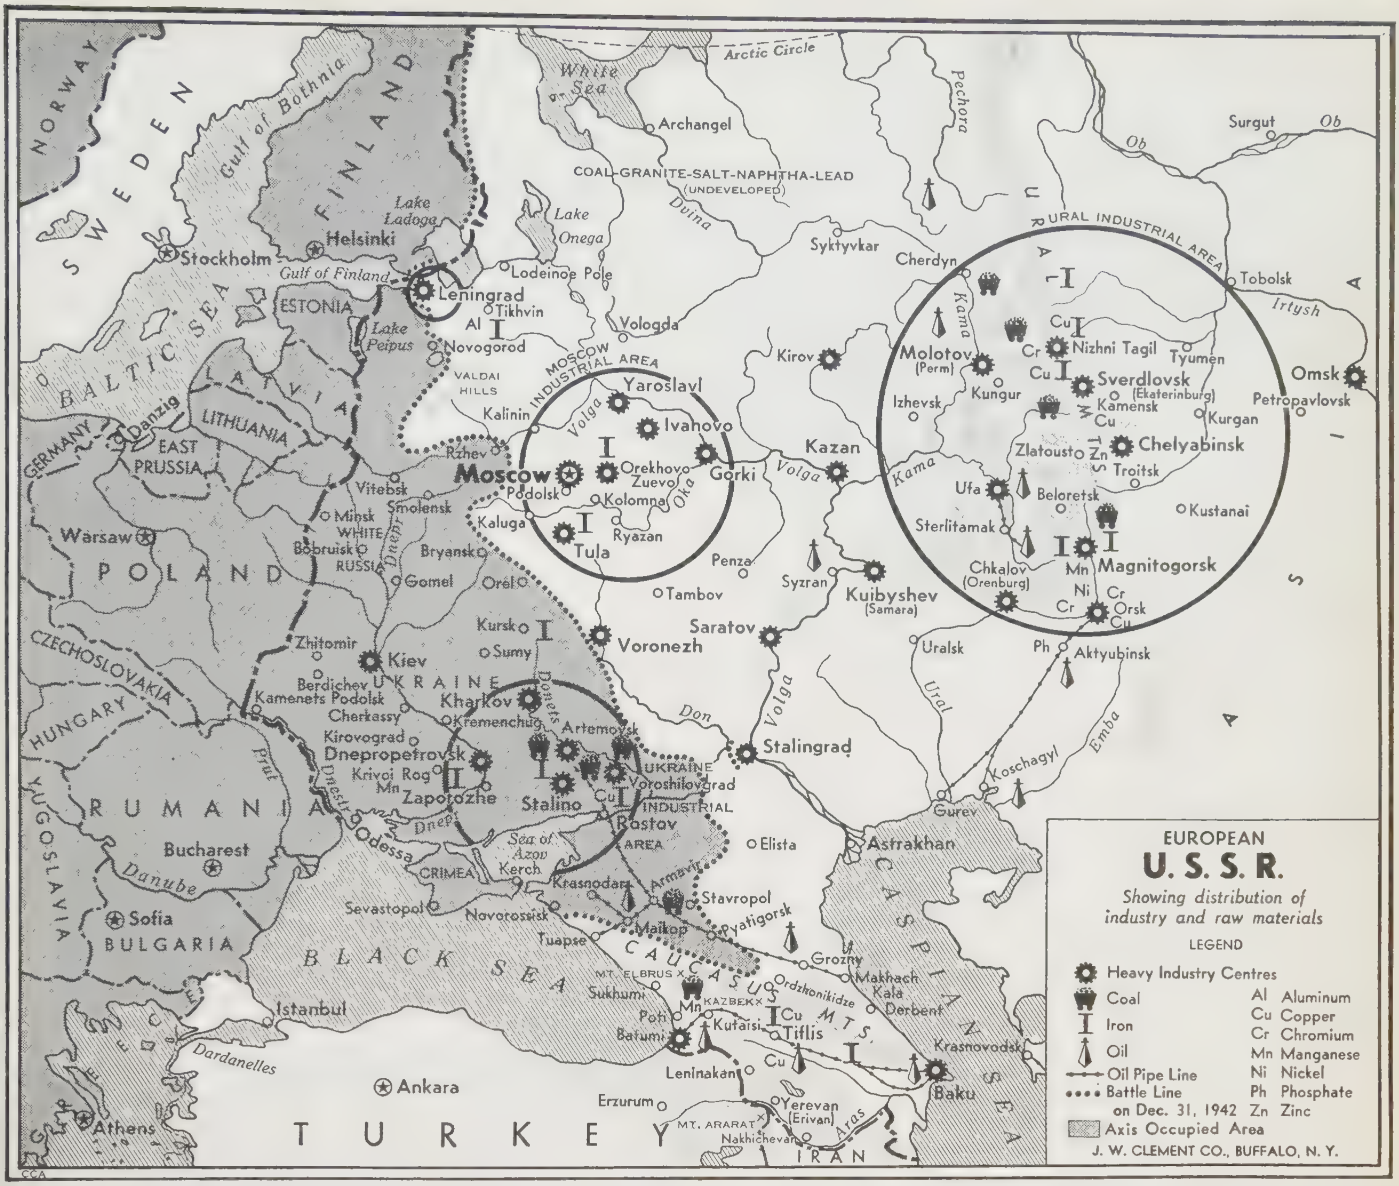
Union of Soviet Socialist Republics.

A state of eastern Europe and northern and central Asia. Area (Aug. 1939) 8,175,500 sq.mi., over one-fifth of which lies within the polar circle; pop. (Jan. 17, 1939 census), 170,467,186. The general increase in the population of the U.S.S.R. for the period of 12 years to Jan. 1939 amounted to 23,439,271, or 15.9%, the rate of increase varying throughout the period. Sixty-four per cent of the population of the soviet union lived in the Russian Soviet Federated Socialist Republic (78% of the U.S.S.R. territory), the remaining 36% of the population being distributed almost in equal halves between the Ukrainian S.S.R. (2% of the territory) and the nine other union republics (total territory 20%). In Jan. 1939, Great Russians constituted 58.4% of the population (as against 53% at the end of 1926); Ukrainians 16.6% (21.2%); White Russians, 3.1% (3.2%); Uzbeks, 2.9% (2.7%); Kazaks, 1.8% (2.7%); Tatars, 2.5% (2%); Jews, 1.8% (1.8%); Azerbaijanis, 1.3% (1.2%); Georgians, 1.3% (1.2%); Armenians, 1.3% (1.1%). Altogether some 60 different ethnic groups are comprised in the union. The 140-odd languages and dialects spoken in the U.S.S.R. belong to the following groups: Indo-European, Caucasian, Semitic, Ural-Altaic (Finno-Ugrian, Samoyede, Turkic, Mongolic, Tungusic), Palaeo-Asiatic and Far Eastern. Capital: Moscow (4,137,018). Ten other cities had a population of more than 500,000 in 1939: Leningrad (3,191,304), Kiev (846,293), Kharkov (833,432), Baku (809,347), Gorki (644,116), Odessa (604,223), Tashkent (585,005), Tiflis (519,175), Rostov-on-Don (510,253), Dnepropetrovsk (500,253). Premier: Joseph Stalin (*q.v.*).

History.—The winter of 1941–2 in the U.S.S.R. was chiefly occupied, at the front by the counter offensive of the Red army, which it was clear (from the admission of German official statements themselves as well as from the statement of Lord Beaverbrook) came within an ace of involving the German army in a serious disaster; and behind the front in a rapid development of industry in the new centres beyond the Volga. It was a winter of grave sacrifices for the civilian population, especially in cities in or near the front line like Moscow and Leningrad and Sevastopol: sacrifices borne with heroic fortitude. It was a winter of enormous efforts on the production front by workers in the key industries, both those near and those distant from the battle zone. The blow which the German advance aimed at some of the most important industrial centres of the country was to a large extent parried by the evacuation of key factories from the threatened areas to new sites in the new industrial districts round Kuibyshev on the Volga, in the Urals, or farther east still in Siberia. This was an evacuation of both the personnel (with their families) and the equipment of whole factories by a railway journey of sometimes a thousand miles or more. The huge proportions of this movement and the strain it must have placed on the transport system can be gathered from the fact that in some cases it took a thousand railway wagons to transport a single factory, and that probably about 1,000,000 persons were evacuated from the two cities of Kharkov and Kiev alone. In its planning and organization as well as in its dimensions this evacuation was extraordinarily impressive, as was also the speed and efficiency with which new sites were prepared for the "leap-frog" factories, as these were called (often temporary structures of timber, to economize in steel). The buildings to house them in some cases were already completed by the time the evacuated plant and personnel had arrived. Naturally, there were delays in many cases in getting pro-



duction started in its new home, owing to difficulties of construction and procuring raw material supplies and accessories in the new areas. But already by April 1942 most of the evacuated plants were operating at something approaching normal capacity, and many of them were even exceeding their former output on the old sites.

Economic Situation.—The economic losses suffered from the German advance, especially from the occupation of the Ukraine, were very serious, and not to be underestimated. The loss was specially severe in the raw materials of heavy industry and in basic products. With the loss of the Ukraine went between a half and two-thirds of the soviet union's prewar output of coal and iron ore and pig iron, and nearly half of her prewar steel output. The Dnieper region was an important centre of aluminum production, of ferro-alloys and of rolled steel. Kharkov specialized in aircraft and heavy engineering. Voroshilovgrad contained one of the largest locomotive-building works in the country. Melitopol on the sea of Azov had several Diesel-engine works. As regards agriculture, the most serious loss was in sugar-beet, some nine-tenths of which was in the occupied regions. With the German advance to the Don and into the North Caucasus in their summer offensive of 1942, more than half of the former wheat production and about 40% of rye production was lost to the U.S.S.R. More than half the pigs and more than a third of all cattle were formerly in territory that was overrun by the invaders. Much of this cattle, at any rate that belonging to collective farms, was driven eastward for hundreds of miles in face of the German advance; but what proportion reached safety was unknown.

As regards engineering, the position was considerably better: probably not more than a fifth of the prewar soviet capacity lay in areas occupied by the Germans. Moreover, engineering plants, even heavy engineering, are generally easier to evacuate than blast furnaces; so that a larger proportion of equipment was probably capable in this case of being salvaged and removed. The same is true of the non-ferrous metal industry and of the most modern armament plants, most of which were located in the newer industrial centres east of the Volga. More than two-thirds of soviet lead, zinc and nickel, and nearly all the chrome, copper and cotton come from the eastern part; and even in the case of aluminum a new plant in the Urals was under development at the outbreak of war, based on newly exploited bauxite deposits on the eastern slopes of the Urals. By the end of 1942 this plant might have been capable of producing as much as the combined previous outputs of the two main aluminum plants on the Dnieper and on the Volkhov near Leningrad. Large tungsten and tin deposits had recently been discovered and opened up in eastern Siberia, and synthetic rubber plants were in the unoccupied zone. Even in the case of oil, although in 1940 the Caucasus region accounted for

WOMEN OF STALINGRAD evacuating the besieged city during the fall of 1942

about 30,000,000 out of 34,000,000 metric tons, there was a rapidly developing and rich new area between the Urals and the Volga called "the second Baku" which was scheduled to produce 7,000,000 tons by 1942 and might have exceeded this figure. In addition it was planned to mine more than 14,000,000 tons of shale in 1942. Both in the case of oil and metals there were presumably appreciable stocks in the Volga and Ural regions, sufficient at least to meet a short-term deficiency. There were no doubt possibilities of some increased utilization of scrap; and considerable efforts were made to develop local supplies of coal and other fuels in the new industrial regions. The Urals are especially rich in minerals, which had been rapidly developed. Kusbas, 1,000 mi. farther east, had iron-ore, manganese and coal.

The main reception areas for evacuated plants were in the Volga industrial area based on Kuibyshev, the Urals, Kusbas and eastern Siberia. Light industries seem mostly to have gone to the Volga region and also factories making grenades and shells: for example, this was apparently the destination of most Moscow factories, some of which were evacuated completely, while others evacuated part of their machinery and staff to form the nucleus of new "daughter" factories. The Urals became a centre of tank, artillery and aircraft manufacture; and Kusnetsk of machine tools and the production of high-grade steels. This latter centre at the end of 1942 was in a position to meet three-quarters or more of its ore requirements from adjacent mines; while the Urals were able to overcome their previous coal deficiency by drawing supplies from the rich anthracite region of Karaganda along the newly built railway from Karaganda to Magnitogorsk. There was a good deal of rationalization carried out both in the old and the evacuated armament plants in these centres. A new wave of the "Stakhanovite" movement known as the "thousand per-centers"—of workers who themselves took the initiative in multiplying their normal output standards many times by improved methods of working—did a great deal to augment the capacity of plants. Strenuous efforts were made to train new labour supplies, especially women, by training courses in the factory and by a system of "patronage" by "Stakhanovites" and skilled workers over newcomers. Already by May 1942 M. Ustinov, the commissar for armaments, made the remarkable statement that "artillery plants of our country last month turned out as many guns as in six months of last year"; and on July 19 *Pravda*, the organ of the Communist party, stated that "at the beginning of the second year of war our industries are able to produce a larger quantity of arms and ammunition than before the war, despite the difficulties brought about by the war."

To repair the deficiencies in the food supply, campaigns were launched to increase grain production in Siberia and in the fertile north Kazakstan steppe-region; to plant sugar-beet in Central Asia and in the Saratov province, and to increase the herds on the Kirghisian pastures, in Turkmenistan and in the Altai region. Fortunately most of the equipment of the sugar refining factories was evacuated from the Ukraine in time. Measures were planned to increase the head of cattle on collective farms by more than 25% between Jan. 1942 and Jan. 1943. The slaughter or sale of cattle under one year old was forbidden and the slaughter of grown cattle required the permission of the local agricultural department. On Sept. 8, 1942, an agreement in London was signed between Soviet Ambassador Maisky and the Canadian high commissioner for a Russian purchase of 9,000,000 bu. of Canadian wheat under a credit agreement. A return was made to a system of self-supply by individual factories which was characteristic of the earlier rationing period during the first five-year plan. Each factory was instructed to institute a special supplies department, under the joint control of the factory committee and the area trade union committee, to operate farms and allotments for the supply of employees and their families, so as to make each factory as self-sufficient as possible. Many factory supply departments had not only pig and poultry farms and vegetable gardens, but orchards, vineyards and processing plants as well. In the same way schools and communal feeding trusts run by town soviets were encouraged to organize their own food production.

In order to secure an effective distribution of labour, a decree of Feb. 14, 1942 declared all able-bodied men between 16 and 65,

PROPAGANDA PAMPHLETS such as this one, showing death notices from German papers and photographs found on dead German soldiers, were dropped by Russian pilots behind the German lines in 1942

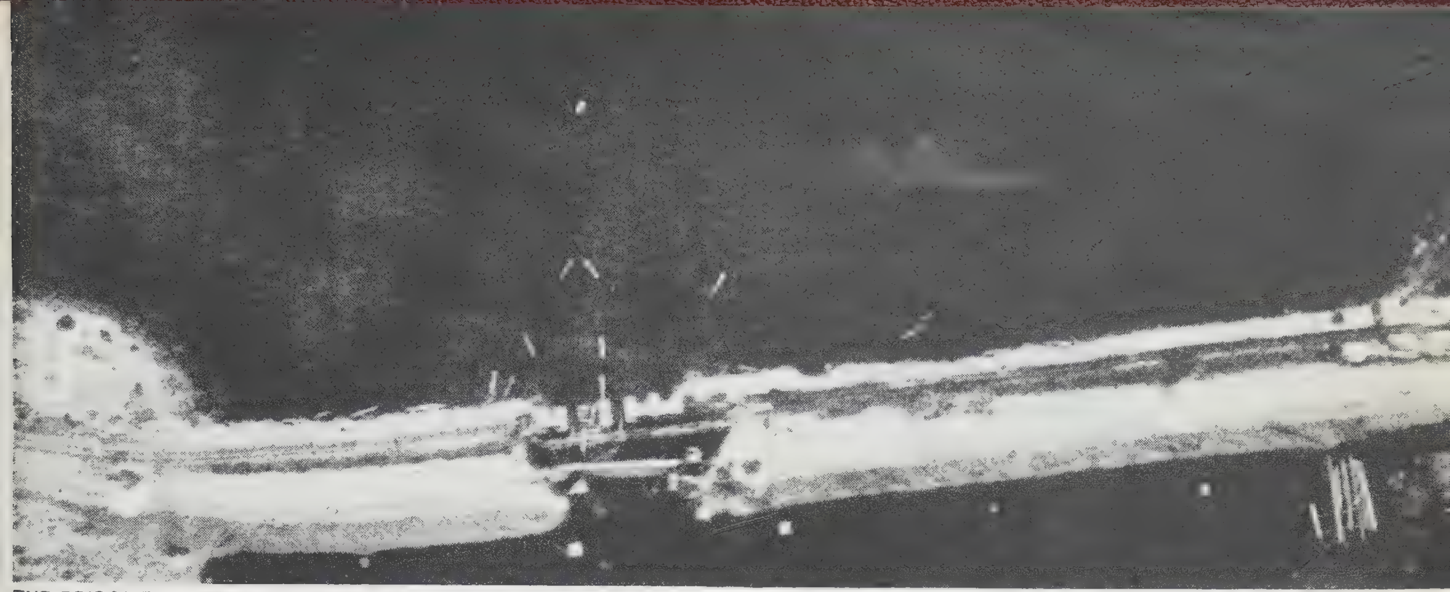
Willst Du wirklich, daß eines Tages auch DEIN Name mit Trauerrand in der Zeitung steht?



THE BRIDGE TO MURMANSK at Taibola, 40 mi. south, was severely damaged by German bombers in 1942. Russia worked feverishly during the year to keep the Murmansk supply route open. Repair crews were stationed every 15 mi. along the Murmansk railway

who were not already mobilized or engaged on government work, to be liable to be called up for war work. Women between the ages of 16 and 50, with the exception of mothers of children under 8, were made liable for calling-up for work in industry or building. The basic labour days which a collective farm member was required to put in to the work of the collective farm was at the same time raised from 100 to 150 per year.

Living Conditions.—About a third of the population of the U.S.S.R. lived in the occupied regions at the end of 1942. Of the town population a large proportion, probably more than half, was evacuated eastwards; but the proportion of the rural population evacuated must have been much smaller. Somewhere between 30,000,000 and 50,000,000 persons must, therefore, have been living in the occupied zones, many of them serving as guerrillas, harassing the German lines of communication. The plight of this population was even more grim than that of other German-occupied countries of eastern Europe. Not only were they subject to pillage and starvation on a scale quite unprecedented in modern warfare, but they were victims of a concerted campaign of terrorism and extermination to which it is hard to find a parallel since the middle ages. Virtual serfdom to German overlords was introduced into the villages on the ruins of collective farming; thousands of men, women and girls were compulsorily transported to Germany as slave labour. On Sept. 13, 1941, the German high command itself had announced that Russian prisoners would receive food inferior to that given to prisoners of war of other nationalities; and in November Foreign Commissar Molotov, on behalf of the soviet government, issued his first note to the powers, protesting against the barbaric treatment of Russian prisoners by the Germans. The note stated that the soviet government was in possession of numerous facts concerning "the systematic brutalities and atrocities inflicted by the Germans on the Red army men and officers"; that these atrocities "have taken on a particularly glaring character . . . which exposes the German military authorities and the German government as a gang of cutthroats who ignore all international rights and laws of human morality"; and spoke of "disgusting insults and torture and bestial atrocities," including torture and mutilation of war prisoners, doctors and nurses, women and even children. On April 27, 1942, this was followed by an announcement by the Moscow radio of a new note by Molotov to the powers, charging the German government with a premeditated policy of atrocity, which included the wholesale plunder of occupied territories, complete destruction of whole villages with their populations, the introduction of slave labour and serfdom for workers and peasants, the forcible transfer of civilians to Germany and their treatment as prisoners of war; extermination of prisoners by torture and starvation, and mass execution of soviet citizens regardless of position, age or sex. The note declared that the soviet government had documentary proof that these were not merely isolated cases of brutality by individuals or undisciplined units, but acts committed on instructions from the German high command. On Oct. 12, 1942, Molotov in reply to a collective note from the other Allied powers, stated that "the soviet government approve and share the desire expressed in the collective note received by them to hand over to justice and put on trial those guilty of the aforesaid crimes," and were prepared "to support any practical steps taken by the Allied and friendly governments to this end." A fortnight later *Pravda* was editorially suggesting that a beginning might be made by placing Rudolf Hess, who was in the hands of the British government, on trial immediately. On Nov. 4 it was announced that the soviet government had instituted a special commission to investigate the damage to life and property resulting from the German occupation and to identify the guilty persons wherever possible. The chairman of this commission was to be the trade union leader, Nikolai Shvernik; and among its members were Professor Tarle, Professor Burdenko, Alexei Tolstoy the writer, M. Krainin, an authority on constitutional law, and the metropolitan (bishop) of Kiev and Galitsk.

Foreign Relations.—In the sphere of external relations with other powers, the final weeks of 1941 had witnessed the visit of the British foreign secretary, Anthony Eden, to Moscow, where in a series of meetings with Stalin and Molotov there took place an "exhaustive exchange of views on questions relating to the conduct of the war and postwar organization of peace and security in Europe," in the course of which "identity of views" was reached between both parties. On his return to England, Eden was accompanied by the soviet trade union leader, Nikolai Shvernik, with a soviet trade union delegation, to pay a return visit following that of Sir Walter Citrine and British trade unionists to Moscow a few months before. Six months later, Eden was able to inform the house of commons of the signature of a new treaty of alliance, collaboration and mutual assistance between Great Britain and the U.S.S.R., extending over a period of 20 years. This was signed in London on May 26, 1942, following the arrival of Foreign Commissar Molotov in England five days previously and a series of what Eden described as "long and friendly exchanges of views with M. Molotov," in the course of which "complete mutual confidence was established." Three days after the signature of the treaty, Molotov arrived in Washington, where he stayed at the White House as guest of Mr. Roosevelt. The first fruit of these Washington conversations was the signature on June 11 of a "master lend-lease" agreement between Cordell Hull and Maxim

ANOTHER WINTER WITH AN UNCONQUERED RUSSIA?

PROSPECT OF A SECOND WINTER for Hitler's troops in Russia in 1942-43, as envisaged by Orr in the *Chicago Tribune*, in his cartoon entitled "Still No Fur Coat"

Litvinov, the soviet ambassador. On the same date General Sikorski, the head of the Polish government in London, issued a statement welcoming the British-soviet treaty.

The chief clauses of this historic Anglo-soviet treaty provided that the two countries should "undertake to afford one another military and other assistance and support of all kinds in the war against Germany and all those states which are associated with her in acts of aggression in Europe"; affirmed that "the High Contracting Parties undertake not to enter into any negotiations with the Hitlerite government or any other government in Germany that does not clearly renounce all aggressive intentions, and not to negotiate or conclude except by mutual consent any armistice or peace treaty with Germany or any other state associated with her in acts of aggression in Europe"; and declared the desire of both countries "to unite with other like-minded states in adopting proposals for common action to preserve peace and resist aggression in the postwar period," . . . "to work together in close and friendly collaboration after the re-establishment of peace for the organization of security and economic prosperity in Europe," and "to render one another all possible economic assistance after the war." The foreign office statement which accompanied the announcement of the treaty stated that "full understanding was reached between the two parties with regard to the urgent tasks of creating a second front in Europe in 1942."

It soon became clear that in the U.S.S.R. very high hopes were placed on the immediate opening of a second front in Europe as the most important immediate fruit of the treaty. As far back as Feb. 1942 Litvinov (who in the previous November had been appointed ambassador to the United States and deputy-commissar for foreign affairs) made a statement in New York city that "only by simultaneous offensive operations on two or more fronts can Hitler's armed forces be disposed of," and promising that if a second front were opened soviet armies would "continue to strike at Hitler's armies to the limit of their strength and beyond that limit." *Pravda,* in welcoming the new treaty, declared that "the soviet people welcomed with tremendous approval the news of the full understanding with regard to the urgent tasks of opening a second front in Europe in 1942," and declared that "this year of 1942 must be the year of the final defeat of Hitler's hordes." In the course of the summer, when the German offensive made new inroads into soviet territory, and for a time seemed to threaten both the Volga region and the Caucasus, anxiety and impatience grew in the U.S.S.R., and turned to evident disappointment that the second front in the west had not yet appeared. In August Mr. Churchill paid a visit to Moscow to confer with Stalin himself, and in the words of the official statement "discussions were carried on in an atmosphere of cordiality and complete sincerity," and "a number of decisions were reached covering the field of war against Hitlerite Germany and her associates in Europe." On Oct. 3, in a written reply to Henry Cassidy, the representative in the U.S.S.R. of the Associated Press, who had asked what place the possibility of a second front occupied in soviet estimates of the current situation, Stalin stated: "A very important place: one might say a place of first rank." To a further question regarding Allied help to the U.S.S.R., Stalin said: "As compared with the aid which the soviet union is giving to the Allies by drawing upon itself the main forces of the German fascist armies, the aid of the Allies to the U.S.S.R. has so far been little effective. In order to amplify and improve this aid only one thing is required: that the Allies fulfil their obligations fully and on time." As regards soviet military strength, Stalin went on to strike a note of sober confidence: "I think that the soviet capacity to resist the German brigands is in strength not less, if not greater, than the capacity of fascist Germany or any other aggressive power to secure for itself world domination."

After the combined U.S.-British operations in North Africa were launched Nov. 8, Stalin addressed another letter to Cassidy in which he declared that the effect of the new campaign "will not be a small one and that a certain relief in pressure on the soviet union will result in the nearest future. . . . The campaign changes radically the political and war situation in favour of the Anglo-Soviet-American coalition. . . . There need be no doubt that the Red army will fulfil its task with honour. . . ."

With regard to Japan, 1942 saw the maintenance of the soviet treaty of neutrality of the previous year, and in March a renewal for a further year of the 1928 fisheries convention between the two countries; Japan agreeing to a 20% increase of rentals and to abstain from submitting tenders in respect of five out of the 19 fishing districts in which leases expired in 1941. At the close of 1941, Maxim Litvinov, at a press conference, had felt no hesitation in classing Japan as "a common enemy," at the same time stating that "complete understanding exists or will be arrived at" between the Allied powers, that "we are all in the same boat and will perish or triumph together," and that the axis powers as a whole were "a bunch of international gangsters, with Hitler the chief inspirer and culprit." On April 13, 1942, the anniversary of the soviet-Japanese neutrality pact, *Pravda* made an important editorial declaration. While declaring that the pact had been useful, it proceeded to give the warning that "it is necessary that the Japanese military fascist clique, dizzy with military successes, should understand that their blabbering about war and invasion in the north might damage Japan herself most of all." The pact, it said, had been put to "severe tests" by Japan's renewal of the anti-comintern agreement, "openly directed against the U.S.S.R., and by her attack on Britain and America" . . . "If the pact has held hitherto, it is because of the strict observance of all obligations by the U.S.S.R. If it is to be maintained in the future, it is essential that Japan should act similarly."

Among government changes and appointments in the U.S.S.R.

in the course of the year: in May, Y. A. Malik was appointed ambassador to Tokyo in succession to Constantin Smetanin; in February Lazar Kaganovitch, commissar for railways, was added to the State Defense council; in August General Zhukov, commander-in-chief on the central front, was appointed first-deputy to Stalin as commissar for defense. On Feb. 5 an agreement was signed in London between Ambassador Maisky and Vincent Massey for an exchange of consular representatives between Canada and the U.S.S.R.; and on June 12 a further agreement for an exchange of ministers was concluded. On Sept. 9 it was announced that the representatives in Moscow of the emigré Norwegian, Czech and Yugoslav governments would assume ambassadorial rank; and on Oct. 10 the U.S.S.R. extended formal recognition to the Fighting French. (*See* also WORLD WAR II.) (M. Do.)

Education.—Elementary and secondary school children in the educational year 1941–42 were estimated to reach a total of approximately 36,200,000 (an increase of 3.4% over the 1940–41 total); the number of university students was estimated at 657,000 for 1941–42 (an increase of 13%); libraries (1940), 75,000 with 160,000,000 books; newspapers, 9,000 (in 70 languages), with a circulation of 38,000,000; printed books, 700,000,000 copies. Theatres, 790; cinemas, 30,461 in towns and 18,991 in villages.

Finance, Banking, Trade.—Estimates for 1940: Capital investments in industry, agriculture and transport from the all-union budget and other sources, 36.1 milliard roubles (15% increase over 1939). State revenue, 182,600,000,000 roubles (17.1% increase over 1939); state expenditure, 179,700,000,000 roubles (including defense services, 57,066,200,000; national economy 57,117,500,000; cultural services, 42,875,400,000, of which education, 23,195,000,000). Banks: 37,120 branch banks and agencies; deposits in savings banks, *c.* 7,000,000,000 roubles. Subscription to third five-year plan loan, 9,310,800,000 roubles. Gross retail trade turnover in 1939, 163,456,000,000 roubles. Foreign trade figures were not available for 1939, 1940, 1941 and 1942. Merchant marine (vessels of 100 tons and over) (1939) 1,316,000 gross tons.

Agriculture, Manufacturing and Mineral Production.—(Metric tons) Grain crops (1938): wheat 40,880,000; rye 20,930,000; oats 16,990,000; barley 8,200,000; maize 2,690,000; rice 317,000; potatoes (1938) 41,960,000; beet sugar (1940) 2,145,800; tea (1940) 12,900; cotton (1940) 800,000; cotton seed (1940) 1,720,000; wool (1938) 137,400; flax (1939) 633,000; hemp (1939) 110,000; raw silk (1940) 1,700; rayon (1940) 7,700; wood pulp (1938) 10,800,000; crude petroleum (1940) 29,700,000; natural gas (1938) 2,600,000,000 cu.ft.; coal (1940) 146,800,000; iron ore (metal content) (1940) 14,000,000; pig iron and ferro-alloys (1940) 14,950,000; steel ingots and castings (1940) 19,100,000; manganese ore (metal content) (1940) 1,300,000; bauxite (1938) 250,000; aluminum (1940) 55,000; chrome ore (1940) 96,000; silver (1938) 218,000; gold (1937) *c.* 150,000 kilograms.

Industry and Labour.—While the total population of the U.S.S.R. increased by 16% between 1926 and 1939, skilled workers and intellectuals increased by the following number of times: mechanics 3.7, turners 6.8, millwrights 13.0, locomotive drivers 4.4, plasterers, 7.0, tractor drivers 215.0, engineers 7.7, agronomists 5.0, scientists 7.1, teachers 3.5, physicians 2.3.

The social composition according to the 1939 census returns was: workers and employees 49.7%; peasants on collective farms and handicraftsmen in producers' co-operatives, 46.9%; independent peasants and handicraftsmen, 2.6%; nonworkers, 0.04%; groups not shown, 0.7%.

Unitarian Church.

A major event in the gradual integration of denominational machinery and program was the significant action by the Laymen's league in taking responsibility for the United Unitarian appeal, and the appointment of Frederick T. McGill to be both executive director of the league, and head of the appeal.

Significant as a movement within the Unitarian body was a "Statement of Faith," drawn up by ministers of the Middle Atlantic states, to define the faith needed for these times: faith in man, exemplars and prophetic leadership, freedom, the validity of moral choice, free churches and God. A study course was prepared for use in Unitarian churches and it was expected that there would be general consideration of the statement throughout the denomination.

During 1942 the Unitarian War Service council was organized and it embarked upon extensive service in three directions—to Unitarian chaplains with the armed forces, to men and women in the service who sought religious inspiration and guidance, and to the churches in their effort to serve more effectively in the present crisis. The council published a series of leaflets which had very wide distribution among the men in the service.

The work of the Unitarian Service committee continued in France and Portugal with growing effectiveness. The invasion of Unoccupied France compelled the removal of U.S. representatives to Geneva, but apparently the work in Marseilles, at least, continued. Dr. and Mrs. Robert Dexter went to Portugal late in the summer, and were in charge there at the close of the year. On the home front, the work of the Unitarian Service squads grew, and a committee inaugurated a program to mobilize churches in co-operation with the child care project of the Office of Civilian Defense. A branch office of the service committee was opened in New York city.

Two significant books were published by the association: *American Destiny*, by A. Powell Davies; and *Realistic Courage*, by Walton E. Cole. The latter was given originally as the first series under the Minns lectureship established in Boston for an annual series of lectures by Unitarian ministers, under the charge of the First Church in Boston and King's Chapel. Also, several new volumes were added to curriculum material of the department of church schools. (*See* also CHURCH MEMBERSHIP.) (J. H. L.)

United Church of Canada.

The United Church of Canada, which in 1925 united the Presbyterian Church in Canada, the Methodist Church (Canada) and the Congregational Churches of Canada, reported for 1941 a membership of 716,920 with 1,737,893 persons under pastoral oversight; a Sunday school enrolment of 510,602 and 7,109 preaching places. The Church owned property worth over $85,548,413 and raised a total of $11,991,680 for all purposes. In foreign missionary fields, where work was interrupted, it appeared improbable that work could be resumed in the exact forms in which it was carried on before the war. The missionary and maintenance givings of the church showed an increase of $33,000 over those of 1940. To date in gifts and pledges of war savings certificates given over to the church, $1,119,000 was received which would have a maturity value of $1,398,750.

Among the important features in the life of the United Church during the year were the creation of a board of colleges and secondary schools to take over and administer an important phase of educational work formerly under the board of Christian education, leaving the latter to deal exclusively with the oversight of Sunday schools and young peoples' societies; the setting up of a board of finance under a federated type of constitution embracing the department of the treasury, the missionary and maintenance department and the department of pensions; the setting up of a committee to outline a plan to secure support for the pension fund by a system of assessments upon pastoral charges instead of by an annual grant from the missionary and maintenance fund; the acceleration of the theological course as a war measure in order to keep home mission charges better supplied with ministers, and the adoption of a plan in a few areas adjacent to theological colleges to form collective pastoral charges by combining two or more rural or suburban charges which would be served by an ordained minister assisted by students pursuing their theological training.

About 155 ministers were serving as chaplains to the Canadian armed forces. About 20 ministers served in the auxiliary services of the Canadian Legion and the Y.M.C.A.; 16 were listed as combatants, making a total of 191. There was a serious shortage of ministers for the normal work of the church.

The Rev. Victor T. Mooney was elected treasurer of the United Church to fill the place made vacant by the death of Rev. Robert Laird. Rev. J. C. Cochrane was appointed secretary of the department of pensions as successor to Rev. S. W. Dean who retired. The Rev. J. R. P. Sclater of Toronto was elected moderator of the church by action of the general council which met in September. (G. A. Si.)

United Service Organizations.

United Service Organizations, Inc. was formed in Feb. 1941 to provide recreational, spiritual and welfare services to the armed forces outside military and naval reservations, and to certain war production workers specified by the government. With the approval of the president and the war and navy departments, six national welfare agencies pooled their resources to form U.S.O.: The Young Men's Christian associations, the National Catholic Community service, the Salvation Army, the Young Women's Christian associations, the Jewish Welfare board and the National Travelers Aid association.

Actual development of U.S.O. quickly outstripped the original plan; 201 buildings were eventually provided by the government, but by Dec. 7, 1941, U.S.O. had 496 operations, and a year later, 1,127. Additional buildings were rented, borrowed and accepted as gifts. Operations fell into the following principal classifications (figures as of Dec. 7, 1942):

U.S.O. Clubs, numbering 673, supplying recreation facilities outside military camps and naval stations for the armed forces in their off-duty hours. Supplementing the clubs in communities in which need for full U.S.O. service was limited or delayed were 213 U.S.O. centres and area services.

Travelers Aid Service, operating 95 stations to supply information or emergency aid and counsel to troops-in-transit in railroad and bus terminals and supplementing the facilities provided by 88 U.S.O. lounges for reading, writing, resting and obtaining various needed personal services.

Mobile Service Units carrying U.S.O. comforts and entertainment to soldiers and sailors on detached duty at outposts remote from regular U.S.O. service and to troops on manoeuvres.

The Overseas Division in 1942 operated 57 U.S.O. clubs, 21 U.S.O. centres and area services and 10 mobile service units, in 56 cities and towns and 16 territories, possessions and off-shore bases in the western hemisphere.

U.S.O.-Camp Shows, Inc., one of the largest theatrical enterprises in history, with 86 units touring three separate circuits. In 1942 they strove to produce at least one performance every fortnight in every camp or base in the United States.

Nationally financed operations of U.S.O. in the continental United States were conducted in 476 cities and towns in 47 states and the District of Columbia in 1942. Affiliated local operations co-operating with U.S.O. were also conducted in more than 500 other communities.

U.S.O. in 1942 employed upwards of 6,000 paid workers on its professional staff; their work was supplemented by the efforts of more than 600,000 volunteers. U.S.O. was financed entirely by public subscription: $14,353,666 was raised in the 1941 campaign, and more than $31,000,000 had been raised in the 1942 War Fund campaign up to Jan. 1, 1943.

U.S.O. War fund officers in 1942 included John D. Rockefeller, Jr., honorary chairman, and Prescott S. Bush, national campaign chairman. Walter Hoving was chairman of the board, and Chester I. Barnard, president of the U.S.O. national administration. National headquarters were located in the Empire State building, New York city. (C. I. B.)

United States.

The population of the United States in 1940, by the federal census, was 131,669,275. This figure represented an increase of 8,894,229 over the census of 1930. With possessions included, the population was 150,621,231 in 1940. On Jan. 1, 1942, the census bureau estimated the population of the U.S. proper at 133,965,237. The area of continental U.S.A. is 3,022,387 sq.mi. For population figures of the states, *see* the articles on the separate states. *See* also Birth Statistics; Census, 1940; Church Membership; Death Statistics; Indians, American; Negroes (American). (X.)

History.—On the first day of 1942 there was signed at Washington a Declaration of the United Nations, by which 26 nations (later increased to 30), representing a population of more than 1,000,000,000, joined in the pledge to fight together until the overthrow of the tyrannical regimes of Hitler, Mussolini and Hirohito was accomplished. For the winning of the war the whole machinery of the United States was increasingly geared: industries, agriculture, labour relations, transportation, military and naval establishments, shipbuilding, taxation, investments, and hundreds of adjustments and sacrifices in the private lives of U.S. citizens, like the rationing of food, gasoline and fuel, the deprivation of household conveniences and various consumers' goods, in order that the factories might concentrate on war production, and the pressure to put every spare dollar into the purchase of bonds and stamps to help the treasury meet the fabulous expenses of the war.

Congress.—The second session of the 77th congress, with a Democratic majority of 104 in the house and 38 in the senate, convened on Jan. 5, 1942, and adjourned on Dec. 16, after a continuous session (barring a brief recess at the end of April) of 344 days—the longest in U.S. history. On the 6th of January it listened to the president's message which called for the production of 60,000 planes, 45,000 tanks and 8,000,000 tons of shipping for the year 1942, with those figures stepped up to 125,000, 75,000 and 10,000,000 respectively for the year 1943. The president declared that the war would take more than half the estimated national income for 1942 and that American armed forces would operate in every theatre of war where their help was needed. It would obviously be impossible in the space of this article to give a detailed account of the legislation of the session, since the proceedings of the 77th congress fill 32 volumes in the *Congressional Record.* But the following acts may be cited as outstanding. A Price Control act of January conferred on Leon Henderson's Office of Price Administration wide powers of ceiling fixing to check inflation, but failed to deal with wages or agricultural prices, until the latter were brought under the law by an eleventh hour amendment after the president had threatened in his Labor day message to act on his own authority if congress did not take action before Oct. 1. As a result of 10 months of struggle congress enacted a tax bill designed to raise $9,000,000,000 in new levies, thereby increasing the total federal tax burden to some $27,000,000,000, a figure in excess of the public debt at the close of World War I. At the same time the debt limit, which had been set at $65,000,000,000 in 1941, was raised to $125,000,000,000, with the certainty that even this enormous figure would have to be revised upward before long. A navy bill of $26,500,000,000 in February and an army bill of $32,000,000,000 in March, together with supplementary demands of $11,000,000,000 for the air corps, $8,000,000,000 for additional fighting ships below the battleship class, 500,000 tons of aircraft carriers, and constantly increasing sums for the equipment and service of the rapidly growing armed forces, carried the total appropriations and authorizations of congress above the $220,000,000,000 mark before the close of the session. Under the Selective Service act of 1940 some 17,500,000 men between the ages of 21 and 35 had been registered. The act was extended in Feb. 1942 to include 9,000,000 in the age limits 36–45; in April to register 13,000,000 more between the ages of 46 and 65; and in June to include 3,000,000 boys of the "teen age" (18–20). Thus a grand total of more than 42,000,000 males had been registered for service in the fighting forces or in war production. This compared with a total of 24,234,000 men between the ages of 18 and 45 enrolled in the four drafts of World War I, of whom only 4,335,000 were mobilized and 2,800,000 drafted for combat. In addition, congress authorized the establishment of uniformed women's auxiliary corps in the army (WAAC), the navy (WAVES) and the coast guard (SPARS), to replace the tens of thousands of men called from clerical and other noncombatant work to serve in the ranks. (*See* also SELECTIVE SERVICE.)

In general, congress responded willingly to the president's requests for the authorization and support of the multifarious boards and commissions which he was setting up for the coordination of the war effort, though a senate committee under Chairman Harry Truman of Missouri found much to complain of in the matter of dilatoriness and red tape in the management of the war. There were more than 50 federal agencies in June 1942, of which perhaps the most important were the National War Labor board (William H. Davis), the Office of Price Administration (Leon Henderson, resigned in December), the War Manpower commission (Paul V. McNutt) and the War Production board (Donald M. Nelson). Later in the year many of these half a hundred agencies were either discontinued (the CCC, the NYA, the WPA, for example) or were merged with a new and more comprehensive agency like the Office of War Information (Elmer Davis), while still other agencies were created, like the Food administration under the wide authority of Secretary of Agriculture Claude R. Wickard, the Office of Economic Stabilization, to head which Justice James F. Byrnes resigned from the supreme court, and an agency for foreign relief and rehabilitation, similar to that of Herbert Hoover in World War I, under the chairmanship of ex-Governor Herbert H. Lehman of New York. Two war powers bills had been passed by congress, giving the president authority (as in the Overman act of 1918) to shift departmental agencies as he saw fit, to control alien property, manage war production contracts, censor communications and exert a large control over raw materials. Congress, however, balked at the third war powers bill, which would have given the president control over the tariff and immigration, and adjourned without action thereon.

THE ALL-AMERICAN GIRL REVUE toured U.S. camps in 1942 to entertain soldiers, often in conjunction with the United Service organizations. Here Shirley Lloyd, a member of the company, sings at Fort Benning, Ga.

There was a great deal of criticism of congress during the year, directed at the alleged subserviency of that body to powerful groups like the farm associations and the labour lobbies demanding privileges for their respective interests; and public indignation was so prompt when congressmen voted pensions for themselves in Nov. 1941 that the "Bundles for Congress" act was repealed in the spring of 1942 by large majorities in both houses. Another complaint against congress was the filibuster conducted by a group of southern senators against the abolition of the poll tax as a requisite for voting in the eight southern states in which it was still in force. In the last days of the session congress increased the pay of the soldiers from $21 to $50 a month and granted substantial pay raises to more than 1,000,000 employees in the federal service. Early in June congress declared war on three Balkan satellites of the axis, Hungary, Rumania and Bulgaria.

The Budget.—On Jan. 7 the president presented his budget message to congress. He called for a budget of $59,000,000,000 for the fiscal year 1942–43, of which $53,000,000,000 (89%) was for war expenses, against estimated receipts of $17,852,000,000. "Bonds and taxes, taxes and bonds," was his slogan. By the end of the fiscal year the U.S. government was spending at the rate of $150,000,000 a day, but taxes were bringing in only $49,000,000 a day. It was estimated that the fiscal year 1943 would see expenditures of $73,000,000,000 against receipts of approximately $27,000,000,000, leaving a deficit of $50,000,000,000. After Pearl Harbor the daily rate of war expenditure rose from $70,000,000 to $150,000,000, or $1.15 for every man, woman and child. The total $220,000,000,000 earmarked for war expenses after 1940 exceeded the whole cost of the government (including its five major wars) since 1789 by $66,000,000,000. In the peak year of World War I, the war expenses were 9.5% of the national income of $56,750,000,000; in 1942 they were 45% of the income of $116,000,000,000. It was evident that the major part of the enormous expense of the war (far more than the two-thirds to which congress tried to hold it down in World War I) would have to be met by borrowing, despite the heaviest tax bill ever levied in U.S. history. According to this 1942 tax bill 16 persons would be liable to income taxes as against 1 person in 1917, and the rate for a single man's income of $2,000 would be $287.50 as against $20 in 1917. From the higher brackets the government expected to take approximately one-half of a $50,000 income and so on up to 90% of a $1,000,000 income. President Roosevelt urged that no one be allowed to have an income of over $25,000 after all taxes were paid.

The Problem of Inflation.—No problem of domestic concern received more serious and constant consideration during the entire year than that of inflation. It was the subject of repeated warnings by the president, the Office of Price Administration, congress, economists, editorial writers and cartoonists. In brief, it is the problem of keeping the cost of living (prices) as fairly as possible adjusted to the situation created by an unprecedented amount of purchasing power (money, credit) in the hands of the people, together with a constant diminution of the consumers' goods available for them to buy. The government was issuing billions of new currency in the form of bonds to finance the war, and this money, paid out in wages, salaries and profits, was increasing the national income by leaps and bounds. At the same time the government was taking more and more of the products of mills, factories and farms for war purposes, and restricting or completely stopping the production and sale of articles that the public would like to buy, such as automobiles, refrigerators, vacuum cleaners, typewriters, coffee, sugar, fuel oil, and a hundred other commodities. Out of an estimated $116,000,000,000 of national income in 1942, taxes will take some $27,000,000,000, leaving $89,000,000,000 of purchasing power in the hands of the people; while the amount of goods available for purchase will not exceed $69,000,000,000. This discrepancy of some $20,000,000,000 (which is constantly growing wider) is the "inflationary gap" which the administration was striving to close.

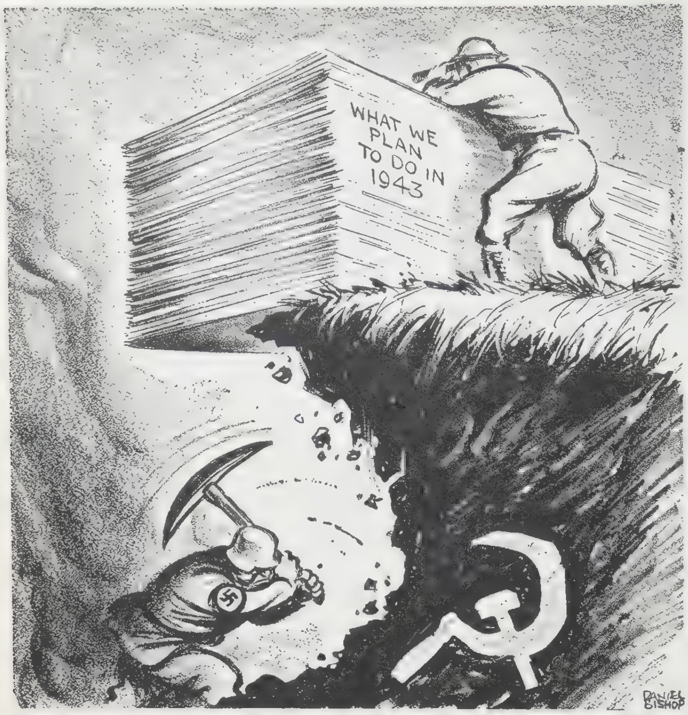
Many remedies were proposed during the year 1942 to check inflation. The Price Control act of January, already mentioned, put ceilings on the prices of some 30,000 articles, but failed to touch wages or to limit farm prices to a figure below 110% of parity. Administrator Henderson declared that the act was inadequate to prevent the cracking of the ceilings. And while no such runaway inflation as that of World War I resulted, the cost of living rose 17%, of wages 57%, and of farm products 72%. On April 27 President Roosevelt presented a seven-point program to close the inflationary gap. His principal recommendations were: (1) higher taxes to siphon off some of the excess purchasing power of the public; (2) increased investment in war bonds (which are savings, not spendings); (3) the rationing of scarce commodities, to prevent a competitive scramble for them; (4) stabilization of wages; and (5) a curb on rising farm prices. The following evening, in a fireside chat to the American people, the president asked them to co-operate by ceasing to buy on credit, paying off their debts, multiplying their subscriptions to war bonds, and accepting the deprivation of customary conveniences and comforts with good grace. "The price of civilization," he warned, "must be paid in hard work, sorrow and tears"—echoing Winston Churchill's famous formula of the spring of 1940.

Industry.—At the beginning of the year President Roosevelt announced that half of the industrial production of the country would be needed for war purposes (as against one-sixth in 1941). The $56,000,000,000 budget for the war meant a production program of more than $1,000,000,000 a week and "the conversion of the world's greatest peacetime industrial machine into the mightiest wartime arsenal." The efficiency with which this enormous task was tackled is shown by the output achieved in the 12 months after Pearl Harbor. A labour force increased from 7,000,000 to 17,500,000 war workers produced $47,000,000,000 of war material, including 49,000 planes, 32,000 tanks, vast quantities of guns and ammunition, 8,000,000 tons of merchant shipping, and great additions to naval equipment. By midsummer of 1942 the United States was manufacturing 4,000 planes a month, as compared with 200 a month in 1939, and the output of machine tools had grown from $200,000,000 to $1,200,000,000. Before entrance into the war and the rapid successes of Japan which followed, many manufacturers had been reluctant to convert their plants for war production, believing that they could still make automobiles and other consumers' goods while devoting a part of their facilities to war work as a side line. They were anxious to keep their regular business going, against the day when normal production would return with the peace. But the growing realization that the U.S. might lose the war unless the total resources of the country were enlisted in the effort brought a change of heart. The Truman committee's report of Jan. 1942 revealed the seriousness of the situation. The new War Production board under Donald M. Nelson was given wide powers of control over the raw materials, processes and allocations of manufactured products. As the tempo of war increased and millions of men were withdrawn from the normal working population to serve in the armed forces, the problem of manpower became acute. A War Manpower commission was set up in April under the chairmanship of the Federal Security Administrator Paul V. McNutt. The commission, which consisted of representatives from the War Production board, the Selective Service system, the Civil Service commission, and the departments of war, navy, labor and agriculture, was charged with the tremendous task of finding among the 70,000,000 men and women who can be recruited for war work able bodied workers to furnish the rapidly mounting volume of materials demanded by the War Labor board, as well as to supply labourers for the 6,000,000 farms of the country.

Meanwhile, the accomplishments of industry in the first year of war were little short of miraculous. To take the production of planes alone, the tonnage of aircraft output after Pearl Harbor tripled and a greater number of planes were built than in all the 23 years preceding 1942. Man-hours worked in the production of planes, engines and propellers increased 155%, and the value of aircraft turned out in the year was $4,250,000,000, as compared with $1,650,000,000 in 1941. The number of women employed in the industry rose from 4,300 to 115,000. An analysis of other industries, like agriculture, transportation and shipping, would tell a like story.

CRATER made by a 5-in. "dud" shell from a Japanese submarine which bombarded the oil fields at Ellwood, Calif., Feb. 23, 1942

Labour.—One of the most striking testimonies to the spirit of unity which pervaded the nation after the disaster at Pearl Harbor was the change in the attitude of organized labour. Early n the new year labour-manager conferences agreed that there should be no strikes or lock-outs for the duration of the war and hat all labour disputes should be settled by peaceful means. To mplement this policy the president appointed a War Labor board (to take the place of the National Defense Mediation board, which had broken down on the issue of the closed shop), consisting of four members from the ranks of labour, four industrialists, and four members representing the public. Under its chairman, William H. Davis, that board was to have jurisdiction over all labour disputes and to settle them either by mediation or arbitration (compulsory, if necessary). Owing to the co-operation between labour and management, the country was spared the disgraceful record of 1941, when strikes involving 1,300,000



WHAT WE PLAN TO DO IN 1943
DANIEL BISHOP

"THE RAMPARTS WE WATCH." A prophecy of 1942 by Bishop in the *St. Louis Star-Times* of what would befall U.S. "paper plans" in the event of Russia's defeat by the Germans

workers and costing the country 15,000,000 man days of labour affected electrical, steel, copper, aircraft and harvester plants, many of which had millions of dollars worth of government defense contracts. In the summer and autumn of that year United States troops had to take over the North American Aviation company's plant at Inglewood, Calif.; the navy took over the Federal Shipyards plant at Kearny, N.J.; and Colonel Jones of the army was put in charge of an aeroplane factory at Bendix, N.J. So serious was the situation that Representative Ford of Washington proposed a bill in congress to make strikes in defense industries punishable with imprisonment for 25 years. In contrast to this distressing record, the bureau of labor statistics reported in April 1942 that 99.97% of the workers in war industries had not lost an hour through strikes.

This does not mean that the War Labor board was free from criticism by both labour and management, or that harmony prevailed in the ranks of organized labour. John L. Lewis, who had resigned from the presidency of the C.I.O., but was still the head of the powerful United Mine Workers, proposed in January that both William Green and Philip Murray should resign from the presidency of the A.F. of L. and the C.I.O. respectively, to be replaced by George Meany, the Secretary of the A.F. of L., while he himself should be vice-president of the new consolidated organization. Naturally, both Green and Murray turned down the proposition, and President Roosevelt provided the compromise of a "labour cabinet" consisting of three members of the A.F. of L. and three of the C.I.O. (not including Lewis) to consult with him on questions relating to labour's part in the war effort. The threat of Lewis to take the U.M.W. out of the C.I.O. as the nucleus of a third labour group probably influenced the older organizations to come closer together. For in April, before a gathering of 5,000 at Pittsburgh, Green and Murray gave a joint pledge of uninterrupted war production by the workers of the A.F. of L. and the C.I.O. At the same time the United Automobile, Aircraft and Agricultural Implement Workers (representing 700,000 men) agreed to refrain from strikes, to waive double pay for Sunday and holiday work, and to accept war bonds for overtime pay if profits were restricted. But these offers were coupled with demands that there be no war millionaires and no inflation, that security for dependents of men in the services be assured, and that there be a moratorium on the debts of these men and of the unemployed.

A heartening sign of harmony between the two great labour organizations was the meeting on Dec. 2 of peace commissioners of the A.F. of L. and the C.I.O. who agreed to submit all jurisdictional disputes to arbitration and to cease mutual raiding of labour—at least for the duration of the war. It was the first peace document formulated by the two organizations since the split caused by the secession of the C.I.O. in Nov. 1935. More harmonious relations between capital and labour were signalized by a remarkable meeting which occurred late in July. At the invitation of Eric Johnston, the new president of the United States Chamber of Commerce (regarded as the citadel of big business), Messrs. Green, Murray and Meany met Johnston and William Witherow, president of the National Association of Manufacturers at Washington, and after a conference with President Roosevelt they agreed to work together for increased production and sustained employment.

A crisis was threatened, however, in this same month of July by the demands of the 157,000 workers in "Little Steel" (the Republic, Bethlehem, Inland and Youngstown plants) for a dollar a day increase in wages. When the War Labor board granted these men a raise of 44 cents a day, as an offset to the 15% rise in the cost of living, it was widely criticized, not because the amount involved was large, but because the decision might serve as a precedent for demands from the millions of steel workers in the automobile and aircraft factories. On the subject of hours, too, there was a good deal of agitation through the entire year. It was argued that adherence to the basic 40-hr. week established by the Wagner legislation of the New Deal was costing the government billions of dollars; and there were proposals to abolish it in war industries for the duration of the war, to limit profits to 6% on all war contracts over $10,000, and to outlaw the closed shop. The Wagner Wages and Hours act did not, as a matter of fact, limit the hours of labour to 40 a week, but only provided that work beyond these hours should be paid at a 50% higher rate. Actually, men in the machine tool and plane engine plants were working about 55 hrs. a week, and in the aircraft factories 49 hrs. The average working week in 70% of the war industries in 1942 was 48 hrs. It was not really a question of hours but of pay that concerned the workers. To abolish the basic 40-hr. week would mean for them the loss of overtime wages, and this seemed grossly unfair to them at a time when the managers were reaping large profits and corporations were paying huge bonuses and salaries in order to avoid taxation on excess profits. Neither the president nor Mr. Nelson was in favour of abolishing the 40-hr. week, believing that the nation could better afford to pay the cost of overtime labour than to impair the morale of the workers by going back on the privileges granted to them in the Wagner act. A compulsory 48-hr. week, they believed, would smack too much of "industrial conscription." (*See* also Strikes and Lock-outs.)

Agriculture.—The year 1942 was a banner year for American agriculture. Bumper crops of wheat (985,000,000 bu.) and corn (3,100,000,000 bu.) filled granaries. Green peas, potatoes, poultry, eggs, milk, pork, beef reached all time high levels. The total farm production was reported on Dec. 1 as 12% higher than in 1941, and the gross farm income had risen from $4,500,000,000 in 1932, $8,700,000,000 in 1939, and $11,700,000,000 in 1941 to over $14,000,000,000. In view of these figures it would seem that there was no cause to worry over food supplies; and indeed headlines in the newspapers spoke of "Plenty of Food for the United States," as a result of "the biggest, most diversified, most healthful, most vitamin-rich crop ever harvested anywhere by any people," while grocery stores advertised "Victory Food Specials" to dispose of surpluses of potatoes, onions, lettuce and fruits. But in spite of this optimistic picture, grave difficulties confronted the agricultural situation. By the close of 1942 the United States had shipped more than 6,500,000,000 lb. of foodstuffs to Great Britain, China and Russia, and the United States armed forces were consuming one-fourth of the U.S. meat supply. Already, by the end of the year, more than 2,000,000 people had left the farms to join the armed forces or to work in war industries, and it was thought that another million would go before the next harvest. This shortage of labour was partially met by the enlistment of women and school children, nevertheless a thousand acres of sugar beets, for example, were plowed under in California, fruit and berries were unpicked, vegetables left to rot on the ground and wheat lay unthreshed for lack of farm hands. Toward the end of the year Secretary of Agriculture Wickard was appointed National Food Administrator by President Roosevelt, "with full responsibility for and control over the nation's food problem"—a post ranking in importance with Nelson's War Production board, McNutt's War Manpower commission and Byrnes' Office of Economic Stability. On Dec. 27 Administrator Wickard announced over the radio that the rationing of canned fruits, soups and vegetables would begin in Feb. 1943, and that half of the U.S. production of these commodities would have to go to feed the men in the services. He assured the people that there would be no lack of dairy products, cereals, meat, poultry, fresh fruit and vegetables for civilian consumption, and warned against hoarding the rationed items since such hoardings would be deducted from the ration books. The selective service co-operated in the task of relieving the farm labour shortage by a liberal policy in deferring farm workers, and proposals were made for importing a large number of Mexicans to work in the fields. There was even talk, if conditions grew worse, of drafting agricultural labourers as men are drafted for military service.

"ALL TANGLED UP." The Laocoön of rubber and petroleum in 1942 as seen by Seibel of the *Richmond Times-Dispatch*

A third difficulty lay in the threatened shortage of the farm machinery on which the vast agricultural operation is dependent. The manufacture of new farm machinery was limited by the War Production board to 83% of the 1940 figure; and as the demand for steel became heavier and the current supply of machines and parts became exhausted it would be well nigh impossible to expand the agricultural program to keep pace with the mounting demands. Still other contingencies had to be faced, such as the possibility of adequate transportation to markets and storage centres and the continuance of the favourable weather conditions which spared the country the disasters of floods, droughts and dust storms which afflicted the country in the middle 1930s. (*See* also AGRICULTURE.)

Transportation.—*The Railroads.*—Ten days after U.S. entrance into the war President Roosevelt appointed Joseph B. Eastman of the Interstate Commerce commission as head of a new Office of Defense Transportation, with authority to "co-ordinate and direct domestic traffic movements . . . assuring the orderly and expeditious movement of men, material and supplies to points of need." Under Mr. Eastman's efficient management, with the hearty co-operation of their officials and train crews, the railroads did a magnificent job in 1942, despite serious handicaps. Although, owing to the depression years, they had 600,000 fewer freight cars, 15,000 fewer passenger cars, and 20,000 fewer locomotives at the beginning of 1942 than they had in 1918, they carried 30% more freight and 40% more passengers than in 1941. Besides sending more than 6,000 carloads of food and equipment a day to 150 government camps and war plants, and 1,000 carloads to ports for shipment to our Allies, they had to move an average of 1,000,000 troops a month, or more than four times the number moved in the first year of the last war. An additional burden was created by the shift from water to rail transportation of coal, oil and timber, due to the submarine toll of tankers and merchant ships along the Atlantic coast. For example, in Dec. 1941 the railroads were carrying only 70,000 barrels of oil a day to the eastern seaboard; but in Dec. 1942 they carried nearly 800,000 barrels daily. Rubber and gasoline shortage also threatened the bus and truck transportation, which had carried 60% as much as the railroads in freight and passengers during the year 1941. Many predicted that the railroads would not be able to overcome these handicaps and expected that the government would have to take them over as it did in 1918; but by constructing more powerful locomotives, doubling the speed and capacity of freight trains, eliminating cross haulings, requiring full carloadings and prompt unloadings, cutting down duplicating passenger service on competing lines, and urging the public to refrain from unnecessary travel, the railroads, in 1942, handled their tremendous job with marvelous efficiency and with little congestion at industrial plants or ports of shipment. (*See* also RAILROADS.)

Shipping.—An entirely different situation confronted the shipping effort. Indeed, it looked in the midsummer of 1942 as though the United Nations might lose the war through lack of the necessary ships to get American supplies to the far distant battle fronts. Whereas, in World War I there were hardly a score of German submarines operating at any one time in the Atlantic waters and from limited bases, in 1942 there were probably 500 submarines, some of them with a cruising range of 10,000 to 12,000 mi., and virtually the whole coast of western Eu-

rope was a submarine base. From February to June the U-boats took a toll of 313 ships, totalling nearly 3,000,000 tons off U.S. shores. They were sinking two or three vessels a day, while the nation had completed only 106 between January and April. The lag in building was due chiefly to the suspension of merchant ship construction from the end of World War I until 1938, when Admiral Emory S. Land was made head of a maritime commission (converted in 1942 into the War Shipping board). By the late spring of 1942 the program for a "Victory fleet" was showing encouraging results, with 66 ships of 732,000 tons constructed in June, as against 16 ships of 198,000 tons in January. National Marine day was celebrated in May by the launching in 24 hrs. of 27 ships. The 62 shipyards and 300 launching ways represented a five-fold increase over the year 1940, and the average time for the construction of a 10,000 ton Liberty cargo ship was reduced from the 234 days required in 1918 at the Hog Island yard to 105 days. The sensation of the year in shipbuilding was the achievement of Henry J. Kaiser, whose Oregon shipyard corporation produced a completed vessel in 3 days, assembling it from prefabricated parts instead of building it up from the keel. He claimed that he was also ready to undertake mass production of huge cargo planes.

The navy department was severely criticised during the year for not making more headway in curbing the submarine sinkings, which were responsible for the interruption of coastal transportation and the consequent shortages of coffee, cacao, sugar, oil, bananas and other commodities. It was argued that a stubborn adherence to established custom prevented the navy from using available small boats and private planes as auxiliaries to the blimps and craft on patrol duty. The demand was also made that more destroyers be used to combat the U-boats. But naval authorities were able to show the difficulties involved in the conversion of private craft for efficient service, and declared that destroyers could not be spared from convoy duty. It was distressing to lose merchant vessels, but it was less disastrous to have a tanker with a cargo of 10,000 tons of oil sunk on the way from the Gulf to New York than to have operations on the Asiatic or African fronts bogged down by failure to convoy the necessary equipment. The only answer to the problem was the construction of more and more ships, until the goal of 2,300 vessels with a tonnage of 23,000,000 set for 1942–43 was achieved. (*See* also SHIPPING, MERCHANT MARINE; SUBMARINE WARFARE.)

The Elections of 1942.—Politics were not "adjourned" in 1942, as President Wilson had advised in the spring of 1918. Beginning with Louisiana on Jan. 20, primary elections were held in all the states except Connecticut, Rhode Island and Delaware during the spring and summer, to select the candidates for the mid-term elections of Nov. 3, when the entire house of 435 members, 34 United States senators, 34 governors and many minor state officials were to be chosen. Since both Democrats and Republicans were agreed on the vigorous prosecution of the war, it seemed to many people that it would make little difference whether the Democrats retained their large majority in congress or not. But to the political leaders on both sides the contests appeared as one of the most important mid-term elections in U.S. history. Frank Gannett, the assistant chairman of the Republican National committee declared in a radio address that a Republican victory was necessary for clearing up the "mismanagement, bungling and confusion in Washington," where bureaus had been piled on bureaus and hundreds of thousands of government employees were falling over one another trying to unravel one another's red tape. A Republican congress would, he said, compel a house cleaning, drive out the incompetents and ensure the victory of the United Nations. On the other hand, Senator Thomas of Utah called attention to the sabotaging of President Wilson's program by a Republican congress in 1919 and predicted that a Republican victory in 1942 would impede the war effort and endanger the coming peace. Furthermore, since the new 78th congress would last until Jan. 1945, it would, argued the Democrats, have extremely important matters to decide should the war be over by that date. What, for example, would be its attitude toward the continuance of the international co-operation urged by President Roosevelt and Prime Minister Churchill? Would it support or seek to liquidate the measures of the New Deal? The vote on November 3 returned 222 Democrats and 209 Republicans to the House, a Republican gain of 47 seats; and the new Senate would count 57 Democrats and 38 Republicans, a gain of 9 seats for the latter, counting one Progressive. The Republicans also gained three governorships, the most notable being the victory in New York of District Attorney Thomas E. Dewey (who had nearly defeated Governor Herbert H. Lehman in 1940) over chairman Farley's candidate, Attorney General John J. Bennett. The veteran Senator George W. Norris of Nebraska was defeated after a continuous service of 39 years in congress.

The Army and Navy.—By the close of 1942 the armed forces of the United States numbered approximately 5,000,000 men, of whom 3,600,000 were in the army, close to 1,000,000 in the navy, together with the Marines and the Coast Guard. The technical structure of these forces is too complicated to be described in detail here. For example, in the army reorganization of March there were three great agencies under the overall command of General George C. Marshall, Chief of Staff. The Ground Forces (General L. J. McNair) comprised the armoured tank force, the field artillery, the engineers, the cavalry and the infantry. The air force (General H. H. Arnold) consisted of various types of bombing, pursuit, transport and observation planes. And the service of supply (General B. B. Somervell) included the quartermaster corps, the ordnance department, the medical department, the signal corps and the chemical warfare service. While the navy was naturally expected to be ready to serve on all seas, it was expected, and pledged by both the political parties in the 1940 campaign, that the army would not be sent abroad. But in the summer of 1941 the president gained the grudging consent of congress (the vote was 203 to 202 in the house) to extend the time of the draftees to two and a half years, and later announced that American expeditionary forces would be sent wherever they were needed. The first one landed in Northern Ireland on January 26, 1942. By the end of the year 1,000,000 U.S. troops were engaged in more than a score of battle areas in Europe, Asia, Africa and the islands of the Pacific. There was a lively controversy over the kind of naval forces best suited to the winning of the war. Aviation experts, like Major Alexander P. Seversky (*Victory Through Air Power*) and William B. Ziff (*The Coming Battle of Germany*), contended that the expensive battleship and aeroplane carrier should be relegated to second place, while major effort should be the production of hundreds of thousands of long range planes to give an overwhelming superiority in the air, where, they said, the war is to be won. The naval authorities, on the other hand, insisted that the day of the battleship and the carrier is not yet past.

U.S. and the Fighting.—America shared with her chief partners in the United Nations, Great Britain, Russia and China, the disastrous fortunes of the first half of 1942. In the four months after Pearl Harbor the Japanese conquered 1,000,000 sq.mi. in southeastern Asia and the Pacific islands, with a population of 100,000,000 and practically the whole world supply of rubber, tin, hemp, quinine, and rich sources of foodstuffs, oil and minerals. They drove the U.S. out of the Philippines, taking over 30,000 American and Filipino prisoners. The U.S. commanding general, Douglas MacArthur, was ordered to Australia, last bastion of the Allies in the southern Pacific. A daring air raid on Tokyo and Yokohama by Colonel "Jimmy" Doolittle on April 18 and the brave but futile resistance of the greatly outnumbered American troops on the Bataan peninsula and Corregidor in the Philippines, were the only heartening events in this dismal period. However, early in May the U.S. fleet inflicted a severe defeat on the Japanese in the four-day battle of the Coral sea off the northeast coast of Australia, and a month later, in the battle of Midway, prevented them from seizing Hawaii. On August 7 the marines took the offensive by landing on the island of Guadalcanal in the Solomons, and for the rest of the year the Americans made slow gains there and in New Guinea, while the fleet and air force inflicted a series of defeats on the Japanese in battles in the Solomons area. By the end of the year the tide of war in the Pacific had turned. The badly battered Japanese naval force was unable to protect the transports swarming with troops for landing in New Guinea and the Solomons. The Allies were keeping their lines of communication open. The prospect of regaining the areas seized by the Japanese in their amazing surge of victories in the early months of the year was brightening.

While the Pacific area was the main theatre of war for the Americans during most of the year, U.S. troops, ships and planes were engaged in many other parts of the world: battling against the submarine menace on U.S. coasts, attempting to dislodge the Japanese from their foothold in the Aleutian islands, joining the RAF in a Fourth of July raid on industrial centres in Germany, fighting with the Chinese to save the supply route to Chungking and with the British to halt General Rommel's drive to the Nile

WORKERS IN A U.S. AIRCRAFT FACTORY listening to a "pep talk" by an army officer during their lunch hour. Army and navy officers gave a number of such talks in U.S. war plants in 1942 to speed up production and the Suez canal. But the greatest of the U.S. achievements came in November. On June 18 Prime Minister Churchill arrived in Washington for conferences with President Roosevelt, following a visit a few weeks earlier of the soviet foreign minister, Molotov. The conversations were secret, but it was later believed that the president and Mr. Churchill were discussing a joint British and American expedition to the west coast of Africa, to open there the "second front" for which the hard-pressed Russians had been asking. The plans were carefully and secretly developed through the summer and autumn, and on Nov. 8 the greatest armada in all history, consisting of 500 transports and 350 warships landed on the Atlantic coast of Morocco. In 76 hours this huge expeditionary force under the command of General D. D. Eisenhower had gained possession of all French North Africa up to the border of Tunisia. Admiral Darlan, the high commissioner under the nominal authority of the Vichy government, went over to the Allies, ordering the French forces not to resist and thereby making U.S. occupation of Morocco and Algeria an easy task. The brilliant African exploit was hailed by President Roosevelt as the turning point of the war, coupled as it was with the relentless pursuit of Rommel's African corps westward across Libya by General B. L. Montgomery's British 8th army. Of all the 2,200 miles of North African coast in the hands of the axis a few months before, only Tunisia (for which the armies were desperately fighting as the year ended) was left to them. (*See* also WORLD WAR II.)

Foreign Relations.—Relations with Latin-America during 1942 were cordial. On Jan. 28 all the American republics except Argentina and Chile signed the anti-axis agreement which came out of the Pan-American conference at Rio de Janeiro, Brazil. Nine of the republics had already declared war on Japan, and on Aug. 22, Brazil, after losing 20 vessels by torpedo attacks, declared war on the axis. Mexico opened her ports and airports to American ships and planes, and to show her solidarity with the United States settled for $24,000,000 the claims of the American oil companies for property which had been expropriated in 1938. On May 19 the CBS opened a Latin-American network of 76 stations to bind the republics closer together and to the United States, and work was pushed on the Inter-American highway. Soon after the war opened some 500 Latin-Americans were in training for aviators in the United States. The war put an end to the precarious diplomatic relations of 1941 with Germany, Italy and Japan, and solidarity with the allied United Nations was so complete that no questions arose except as to the best methods of prosecuting the war to a successful close. The only serious problem was the relations of the United States with the Vichy government in France. Though it was realized that Vichy was only a puppet state under the control of Hitler, the U.S. government still, to the annoyance of General De Gaulle's Fighting French and of many of the American people, kept up the fiction that it was an independent state and maintained diplomatic relations with it. The reasons for this were partly in order that the American ambassador at Vichy, Admiral Leahy, might have a listening post near the heart of the political intrigues of the continent of Europe, and partly that he might be able to stiffen the resistance of Marshal Pétain to the increasing demands of the nazis. However, when the hold of Vichy on the French colonies was broken by Admiral Darlan's desertion to the Allies and the loss of North Africa, Hitler threw off the mask and ordered his soldiers to take possession of unoccupied France (Nov. 11). Ambassador Leahy returned to the United States to become a special adviser to President Roosevelt. Hitler's troops entered Toulon, where the major part of the French fleet (more than 60 warships) had long been lying at anchor, only to find that the French commander, Admiral de la Borde, had scuttled the ships to prevent them from falling into the nazis' hands (Nov. 27). Admiral Darlan, turncoat though he was, was accepted by President Roosevelt and General Eisenhower as the French representative in North Africa, as a "temporary expedient," the president making it clear that the United States would not interfere with the policy of French Africa after the war was over. COME AND NATIONAL PRODUCT; STOCKS AND BONDS; TAXATION; WEALTH AND INCOME, U.S. DISTRIBUTION OF.

Foreign Trade.—The U.S. department of commerce announced in Jan. 1942 that it would cease publication of its monthly summaries of U.S. foreign commerce, as of Oct. 31, 1941, in order to prevent giving vital information to the enemy. For such information as was available in 1942, *see* BUSINESS REVIEW; INTERNATIONAL TRADE; LEND-LEASE ADMINISTRATION, OFFICE OF.

Communication and Transportation.—For statistics, *see* the articles AVIATION, CIVIL; CANALS AND INLAND WATERWAYS; ELECTRIC TRANSPORTATION; MOTOR TRANSPORTATION; POST OFFICE; RADIO; RAILROADS; SHIPBUILDING; SHIPPING; MERCHANT MARINE; TELEPHONE.

Agriculture.—All major U.S. crops had banner harvests in 1942. The remarkable production was due not so much to increased acreage as it was to favourable weather. In no part of the country were there any serious crop failures. Even cotton and tobacco, which had declined in previous years, registered marked increases over the production of 1941. Soybeans continued to show the greatest relative increase, from 79,837,000 bu. in 1940 to 106,712,000 bu. in 1941 and an indicated 200,701,000 bu. in 1942. The average harvest of this crop during the 10-year period 1930–39 was only 35,506,000 bu. Table II shows the production of selected crops from 1932 through 1942, and Table III lists the average prices received by farmers for important crops on selected dates.

Shipments of cattle at public stockyards in the first eight months of 1942 were 4,176,000, as compared with 3,395,000 in the first eight months of 1941; calves 1,453,000 (1,329,000 in 1941); hogs 5,444,000 (5,161,000 in 1941); sheep and lambs 7,097,000 (6,273,000 in 1941).

(*See* also AGRICULTURE; LIVESTOCK; and the articles on separate crops and agricultural products.)

Manufacturing.—The report of the department of commerce biennial census of manufactures for 1939, issued Jan. 15, 1941, estimated the number of establishments at 184,244; salaries and wages at $11,631,967,995 and value of products at $56,828,807,223. The comparable figures for 1937 were: 166,794; $12,829,748,927; $60,712,871,737. The leading industrial groups were as follows: food, iron and steel, motor cars, textiles, chemicals, apparel, and machinery except electrical. (*See* also WAR PRODUCTION, U.S.)

Labour.—For data on labour in 1942, *see* the articles AMERICAN FEDERATION OF LABOR; CONGRESS OF INDUSTRIAL ORGANIZATIONS; LABOUR UNIONS; RELIEF; SOCIAL SECURITY; STRIKES AND

Table I.—*Total U.S. Imports and Exports of Merchandise, 1932–41*

SEVERAL THOUSAND U.S. TROOPS, first contingent of the A.E.F. of World War II, arrived in Northern Ireland Jan. 26, 1942

Lock-outs; Unemployment; Wages and Hours.

Mineral Production.—The U.S. department of the interior, for reasons of military security, issued no statistics on U.S. mineral production in 1942. Such figures, had they been made public, would have been for the year 1941. Statistical information released in 1941 pertained to the calendar year 1940. According to the bureau's estimate, the total value of U.S. mineral production in the latter year was $5,582,500,000, an increase of $668,200,000 over the production of 1939. In only five other years—1920, 1923, 1925, 1926 and 1929—had the production of 1940 been exceeded in value. The record year was 1920: $6,981,340,000. (*See* also articles on individual minerals; also Mineral and Metal Prices and Production; Strategic Mineral Supplies.)

Table IV.—*Principal Mineral Products of the U.S., 1940 and 1939*

Mineral	Value, 1940	Value, 1939
Petroleum	$1,352,000,000	$1,294,470,000
Bituminous coal	861,166,000	728,234,000
Pig iron	840,442,032	626,824,690
Natural gas	591,509,000	534,240,000
Coke	273,832,410	212,884,050
Gold	210,108,700	196,391,000
Pennsylvania anthracite	205,490,000	187,175,000
Copper	205,453,000	148,236,000
Cement	193,464,869	184,254,932
Iron ore	189,086,799	158,537,696
Stone	160,044,115	158,461,515

U.S. Investments Abroad.

Foreign investments of individuals and corporations domiciled in the United States had an estimated value of $11,000,000,000 at the end of 1940 and, except for war losses, probably did not change substantially in value after that date. These investments are usually grouped in three categories: direct, portfolio and short-term. Direct investments, valued at $7,000,000,000 or about 60% of the total, included all foreign business enterprises controlled by United States residents or in the management of which such residents had an important voice. Portfolio investments, valued at about $3,600,000,000 at the end of 1940, included foreign dollar bonds and miscellaneous holdings of various foreign securities. United States short-term assets abroad, which had been declining in importance, were placed at $410,000,000 on Dec. 31, 1940. There was probably a further decline after that date, since the need for maintaining working balances in foreign countries diminished considerably under wartime conditions.

Canada ranked first among the countries of the world as a foreign outlet for United States capital; indeed, investments in that country were larger by far than those in either Europe or South America. Besides being larger in amount, investments in Canada were, on the whole, among the most consistently remunerative of U.S. investments abroad, partly because of the extremely low default ratio on Canadian bonds held in the United States. Direct investments in the dominion were well diversified, with manufacturing, public utilities (including railroads), and paper and pulp the major industrial groups involved. It was estimated that income of about $190,000,000 was received by Americans from Canadian investments in 1940 and only a slightly smaller amount in 1941.

The year 1942 witnessed a rather extraordinary increase of U.S. portfolio investments in Canada. From January to September, according to official Canadian sources, residents of the United States were net purchasers of Canadian bonds in the amount of $70,300,000.

At the end of 1940, long-term investments in Latin America exceeded those in Canada by about $100,000,000, with direct investments comprising 73% of the total as compared with 56% in Canada. As a result of this high proportion of direct holdings, which included highly profitable mining and petroleum enterprises, the return on long-term investments in Latin-American countries compared favourably with that on investments in other areas despite numerous defaults on dollar bond obligations. Total income from investments in this area amounted to $180,000,000 in 1940 and probably increased somewhat in 1941 and 1942.

Direct investments also formed a large share of U.S. holdings in Europe, amounting to about 69% of the total in 1940. Over 60% of these direct investments were located in the United Kingdom and Germany, while U.S. holdings of the dollar obligations of the latter country were also substantial. At the end of 1940, 59% of the European dollar bonds held in the United States were in default, and remittances of income of all kinds from several European countries were effectively prohibited for several years. In spite of this, it was estimated that income of $90,000,000 was received from investments in Europe in 1940 for an over-all rate of return of 4.4% as compared with 5.0% for Canada and 4.8% for Latin America.

United States direct investments in Africa, Asia and Oceania of $706,000,000 greatly outweighed portfolio investments of $277,000,000. Japanese and Australian issues accounted for about $200,000,000 of the latter. Many direct investments in these areas were also very profitable, as indicated by an estimated total income of $95,000,000 in 1940.

United States Investments Abroad, December 31, 1940

Sources: *American Direct Investments in Foreign Countries*, U.S. Department of Commerce, 1942; *The Balance of International Payments of the United States in 1940*, U.S. Department of Commerce, 1941; "Status of United States Investments in Foreign Dollar Bonds, End of 1940," in *Foreign Commerce Weekly*, July 19, 1941, p. 3; "U.S. Investments in Foreign Dollar Bonds," in *Foreign Commerce Weekly*, Sept. 26, 1942, p. 8; *Bulletin* of the Treasury Department, March 1941.

The war, of course, greatly altered the status of U.S. investments abroad, and the outlook for the future was in many respects unpredictable. Income ceased from direct investments in enemy-controlled areas, but certain occupied countries in Europe were still making payments on their dollar obligations out of funds frozen in the United States. Aerial warfare and scorched-earth policies caused the physical destruction of some U.S.-owned properties in foreign countries and the final value of much of the investment depended on the future course of the war and the condition of peace. In the meantime, a special provision of the Revenue act of 1942 permitted Americans to consider worthless their holdings in enemy territory and to deduct the value thereof for income tax purposes.

It should be emphasized that only $1,000,000,000 of a total of $7,000,000,000 of U.S. direct investments was, at the end of 1942, located in territory under enemy control and that approximately 70% of the total was located in the western hemisphere. Although high taxes in Canada and the curtailment of gold mining there would probably serve to reduce income from investments in that country for the duration, U.S.-owned factories, in company with all Canadian industry, underwent a wartime expansion. To the south, the war resulted, on the whole, in a larger measure of prosperity to U.S.-controlled industry. Cuban sugar companies, for instance, reported for their 1942 fiscal years the largest profits in late years, and the abundant supply of dollars available to most Latin-American countries was facilitating the remittance of profits to the United States. It was possible also that measures would be taken to resume debt service on defaulted Latin-American obligations; the action of the government of Mexico in making an offer for settlement of certain long-defaulted bonds was a step in this direction. The increasing industrialization of Latin America and the close economic co-operation engendered by the war opened the prospect of broader opportunities for U.S. trade and capital in the region.

The problem of international investment presented itself as one of the most difficult of the postwar world. The determination of the status of foreign holdings in enemy and enemy-occupied countries was expected to be an immediate postwar issue. The urgent necessity of facilitating the transfer of capital from countries where it is relatively plentiful to those where it will be sorely needed must be faced in the light of the mistakes and excesses of past foreign lending. Indications were that the United States would play a key role in the restoration of international lending after the war and that its policy with respect to foreign investments would have a great influence in shaping the general character of postwar international economic relations. (R. L. Ss.)

Universities and Colleges.

The following seven pages carry a selected list of universities, colleges and junior colleges in the U.S. and Canada, with location, year founded, chief executive, enrolment, size of faculty, endowment and number of library volumes, for the academic year 1942–43. An asterisk denotes 1941–42 data; two asterisks denote 1940–41 data. (*See* also EDUCATION.)

Uranium.

Before the surrender of Belgium much of the accumulated stocks at the radium-uranium refinery at Oolen were transferred to the United States, resulting in an increase in the receipts of uranium compounds from 376,708 lb. in 1939 to 1,439,324 lb. in 1940. With the refinery no longer available, mine operation was stopped, and some 1,200 tons of uranium ore were shipped to the United States in 1940, and subsequent receipts of uranium compounds, amounting to 240,200 lb. in 1940 and 229,872 lb. in the first nine months of 1941, came mainly from Canada. (*See* also RADIUM.) (G. A. RO.)

Urology.

An adequate presentation of recent advances in urology makes necessary the inclusion of material on treatment of urologic diseases. However, it should be understood distinctly that some of the drugs mentioned are dangerous if prescribed or used by a person untrained in their use and that none of the treatments referred to hereinafter should be employed except under the direction of a physician.

Sulphathiazole has been found to be the drug of choice in the treatment of infections of the urinary tract. The dose given previously for urinary infection was much larger than necessary. Experience showed that sulphathiazole in a certain daily dose usually is sufficient to control uncomplicated urinary infections. Sulphathiazole in a smaller daily dose was found to be effective as a prophylactic preoperative agent. The failure of sulphonamide medication in combating postoperative urinary infection, which often follows transurethral operations, was not explained until recently. It was shown that the presence of exudates such as peptones and para-aminobenzoic acid released by the cut tissues in the prostatic bed inhibits the action of the sulphonamide compounds.

That renal irritation may follow the administration of sulphonamide drugs such as sulphadiazine was emphasized during 1942. Many cases were reported in which acetylization of the drug occurred with deposit of crystals in the renal tubules to such an extent that the secretion of urine was suppressed and uraemia resulted. Although this usually followed the administration of large amounts and long continued use of the drug, occasionally it has occurred with limited doses. In most of these cases if the condition was recognized soon enough, ureteral catheterization with lavage of the renal pelves, forced administration of fluids and cessation of administration of the drug restored renal function to normal. However, several cases of uraemia following administration of sulphadiazine also were reported in which widespread damage to renal tubules without urinary crystallization was reported. These complications apparently occurred more often with sulphadiazine than with sulphathiazole.

Failure of sulphonamide compounds to cure gonococcal infections in many cases caused some concern in the medical corps of the armed forces. It was found that inadequate administration of a sulphonamide compound is the most frequent cause. The drug often was used during only four or five days instead of the necessary 10 to 14 days. When the drug was readministered two or three weeks later the patient apparently formed a resistance to the drug so that its efficacy was negated. In the few cases in which the proper administration of sulphathiazole did not produce cure, subsequent hyperthermia was most efficient.

There was considerable discussion as to the best method of neutralizing androgenic secretion in the palliative treatment of carcinoma of the prostate gland and coincident metastasis. It was admitted generally that orchiectomy is more efficient than the use of testicular radiation. However, some observers maintained that equally good results can be achieved by the administration of stilboestrol. It was claimed that when given in a certain daily dose stilboestrol will cause regression of the prostatic carcinoma and of metastasis, and improvement of the patient's general condition will be equal in degree to that observed following orchiectomy. Some clinicians employed both orchiectomy and internal administration of stilboestrol. Intolerance to large doses of estrogenic drugs was observed but it usually was overcome by initial small doses. Comparing the results obtained from orchiectomy and from oestrogenic therapy as reported during 1942 it would seem that orchiectomy is the more efficient method of controlling androgenic secretion.

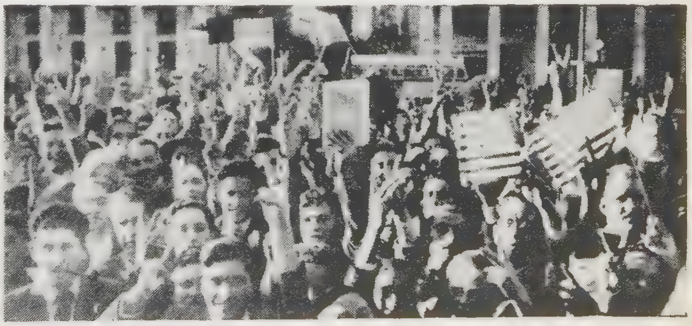
Frequent attempts were made to dissolve urinary calculi by means of continuous application of various chemical agents. Most of such chemical solutions were highly acid and they caused so much irritation in the adjacent tissues that their use was impractical. It was shown that solutions of citric acid were most effective in dissolving formations of calcium in vitro. It was found that solutions of sodium citrate can be buffered successfully with magnesium without diminishing their power of dissolving calcium elements. Certain types of phosphatic stones of loose consistency became amenable to such treatment.

During 1942 various complications resulting from nearby explosions or blasts received much attention. The symptoms accompanying this form of war injury were referred to as "crush syndrome." Suppression of urine was a frequent complication, without any gross evidence of actual renal trauma. (*See* also CHEMOTHERAPY.) (W. F. BR.)

Uruguay.

The smallest of the South American republics, on the Atlantic coast between Argentina and Brazil. Area, 72,153 sq.mi.; pop. (1939 official est.) 2,146,545. The percentage of whites is higher than in any American country except Argentina and Canada. Capital, Montevideo, pop. (1941 official est.) 770,000. President in 1942: General Alfredo Baldomir.

History.—Uruguayan developments throughout 1942 stemmed generally from World War II conditions. The almost constant political conflicts of the two main political groups in the country came, in the main, as a result of a difference of opinion over foreign policy. The obstructionist tactics of the opposition, which had led in 1941 to several cabinet and congressional crises, threatened to do the same in 1942, until in February, President Baldomir dissolved congress and postponed to November the presidential election scheduled for March. By certain peculiar provisions of the constitution the minority party (in this case, the Blanco Nationalist party, headed by Luis Alberto Herrera) was given a minimum of three of the nine cabinet posts and half the senate membership. No governmental actions were possible if the opposition refused to attend congressional meetings. To correct this situation, President Baldomir actively supported constitutional reforms. Herrera, strongly anti-United States and inclined to be pro-axis in his sympathies, steadily opposed the administration's foreign policy, the keystone of which was Pan-American co-operation. During the eight months between the dissolution of



PROTESTING THE SINKING of a Uruguayan ship, students staged a pro-United Nations rally at Montevideo in March 1942 congress and the November elections, President Baldomir ruled with the aid of a state commission, composed of a large number of prominent citizens, which he had selected to share with him the responsibilities of government.

In September, with the naming of Juan José Amézaga and Luis Alberto Herrera as the presidential candidates by the two main parties, the campaign got under way. Running as vice-president on the Baldomir-sponsored Amézaga ticket was Foreign Minister Alberto Guani. On November 29, the election was held and, with only 65% of the total electorate voting, in part because of tremendous nation-wide rainstorms, the administration's policies were approved. The government party (the Colorados) not only elected Amézaga and Guani but also captured both houses of congress and most departmental and municipal offices. In addition, the constitutional changes proposed by the chief executive were approved by decisive majorities.

After the Rio de Janeiro Conference of Foreign Ministers in January, Uruguay severed its diplomatic relations with Germany, Italy and Japan, and announced a policy of close co-operation with the other American nations against axis aggression. Active defense measures were also taken, especially after the receipt of an unspecified amount of weapons from the United States in the form of a lend-lease grant.

To offset its lost European markets and, in part, to prepare for eventual post-war conditions, Uruguay signed a reciprocal trade agreement with the United States in July. Growing fuel shortages in late 1942 promised, unless soon relieved, wide unemployment and distress.

Education.—Education is free and compulsory. There were about 1,700 primary schools (enrolment over 200,000) in 1941, and the national university at Montevideo.

Defense.—The army of some 8,000 men (as of 1941) was considerably strengthened and modernized with new weapons in 1942.

Finance.—The monetary unit is the peso (value: approx. 53.5 cents U.S. in 1942; 1940 average value: 37.55 cents U.S.).

Trade and Communication.—In 1940 exports were valued at 110,473,000 pesos (a 9.0% increase), and went chiefly to the United States, 25.8% (1939: 13.9%); Great Britain, 20.8% (18.5%); Netherlands, 6.5% (3.4%); Brazil, 5.5% (6.0%). They consisted largely of wool, 49.1% (1939: 36.2%); meats and extracts, 22.1% (21.5%); hides and skins, 9.1% (11.0%); linseed, 6.7% (7.3%); livestock, 4.6% (4.4%); cereals, 0.7% (6.6%). In 1940 imports (principally textiles, foodstuffs, fuel and miscellaneous manufactures) rose 14.4%, to 74,773,000 pesos, mainly from Great Britain, 18.5% (1939: 18.2%); United States, 16.3% (5.2%); Argentina, 13.5% (6.7%); and Brazil, 9.5% (8.3%). Decreases in exports, particularly in wool, were considerable in 1941 and 1942.

External communication is principally by water and by Pan American Airways, with supplementary rail and highway connections to Argentina and Brazil. There were more than 22,500 mi. of highways and 1,683 mi. of railway in 1941, with extension of both systems planned.

Agriculture and Manufacturing.—Uruguay is primarily pastoral (sheep and cattle), with nearly 80% of the country in grazing land. There is important acreage in wheat, flax, maize and oats. Processing and packing of meat products is an important industry. (*See* also ARGENTINA; HISPANIC AMERICA AND WORLD WAR II.) (C. N. G.)

U.S.O.: *see* UNITED SERVICE ORGANIZATIONS.

U.S.S.R.: *see* UNION OF SOVIET SOCIALIST REPUBLICS.

Utah. A Rocky Mountain state, admitted to the union in 1896, popularly known as the "Mormon state." Area 84,916 sq.mi.; pop. (1940) 550,310. The rural (nonfarm) population was 150,465, (farm) 94,352; urban 305,493, with the following origins: white (native) 510,662, (foreign born) 32,298; Negro (native) 1,225, (foreign born) 10. Capital, Salt Lake City (149,934). Other principal cities are Ogden (43,688), Provo (18,071) and Logan (11,868).

History.—In 1942 the administration of the Democratic governor, Herbert B. Maw, co-operated with federal authorities in essential war measures and continued to perfect the governmental reorganization plan adopted by the 24th legislature in 1941. Japanese resettlement centres were established at Topaz and Abraham.

In 1942 E. E. Monson continued as secretary of state, Reese M. Reese, auditor, Oliver G. Ellis, treasurer; Grover A. Giles, attorney-general and Charles H. Skidmore, superintendent of public instruction.

Education.—There were 148,632 children in the public schools in 1942, highest enrolment since 1933, when there were 149,068. The total cost of education was $12,292,390.60, with $10,223,136 devoted to operating expenses. There were 4,110 teachers and 445 principals.

Public Welfare, Charities, Correction.—Total state obligations of $8,082,000 incurred in 1942 for public assistance were distributed as follows: old-age assistance, $4,714,000, aid to dependent children, $2,035,000; aid to blind, $57,000; general $1,276,000. A total of 18,411 households were receiving state assistance in June, 1942 as compared with 21,508 in Dec. 1941.

Communication.—Highway mileage in 1942 was as follows: state, 5,106; county, 14,584; city, 2,269. There were 2,157 mi. of steam railway in 1938. Utah had more than 30 airports and fields in 1942.

Banking and Finance.—Sixty banks, 47 state and 13 national, had total assets of $233,279,000 in 1942 and 15 building and loan associations had aggregate assets of $20,926,166.17. Total bank deposits reached $212,112,000. State receipts for the year ending June 30, 1942 were $40,400,517.83; expenditures were $37,383,310.21. The total of outstanding bonds in 1942 was $1,695,000, with this amount available from the state liquor control fund for retirement of all outstanding bonds.

Agriculture.—Cash income from farm marketings was $73,815,000 during Jan.–Nov. 1942 as compared with $56,092,000 for the same period in 1941 and $41,339,000 for the same period 1940. Producers increased the farm yield as part of the war program. Value of 1942 truck and canning crops was $4,036,000; for 1941, $2,746,000. Value of canning tomatoes in 1942 was $1,356,000, and shipping tomatoes, $756,000.

Principal Agricultural Products of Utah, 1942 and 1941

Crop	1942	1941
Hay (tame and wild), tons	1,174,000	1,216,000
Potatoes, bu.	2,312,000	1,904,000
Sugar beets, short tons	570,000	575,000
Celery, crates	132,000	116,000
Tomatoes, fresh, bu.	35,000	35,000
" processing, tons	82,700	68,700
Onions, 100-lb. sacks	264,000	250,000
Peas, tons	20,080	19,170

Manufacturing.—The upward trend in manufacturing continued in 1942, with new industries enabling Utah not only to hold its population but to attract newcomers to defense industries. Workers numbered 30,700 in 1942 as compared with 20,300 in 1941, and only 15,982 in the first quarter of the latter year. Total pay rolls in manufacturing were $50,939,000 in 1942 as compared with $27,543,000 in 1941 and $23,400,000 in 1940.

Mineral Production.—The United States war program gave sharp impetus to the state's greatest industry, with important production of copper, lead, and zinc and activity in vanadium, tungsten and potash. Figures covering production of strategic minerals in Utah could not be published for reasons of national security. Production of gold in 1942 was 386,000 fine ounces and of silver 10,450,035 fine ounces. The year saw expansion of the pig iron plant and coking coal mine near Cedar City.

(F. W. GA.)

Utilities, Public: *see* PUBLIC UTILITIES.

Vanadium.

Peru is the leading producer of vanadium, with nearly half of the world total. Exports of ore declined from 19,784 metric tons in 1940 to 11,682 tons in 1941, containing 1,027.6 tons of vanadium. The output of South-West Africa in the first half of 1941 was somewhat ahead of the 1940 average, but below that of previous years. The small Mexican output practically ceased in 1941, and no data were received from Northern Rhodesia or the United States. (G. A. RO.)

Vandegrift, Alexander A.

(1887–), U.S. marine corps officer, was born March 13 in Virginia. He served under Gen. Smedley Butler at Nicaragua and Haiti and was stationed at Shanghai and Tientsin in the late 1920s. He was promoted to brigadier general in 1940 and a year later became assistant commandant of the marine corps. He was made a major general in 1942 and in May of that year, embarked for a secret destination in the Southwest Pacific. Three months later, on Aug. 7, he led the U.S. marine forces that landed on the Solomon Islands. Vandegrift's forces successfully stormed Japanese positions on Guadalcanal and seized the nearby air base (Henderson field). They successfully repulsed a Japanese attempt to break through his lines on the southeastern end of the island that month and again fought off a Japanese drive to recapture Henderson field on Sept. 13–14. In a press conference on Dec. 7, General Vandegrift estimated that 7,000 Japanese troops had been killed since the initial landings of the marines while Americans slain numbered only 700.

Vanderbilt, Cornelius, III

(1873–1942), U.S. capitalist, born Sept. 5 in New York city, was the great-grandson of Commodore Vanderbilt, founder of one of America's railroad empires. Educated by private tutors and at Yale, Vanderbilt took an early interest in mechanical engineering. Frequently, he visited railway drafting rooms and shops where he studied railroad problems. He patented more than 30 devices for improving locomotives and freight cars. A colonel of the 102nd engineers serving overseas during World War I, he won promotion to brigadier general in 1918 and maintained his rank in the organized reserves until 1935. He died aboard his yacht, the "Ambassadress," anchored off Miami, Fla., March 1.

Varnishes: *see* PAINTS AND VARNISHES.

Vassar College.

A college for women at Poughkeepsie, N.Y., founded in 1861. To meet the need for women trained for immediate usefulness in the war effort, the college added to its curriculum translator's courses preparing for civil service examinations in French, German, modern Greek, Russian and Spanish; a course in astronomy to meet the civil service requirement for junior meteorologists; advanced courses in personnel and consulting psychology; additional work in physics on radio and vacuum tube applications; a political science course in principles of public administration; special work in mathematics and a pre-engineering course with either mathematics or physics as major field. The content of many other courses, especially in the natural and social sciences, was adapted to wartime demands. Students whose academic program was not directed toward war service were expected to participate in community activities or to enroll in extra-curricular courses organized by the Vassar Co-ordinating Council for War Activities as training for employment in government and business offices, or for work in social welfare, recreational and child care centres, hospitals, canteens and protective services. Such established projects as work in settlement houses or in the techniques of communication through radio programs, forums and graphic exhibits were recognized as preparation for war service.

During the summer a six-week Institute for Family and Child Care Services in War Time was conducted on the campus for social workers, educators and others. For statistics of the faculty, student enrolment, endowment, etc., *see* UNIVERSITIES AND COLLEGES. (H. N. MACC.)

Vatican City State.

A sovereign independent state, established by the Lateran treaty between the Holy See and the royal Italian government, Feb. 11, 1929. The treaty is recognized in international law, and the reigning pope is the sovereign. The area of Vatican City is 108.7 ac. It has its own railroad station, radio station, postal system and currency. Total issue of bronze, nickel and silver coins in any one year is not to exceed 1,000,000 lire. Executive powers are exercised by the governor, responsible exclusively to the pope; administrative power is exercised by a commission of cardinals, of which Cardinal Canali was president in 1942.

The population of Vatican City in 1942 numbered about 800, to which was added the Vatican diplomatic colony representing those countries who broke off relations with Italy. Seventeen families, numbering 162 persons, were removed from Rome to quarters in Vatican City in 1942.

Forty states were represented at the Holy See—15 embassies, 24 envoys of ministerial rank and one chargé d'affaires. During 1942 Finland, Japan and China entered into diplomatic relations with the Holy See, and there was a movement in Mexico to establish relations.

The Holy See made it clear that it did not recognize territorial changes brought about by invasion. Reports that the Vatican had established diplomatic relations with the puppet State of Croatia were denied by Radio Vatican Oct. 13. The nazi government obliged the Holy See to recall some of its diplomatic representatives from occupied countries.

The Vatican published a *Yellow Book* on the work of the Prisoners of War Information bureau under the secretariate of state. The bureau was enlarged from a personnel of two to more than 130, and headquarters set up in the offices of the Congregation for the Oriental Church. The work of the bureau was extended to Britain, Australia, Africa and other countries. Daily broadcasts of the names of prisoners of war were made by Radio Vatican in various languages.

Italy's new ambassador to the Vatican presented his credentials Feb. 27, 1942. Myron C. Taylor, personal representative of President Roosevelt, was received in farewell audience by Pius XII Sept. 26.

The Holy See maintained its policy of neutrality in 1942, but the pope continued to denounce political totalitarianism, and supplied funds for food and clothing to the occupied countries. Enjoying freedom of communication with all nations, the pope by broadcasts and letters championed the cause of democracy. (*See* also PIUS XII.) (J. LAF.)

Vegetable Oils and Animal Fats.

The urgent U.S. need for increased production of fats and oils for lend-lease and military export and for increased home consumption resulted in an output of 11,700,-

000,000 lb. of fats and oils from domestic materials in the United States in the crop year of 1942, as estimated by the department of agriculture. Production in the preceding crop year was 9,600,000,000 lb. United States production of vegetable oils from domestic materials in the crop year of 1942 was 4,200,000,000 lb.

A striking example of how the loss of U.S. imports of oils from the far east, particularly coco-nut and palm oils, affected the United States in 1942 was shown in the production of oleomargarine. In Oct. 1941 4,680,000 lb. of coco-nut oil and 1,125,000 lb. of palm oil were used in the manufacture of 34,060,000 lb. of oleomargarine. In Oct. 1942, not one pound of these imported oils was used, although oleomargarine production was increased that month to 46,283,000 lb.

An extensive experiment in the production of sunflower seed oil was begun in Canada in 1942 for the purpose of relieving the shortage in fats caused by wartime cessation of Pacific imports of oil. Information received by the U.S. department of agriculture indicated that about 3,000 ac. were planted to sunflowers in 1942, that production approximated 800 lb. per ac. and that there was hope for a substantial oil crop in 1943. Earlier in 1942 the Canadian government bought 30,000 lb. of "Giant Russian" seed for crushing experiments to determine techniques of oil extraction suited to Canada. Argentina greatly increased its production and exports of oil seeds in 1942, particularly sunflower seed.

U.S. Production of Principal Fats and Oils
(Department of Agriculture Estimates)

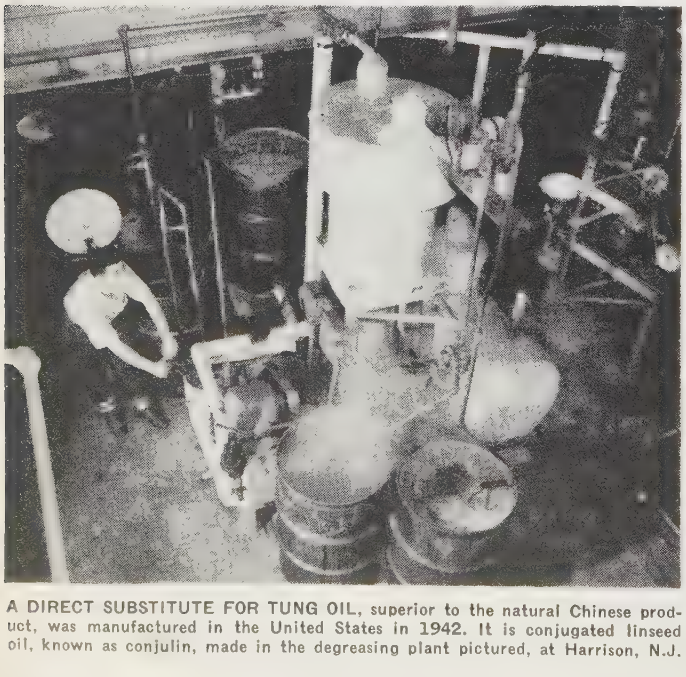
	Year Beginning	1940–41 lb.	1941–42 lb.	1942–43* lb.
Butter, creamery & farm	July	2,280,000,000	2,180,000,000	2,150,000,000
Lard, and rendered pork fat	Oct.	2,275,000,000	2,480,000,000	2,900,000,000
Inedible tallow and greases	Oct.	1,492,000,000	1,732,000,000	1,950,000,000
Corn oil	Oct.	185,000,000	242,000,000	250,000,000
Cottonseed oil	Aug.	1,425,000,000	1,250,000,000	1,445,000,000
Linseed oil**	July	707,000,000	988,000,000	010,000,000
Olive oil	Oct.	11,000,000	8,000,000	11,000,000
Peanut oil	Oct.	174,000,000	76,000,000	300,000,000
Soybean oil	Oct.	564,000,000	707,000,000	1,440.000.000
Tung oil	Dec.	5,000,000	3,000,000	8,000,000

*Estimated. **Includes production from imported flaxseed.

In the first seven months of 1942 the Argentine exported 148,451,000 lb. of oils, 60% of which was sunflower seed oil. Argentine exports for the entire year of 1941 were only 105,521,000 lb.

U.S. supplies of fats and oils for 1943, including anticipated production, imports and stocks on hand Jan. 1, 1943, were estimated at 14,500,000,000 lb. In addition to export requirements it was estimated that civilian use would require 9,200,000,000 lb., the maximum permitted under the limitation order on manufacturers. No restrictions, however, were placed on the manufacture of butter and lard. Prices of most food and soap fats and oils were maintained at ceiling levels in the closing months of 1942. Prices of flaxseed and linseed oil declined in Nov. 1942, reflecting a reduced demand for paint oils and large supplies of flaxseed. Conservation orders Nov. 20, 1942, required that about 40% of cold storage stocks of butter be set aside for the requirements of governmental agencies. Restrictions were also placed on the sale of cream, to encourage butter production. Purchases of fats and oils by the Agricultural Marketing administration averaged 80,000,000 lb. per month the first ten months of 1942. (*See* also BUTTER; COCO-NUTS; COTTON; PEANUTS; SOYBEANS.)

(S. O. R.)



A DIRECT SUBSTITUTE FOR TUNG OIL, superior to the natural Chinese product, was manufactured in the United States in 1942. It is conjugated linseed oil, known as conjulin, made in the degreasing plant pictured, at Harrison, N.J.

Venereal Diseases.

America's entry into World War II accelerated venereal disease control activities among the armed forces, on the war production front and among civilians. In Feb. 1942, deficiency funds totalling $2,500,000 were appropriated for venereal disease control by congress, bringing the total of federal appropriations during the fiscal year to $8,750,000. State, local and other funds brought into the program raised the total from all sources to $17,700,000.

Chief objectives of control activities were: (a) to pursue an intensified control program among the general population with special emphasis on cantonment and war production areas; (b) to find, treat and restore to fitness for military or other wartime service selectees found to be infected with venereal disease; (c) to set up special venereal disease control measures for the protection of employers and employees in industry.

Of especial significance in the planning of control programs throughout the country were the prevalence rates among the first 2,000,000 selectees and volunteers examined for service in the armed forces. In accordance with provisions of the Selective Training and Service Act of 1940, all selectees and volunteers were given serologic blood tests for syphilis. By the end of Aug. 1941, reports on the first 2,000,000 were ready for tabulation and analysis. They represent the largest sampling ever taken of venereal infection in the United States, and form the basis for the most reliable estimates ever made of the prevalence of syphilis.

The selectee reports for the country as a whole show that 4.5% of the selectees and volunteers examined were infected. For the entire male population, aged 21 to 35, the estimated percentage is 4.8; for the total population—male and female, all ages—the percentage is 2.5; and the total syphilis population of the United States is estimated to be approximately 3,300,000.

Table I shows the rates and population totals for the United States, for 16 southern states and the District of Columbia, for 21 northern states, and for 11 western states. The rates are also available by individual states, with breakdowns for urban and rural areas and for race. Prevalence rates are much higher among Negroes than among whites. The estimated rate of prevalence among all Negro males, aged 21 to 35, is 27.2%; among all white males in the same age group, 2.35%.

State health departments (Table II) were steadily expanding their activities. In 1942, they distributed more drugs than ever before; they made more blood tests; they were operating more clinics; and they had more patients under treatment.

Special efforts were made to recruit and train personnel for assignments in cantonment and war industry areas. During the

1941	3,245	340,615	84,418	16.5	8.2	7.2
1942	3,569	343,312	104,421	20.6	8.7	13.8

*End of calendar year. †In millions. ‡Estimate.

calendar year, some 120 additional doctors were given reserve commissions to carry on venereal disease control activities. Seventy nurses were added to the regular staff, supplementing the efforts of the doctors, both by assuming routine clinic duties and by training lay personnel in contact-tracing and follow-up activities. Some 415 lay workers were employed, given special training, and were assigned to venereal disease problem areas.

Sulphathiazole has become generally accepted as the standard drug for the treatment of gonorrhoea, although reports on the use of sulphadiazine indicated that it acts more rapidly and with fewer toxic results. So successful has been the use of the sulphonamide drugs in the treatment of gonorrhoea that nearly nine-tenths of the gonorrhoea cases are rendered asymptomatic within a period of two weeks.

Reports on the rapid treatment of syphilis inspired considerable optimism. Rapid treatment techniques employed in 1942 ranged from one-day, chemo-fever therapy to a multiple-injection therapy lasting for six weeks or more. No one of the rapid treatment techniques had been, at the close of 1942, accepted as standard by the United States public health service or by the medical profession. All were experimental, and, although the results were encouraging, they were by no means conclusive. (R. A. V.)

Venezuela.

A federal republic in northern South America, bounded on the north by the Caribbean sea, on the east by the Atlantic ocean and British Guiana, on the south and west by Brazil and Colombia. Area, 352,051 sq. mi.; pop. (1941 census) 3,839,747, an 11.4% increase since 1936. This figure does not include Indians who, according to the 1936 census, numbered 103,492. Capital, Caracas (266,726). Other cities (with 1936 figures): Maracaibo (110,010); Valencia (49,214); Barquisimeto (36,429); Maracay (29,759); Ciudad Bolívar (25,134). President in 1942: General Isaías Medina Angarita (since May 9, 1941).

History.—For Venezuela, 1942 was a year of adjustments, both internal and external, to a world at war. Foreign policy was directed toward strengthening both economic and political relations with the other South American republics. Official visits were made by Foreign Minister Parra Perez to Brazil, Argentina, Chile, Peru, Ecuador, Colombia, Uruguay, and Panama, while enthusiastic receptions were given to three South American presidents who, during the course of the year, visited Venezuela—Peru's Manuel Prado, Colombia's Alfonso Lopez, and Ecuador's Arroyo del Rio. A commercial treaty (with Argentina) was signed in 1942, as well as seven *modus vivendi* agreements, while treaties with Great Britain yielded the small island of Patos in the Gulf of Paria and defined the boundary line in that gulf between Venezuela and the British island of Trinidad.

ONE OF THE RARE NONVIOLENT TRANSFERS of sovereign territory in the 20th century took place late in Sept. 1942 when Great Britain formally ceded the tiny island of Patos, in the gulf of Paria near Trinidad, to Venezuela after several years of amicable dispute. The photograph shows the ceremony at which the British flag was lowered

The war in which the U.S. had become involved led to Venezuela's closer co-operation with the North American republic. In January, at the conference of American foreign ministers at Rio de Janeiro, Venezuela was one of the strongest advocates of hemispheric solidarity against Germany, Japan, and Italy.

Domestic developments in 1942, Venezuela's second year under President Medina's administration, were characterized by determined efforts to lessen the country's dependence upon imported foodstuffs and manufactured goods. Among the most important work of Venezuela's congress in 1942 was the adoption of a new civil code and the passage of Venezuela's first income tax law. Also notable in 1942 was the increase and improvement of the government's emergency controls of prices, transportation and imports, initiated at the outbreak of World War II.

The year ended with two national expositions, one industrial and the other agricultural, and, on December 17, a great centennial observance of the transfer of the remains of Simón Bolívar, South American hero of the Wars of Independence, to his native city of Caracas.

Education.—There were in 1942 more than 5,000 elementary schools with some 272,000 students; also 69 secondary schools and 21 institutions of commercial and other specialized training with a combined enrolment of more than 7,000. Two national universities (at Caracas and Merida) enrolled a total of 3,000 students in 1942.

Finance.—The monetary unit is the bolívar (value in 1942: approx. 30 cents U.S.). Public revenues during the first quarter (July–September) of the fiscal year, 1942–43, were 68,340,000 bolívares and expenditures were 73,817,000 bolívares; the 1942–43 budget was 320,248,000 bolívares. Notes in circulation (Sept. 30, 1942) totalled 207,534,170 bolívares. The gold reserve (Aug. 1942) was 208,234,230 bolívares, an amount more than sufficient to cover notes in circulation. The commercial banks (Aug., 1942) had a total capital of 73,500,000 bolívares, reserves of 30,175,000 bolívares, and deposits of 249,249,000 bolívares.

Trade and Communication.—In 1941 exports totalled 1,061,565,000 bolívares (an 18.9% increase over 1940), of which petroleum and its derivatives amounted to 94.2% (1940: 94%). Non-petroleum exports, principally coffee (39.2%), gold (26.2%), cacao (9.9%), cattle (3.4%), and hides (3.0%), went chiefly to the United States, 76.8% (1940: 77.5%); Argentina, 5.4% (.02%); Trinidad, 3.8% (4.3%); Curaçao, 2.6% (1.9%); and Colombia, 2.2% (1.7%). Imports in 1941, mostly foodstuffs, machinery, textiles, and chemicals were valued at 287,736,000 bolívares (an 8.2% decline), mainly from the United States, 78.8% (1940: 73.9%); Great Britain, 6.0% (7.6%); Brazil, 3.4% (0.7%); Canada, 1.6% (1.9%); and Argentina, 1.6% (0.4%).

Foreign communication is by steamship service, by Pan American Airways, and Royal Dutch Airways. There is also an all-weather highway connection with Colombia, by means of a branch of the Inter American highway running from Caracas to the Colombian border at Cúcuta. Within Venezuela the principal population centers are connected by a domestic airline. Highways (about 3,600 mi. surfaced and improved) and railroads (less than 700 mi.) are mostly situated in the mountainous area of northern Venezuela. In 1942 there were 42,000 licensed motor vehicles.

There were 28 broadcasting stations in 1942, though only five possessed more than purely local significance. Radio receiving sets were estimated at 120,000. At the beginning of 1942 there were 8,351 miles of telegraph lines.

Mineral Production.—Third largest petroleum producer in the world (after the U.S. and U.S.S.R.), Venezuela produced 225,000,000 bbls. in 1941 (21.6% more than in 1940), the largest annual output yet achieved; 13.1% of the 1941 production was refined in Venezuela, most of the remainder being sent to Aruba, Curaçao, and the U.S. (H. B. L.)

Vermiculite. Sales of vermiculite in the United States in 1941 increased 5% over 1940, to 23,438 short tons, but the value of the output dropped 13%. Most of the output was from Montana and Wyoming, but North Carolina was making a bid for a share in the market. (G. A. Ro.)

Vermont. A north Atlantic state, first to be added to the original thirteen of the United States; popularly known as the "Green Mountain State"; area, 9,718 sq.mi., of which 440 sq.mi. are water. The population in 1940 was 359,231, including 235,992 rural, 123,239 urban. There were 327,079 native whites, 31,727 foreign-born, 384 Negro, 41 of other races. Montpelier is the capital, with a population of 8,006. The two largest cities are Burlington on Lake Champlain (27,686), and Rutland (17,082).

History.—The year 1942 was an off-year for the biennial sessions of the Vermont state legislature. The principal activities of the state centred around various phases of war work. A Council of Safety was set up, modelled on the original Council of colonial days, to head up all the civilian defense work of the state. Gov. William H. Wills became the honorary chairman and Albert A. Cree of Rutland, executive chairman. Vermont led the nation in the scrap metal drive and was among the leading states in the scrap rubber drive. Aside from Governor Wills, other chief officers of the state for the year were Mortimer R. Proctor, lieutenant governor; Rawson C. Myrick, secretary of state; Thomas H. Cave, state treasurer; Warren R. Austin and George D. Aiken served as U.S. senators, and Charles A. Plumley as congressman.

Education.—There were approximately 1,100 elementary schools in operation during 1942, or some 80 less than in the preceding year. The enrolment, dropping 1,500, reached 44,095 pupils. The number of teachers was about 1,900. In the 91 secondary schools of the state there were some 16,065 pupils enrolled, a decrease of 1,000 from the preceding year. Teachers in the secondary schools numbered 705.

Public Welfare, Charities, Correction.—The state department of public welfare carried an average of 708 cases for aid to dependent children for the fiscal year ending June 30, 1942, with an average of 1,898 eligible children under the age of 16, and expended $277,014.96 for assistance payments. This expenditure was made up of 50% federal funds and 25% each of state and local funds. In the blind assistance program, there was an average of 161 cases, with an expenditure of $42,988.50, equally divided between the state and social security board. During the fiscal year there was an average of 1,441 cases receiving general relief, with expenditures of local funds totalling $318,719.27. Excluded from this figure was all expense of hospitalization, medical care, administrative cost, expense of poor farms and almshouses and the cost of distributing surplus commodities. There are only two penal institutions within the state. As of July 1, 1942, there were 173 inmates in the state prison for men and 97 in the house of correction, making a total of 270 confined in the state prison at Windsor. There were 25 women at Riverside reformatory in Rutland. The total cost of operation at the state prison in Windsor was $165,000 and the total cost at the women's reformatory was roughly $28,000. The Weeks school for minors at Vergennes is not included, because it is classed as a school rather than a penal institution.

Communication.—The total number of miles included in the public highways of the state during 1942 was 14,204.5. Of this number, 1,780.3 mi. were listed as state highways; 2,744.0 mi. as state-aid highways; 9,680.2 mi. as town highways. The total estimated state expenditure for highway work in Vermont during 1942 was $4,083,000. The state railroad system included 969.2 mi. of road. There were 56,535 telephones in the state.

Banking and Finance.—In 1942 there were 41 state banks in Vermont, 40 national banks, and 11 savings and loan associations. In 1941 (the latest date for which figures were available in 1942), the total resources of the 41 state banks were $127,313,722.25, showing a decrease of $29,279,310.26 since 1934. This decrease in total resources was accounted for in the amount of 44% or $12,800,000 by a decrease in liabilities. The remaining $17,100,000 represented shrinkage in asset value as estimated in 1934. On the whole, however, the financial condition of the state banks showed commendable progress since the 1934 period. The deposits in state banks in 1941 amounted to $116,837,463.65, which was an increase of $4,229,605.41 over the preceding year, but a decrease of $14,702,828.75 since 1934.

The capital and liabilities of the co-operative savings and loan associations in the state totalled $2,634,936.65 in 1941, and in 1940 $3,939,049.73, denoting a decrease of $1,304,113.08.

The total receipts in the state treasury department as of June 30, 1942, the close of the fiscal year, were $17,453,933.62. The disbursements were $17,008,053.86. The total state debt as of the same date was $6,650,031.90, a decrease of $1,157,000 from the preceding year. The total improvement in the state's financial condition was $1,754,196.44.

Agriculture.—The total acreage of Vermont crops in 1941, the latest survey from which figures were available in 1942, was 1,048,150. The 1940 acreage was 1,061,930. Agricultural crops were valued in 1941 at $22,459,000 and in 1940 at $18,489,000. The cash income from all farm crops in 1941 was $7,764,000 as against $7,716,000 in 1940, and of livestock and livestock products $41,258,000 as against $34,317,000, making a total of $49,022,000 for 1941 and $42,033,000 for 1940. Government payments in 1941 equalled $1,414,000 and in 1940 they equalled $595,000, bringing the grand total of income to $50,436,000 in 1941 as against $42,628,000 in 1940.

The production of dairy products and poultry and eggs increased in 1942, and the 1942 maple season resulted in a considerably increased income over 1941. The apple crop was larger in 1942, but the potato acreage was down. The weather was favourable to large hay and grain crops.

Leading Agricultural Products of Vermont, 1942 and 1941

Crop	1942	1941	Crop	1942	1941
Corn, bu. . . .	2,760,000	2,622,000	Maple syrup, gal.	. .	759,000
Potatoes, bu. .	1,500,000	1,740,000	Apples, bu. . .	714,000	664,000
Oats, bu. . . .	1,715,000	1,504,000	Maple sugar, lb.	. .	190,000
Hay, tons . .	1,207,000	968,000	Barley, bu. . .	160,000	135,000

Manufacturing.—The principal manufactured products of Vermont are machine tools, woodworking, lumber and furniture, marble, granite, textiles, paper. Other important products include talc, asbestos, slate, scales and clothing. Some industries, such as slate and marble, were not operating as extensively in 1942 as in normal times. Industries manufacturing war goods expanded output, employees and pay rolls.

The number of manufacturing establishments in Vermont was about 800 in 1942. The total number of workers was about 110,000, of which approximately 50,000 were industrial workers. Total wages paid industrial employees were about $49,500,000. As nearly as could be determined from available figures, wages in the non-manufacturing group averaged about $12 weekly. The total value of products produced was estimated to run well over $175,000,000.

Mineral Production.—The latest survey of mineral products in the state as of 1942 was made in 1939–40. At that time the total value of such products was $12,283,886. Granite products were valued at $7,304,356; slate at $1,948,315; marble at $1,533,824. Other important products are asbestos, talc, limestone and clay products. In 1942 much was done toward opening up old copper deposits and it was expected that the industry would prove profitable. (L. W. D.)

Veterans Administration.

On June 30, 1942, the U. S. Veterans administration was operating hospital facilities at 92 locations in 45 states and the District of Columbia. There were 62,453 beds for hospital treatment and 18,371 for domiciliary care. In addition, 1,959 hospital beds in other government facilities were being utilized. The hospital load of the Veterans administration at that time was 56,346 patients, of whom 56,073 were United States veterans, 31 were Allied veterans, 18 were employees of the Civilian Conservation corps and Work Projects administration, and 224 were miscellaneous beneficiaries. Of the United States veterans, 52,999 were in Veterans administration facilities, 2,080 in other government hospitals and 994 in state or civil institutions. Approximately 76.82% of these United States veterans were receiving treatment for disabilities not of service origin. During the fiscal year 1942, 9,658 United States veterans were admitted for observation and treatment of tuberculosis, 10,200 for psychotic or mental diseases, 14,101 for other neurological disorders and 145,315 for general medical and surgical conditions. The veteran population in domiciliary status June 30, 1942, totalled 11,573. Of this number, 7,417 veterans were disabled by general medical and surgical conditions, 3,987 by neuropsychiatric diseases and 169 by tubercular ailments. During the fiscal year 1942, an average of 5,730 veterans eligible for care in Veterans administration facilities were cared for in state or territorial homes. These homes are reimbursed by the federal government at the rate of $240 a year for each of such veterans domiciled therein. During this year, dental care was provided for 32,505 hospital patients, 10,087 domiciliary members and 3,394 out-patients in clinics maintained by the veterans administration.

Pensions and Compensation.—Table I shows the number of cases on the rolls as of June 30, 1942, and the net disbursements during the fiscal year 1942 from the appropriations "Army and Navy Pensions."

Table I.—*U.S. Veterans on Roll, June 30, 1942*

War	On roll, June 30, 1942	Disbursements, fiscal year 1942
Yellow fever experiments		
Participants	9	$ 14,750.00

Grand total—pensions and compensation. . .	859,703	431,298,459.93
Living veterans	623,659	320,373,509.72
Deceased veterans	236,035	110,910,200.21
Participants, yellow fever experiments .	9	14,750.00

The guardianship load of the Veterans administration, June 30, 1942, was 81,114 wards, of whom 43,336 were incompetents and 37,778 minors. The value of estates of these wards approximated $159,935,514.67.

Insurance.—As of June 30, 1942, there were 594,735 United States government life insurance policies in force, representing $2,507,082,186 of insurance. Monthly payments were being made to 10,836 policyholders for permanent and total disabilities. Disbursements for this type of insurance during the fiscal year 1942 totalled $44,481,192.02. On June 30, 1942, monthly payments on yearly renewable term insurance policies were being made to 9,981 permanently and totally disabled veterans and to the beneficiaries of 6,402 deceased veterans. Monthly payments on automatic insurance policies were being made to 236 veterans and the beneficiaries of 30 deceased veterans. Disbursements for term and automatic insurance during the fiscal year totalled $15,490,931.27. During the period Oct. 8, 1940, to June 30, 1942, 1,481,758 applications for national service life insurance aggregating $6,810,239,500 were approved. An act approved Oct. 17, 1940, provided for suspension of enforcement of certain civil liabilities of persons serving in the armed forces of the United States. Article IV of the act provides that the government would, on application by the insured, guarantee to commercial insurance companies premiums on insurance carried with such companies by policyholders while in active service. Through June 30, 1942, 35,118 applications for this benefit had been received, of which 23,421, representing $56,501,816 of insurance, had been approved. Certificates issued to insurers guaranteeing premiums totalled 1,621 aggregating $1,016,995 of insurance.

Civilian Conservation Corps.—The total authorized quota for the veterans contingent of the corps at the beginning of the fiscal year 1942 was 24,400. The year was begun with an enrolment strength of 20,200 veterans. There were 11,342 veterans enrolled in the corps during the fiscal year. The remaining strength on June 30, 1942, was 11,147. The records indicate that as of June 30, 1942, there had been approximately 225,000 enrolments in the veterans contingent since its beginning. The total number of veterans and their dependents who had received direct monetary benefits through payments and allotments was slightly less than 600,000.

The Civilian Conservation corps ceased to exist as an operating agency on June 30, 1942, responsive to congressional legislation. The veterans remaining in the corps at that time were given assistance primarily through the medium of the United States employment service in obtaining employment elsewhere.

Table II.—*Net Disbursements of Veterans Administration in Fiscal Year 1942*

Purpose	Disbursements
Salaries and expense	$104,539,046.33*
Printing and binding	155,032.86
Public Works Administration act of 1938 (allotment to Veterans administration 1938–1942)	42,502.37
Hospital and domiciliary facilities and services, Veterans administration	4,002,650.93
Army and navy pensions	431,298,459.93
Military and naval insurance	15,490,931.27
United States government life insurance fund	44,481,192.02
National service life insurance	960,608.14
Adjusted service certificate fund	43,227,404.24†
Adjusted service and dependent pay	253,196.34
Vocational training	—3,641.63‡
Allotments and allowances	—2,217.06‡
General post fund	35,906.51
Funds due incompetent beneficiaries	124,148.39
Personal funds of patients, Veterans administration	2,702,885.67
Miscellaneous	25,885.59
Total	$647,333,991.90

*Includes adjustments on lapsed appropriations—medical and hospital services, credit of $2,071.40 and national homes for disabled volunteer soldiers, credit of $5.60; also includes net disbursements of $987,004.75 made to other government agencies for the care and treatment of Veterans administration beneficiaries.

†Includes amounts for repayment of loans, due to a change in method of reporting as of July 1, 1941, to conform to Executive Order No. 8512 and Regulation No. 1 issued pursuant thereto. Actual disbursements for fiscal year 1942 amounted to $1,659,220.95.

‡Credits.

Co-operative Employment Activities.—The Veterans administration maintains personal contact with local representatives of the United States employment service of the Social Security board and other government agencies with regard to employment of veterans. Employment service reports show that on June 30, 1942, the number of unemployed veterans registered for employment was 152,130 as compared with 212,984 June 30, 1941.

(F. T. Hi.)

Veterans of Foreign Wars.

Between Dec. 8, 1941, and Sept. 1, 1942—the close of its fiscal year—the V.F.W.'s war programs included:

1. Presentation to the U.S. government of fifteen $10,000 trainer planes for use by the army air forces. The entire $150,000 was voluntarily contributed by V.F.W. posts and members.

2. Organization of an aviation cadet recruiting program. Under the direction of a national chairman, local posts throughout the country were advised and instructed in the recruiting of young men for the army air forces. As a result, as of Sept. 1, 1942, more than 6,500 V.F.W. candidates had been sent to the army air corps for aviation cadet training. More than 14,000 additional candidates were receiving V.F.W. instruction so that they, too, might qualify as aviation cadets. This instruction included coaching by co-operating instructors to overcome educational defects and medical examinations to check physical qualifications so that operations and medical treatment could repair minor physical handicaps.

3. Purchase of government war savings bonds and stamps by individual members and V.F.W. units.

4. Local war programs included a wide range of activities from canteens and entertainment for service men to "letters-from-home" clubs sending weekly news letters to all men in service from their respective communities, the distribution of pocket-size New Testaments or Prayer Books, farewell parties to all local men leaving for service, the presentation of community "honour rolls" bearing the names of all local men in uniform and scores of similar projects.

5. Nation-wide distribution of war posters through local posts and placing on display in post headquarters, bus and railroad stations, in post offices, on bulletin boards at army camps and naval stations and in many other places where they contributed to the morale of the armed forces and stimulated public unity. One of these posters "Stop, Look and Listen" was printed, in mat form, in a total of 546 newspapers throughout the country. Similar patriotic features were the Memorial day full-page features published under V.F.W. auspices in 331 daily and weekly newspapers.

6. A nation-wide distribution of service star window cards to the families of men in uniform. The co-operation of more than 1,000 newspapers and more radio stations brought the V.F.W. offer of these cards, gratis, to millions of American homes. By the end of the fiscal year, Sept. 1, 1942, more than 350,000 of the cards—bearing from one to six stars—had been sent to mothers and fathers, wives, sisters and brothers and sons and daughters of members of the armed forces.

Besides these war-time activities, the V.F.W. program, as always, stressed veteran welfare, child care and Americanism. Rapid membership increases, as soldiers, sailors and marines became eligible when they entered the combat zones of World War II, added many thousands of World War II participants to the membership rolls which previously had consisted of more than a quarter of a million veterans of World War I, the Spanish-American War and other campaigns and armed expeditions in which the United States had been involved since the founding of the V.F.W. in 1899.

"United We Win" was the theme of the 1942 national encampment held at Cincinnati, Ohio. Officers elected to serve for the 1942–1943 term were: Robert T. Merrill, Havre, Mont., commander-in-chief; Carl J. Schoeninger, Detroit, Mich., senior vice commander-in-chief; Jean A. Brunner, Brooklyn, N.Y., junior vice commander-in-chief; R. B. Handy, Jr., Kansas City, Mo., adjutant-quartermaster general; Louis E. Starr, Portland, Ore., judge advocate general; Joseph M. Stack, Pittsburgh, Pa., chief of staff; Clarence R. Christie, Seattle, Wash., inspector general; Dr. George M. Lochner, St. Petersburg, Fla., surgeon general; Rabbi Michael Aaronsohn, Cincinnati, national chaplain; Robert E. Kernodle, Kansas City, Mo., national historian and Teller Ammons, Denver, Colo., national patriotic instructor. (B. Y.)

Veterinary Medicine.

Veterinary preparedness committees were appointed in each state under the authority of the procurement and assignment service. Local draft boards, governed by information provided by these committees co-operated in the effort to prevent the removal of rural veterinarians from regions densely populated with food-producing animals or threatened by sweeping epizootics which cut down food supply.

Veterinary Corps.—Since meat and milk inspection had been a specialized branch of the American veterinary college curriculums from 1890 on, food inspection by the veterinary corps, which operates under the direction of the surgeon general of the army, grew in magnitude and importance with the expansion of the military forces and their distribution to various parts of the world. Contrary to the popular impression that veterinary officers are not needed in mechanized warfare, commanders of U.S. troops in foreign countries, accustomed to the protection of health afforded by modern methods of food inspection requested the surgeon general to provide them with this service. To name but one of many examples, the dairy cows of Iceland, furnishing milk to U.S. troops were tested for tuberculosis as a health measure.

Vaccination of Military Animals.—Over 12,000 horses and mules were used in the simulated warfare carried out in Louisiana, where encephalitis, tetanus and anthrax are prevalent. All of these animals were vaccinated with chick-embryo-encephalitis vaccine, tetanus toxoid and intradermal anthrax vaccine made at the veterinary laboratory of the medical centre in Washington. The consequence of the precaution taken was that no case of these infections occurred as a result of these manoeuvres. The result was particularly pronounced for tetanus, since horses and mules are highly susceptible to that disease and more than 300 distinctly tetanogenic wounds were treated at the veterinary field hospitals during the training period. In view of the infectious character of the terrain occupied, the complete control of tetanus by vaccination demonstrated the preventive merits of tetanus toxoid in military animals.

Veterinary Medicine Honoured.—In creating the rank of brigadier general in the Veterinary corps of the army, President Roosevelt paid tribute to the veterinary service. Col. R. A. Kelser, director of the corps was promoted to that rank March 17, 1942. General Kelser was also awarded the Twelfth International Congress prize for 1942 by the American Veterinary Medical association.

Poultry Medicine.—Statistical records having shown that the mortality among farm chickens and turkeys is nearly 60% per annum, the government's plan to increase poultry and egg production by merely telling the farmers to hatch more chicks was vigorously challenged by the veterinary service on the ground that trying to raise more poultry without corresponding improvement in poultry hygiene would only increase the appalling death rate and thus diminish rather than augment production. Increasing housing capacity and abolishing the notoriously insanitary customs of poultry raising were the initial steps recommended by the United States bureau of animal industry. In co-operation with state and national societies of veterinarians and poultrymen, short courses on poultry hygiene and poultry pathology were given by many of the state agricultural colleges, and a series of technical bulletins for the guidance of farmers and veterinarians was published and widely distributed. Poultry pathologists from the colleges conducted schools for veterinary practitioners in numerous localities with the object of encouraging them to improve this neglected branch of animal medicine. The result of the combined effort was gratifying.

Military Animals.—A survey of the use of horses, mules and camels by the field armies of World War II, based upon obtainable information showed that animal transportation is still a necessary part of military organization. For transportation of men (cavalry) and of matériel (guns, food, ammunition), the German, Japanese and Italian troops utilized a large number of animals. The conclusion of the U.S. remount service, based upon current information and experiences of World War I, was that as soon as the strength of competing forces in tanks, aeroplanes, guns and infantry become equal, animal transportation might be the deciding factor.

Swine Erysipelas.—Although once rare in the United States, erysipelas is now pronounced one of the three grave diseases of swine, namely: cholera, paratyphoid enteritis and erysipelas. A step taken toward its control was the permission granted by the government to use the serum-culture method of vaccination. Owing to the danger of spreading the infection through the use of this living vaccine, the method had, hitherto, been prohibited. Only the antiserum which confers but transient passive immunity was permitted until 1942. The developments of 1942 showed that swine erysipelas is a menace of the first rank to the people's food supply. An outbreak in horses, the first of record in the U.S., occurred in Iowa and numerous veterinarians contracted the disease (erysipeloid) while handling infected hogs or the vaccine.

Swine Dysentery.—In the effort to increase the hog crop to 100,000,000 head in obedience to the government's urge, certain swine breeders of the middle west increased their herds beyond their ability to care for them. The increment and the heavy rains of the summer season of 1942 brought about widespread outbreaks of intestinal infections which led to the belief that a new disease had struck the swine-growing industry, when in fact the incident proved to be but the increased virulence of an old malady.

Canine Medicine.—A war-dog service was organized in the remount division of the quartermaster department of the army. Although dogs were employed for various purposes in all of the modern armies, the first dog service in the United States army was established in 1942. From a small beginning of a few hundred dogs for guarding important centres of production, the quartermaster general set up a training centre for military dogs at Front Royal, Va., which forecasts an extensive development of this new departure. Concurrently with the mobilization of a large number of dogs, came the necessity of instituting measures for preventing the more common dog maladies: distemper, rabies, mange, malnutrition and various avitaminoses, deadly to the canine species.

Bovine Brucellosis.—As a destroyer of food—meat and milk—brucellosis of cattle ranks high. (This disease is more commonly known as contagious abortion or Bang's disease.) Encouraged by the success attained in eradicating bovine tuberculosis, the veterinary service set out to exterminate this disease in cattle and swine. Developments of 1942 indicated that the infection, particularly that of swine, is responsible for the increasing incidence of undulant fever of man. A conference of health officials and veterinarians of the federal and state services held at Council Bluffs, Iowa, in June 1942, clearly established the relationship of brucellosis in swine and man, and in swine and cattle. A well controlled investigation of an outbreak of undulant fever in an Iowa city (Marcus) showed that brucellosis of dairy cows contracted from swine was the source responsible for the infection in the human victims: hog to cow to man.

In Great Britain, struggling to become as self-contained as conditions permit, brucellosis of cattle was rated as a major threat to the effort. The success achieved in the United States from vaccination with an attenuated culture of Brucella abortus properly combined with sanitary measures, resulted in the adoption of the American method in England. A scientist of the United States bureau of animal industry who was invited to visit England to make a tour of investigation, installed the plan which gave promising results during the past two years in the U.S.

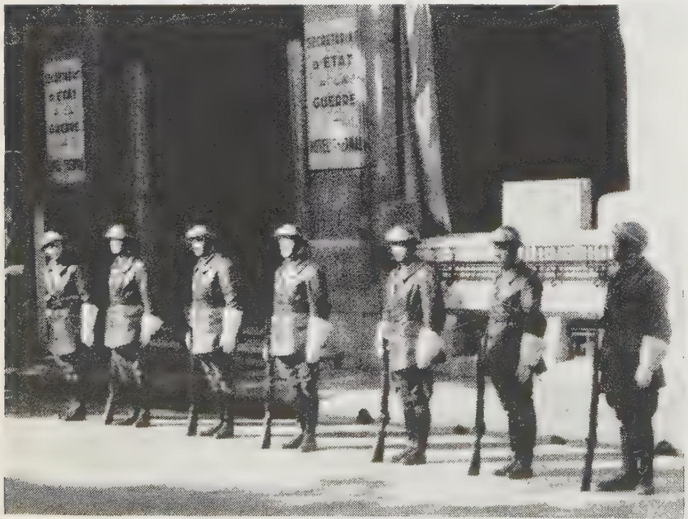
Vichy. A town of central France, department of Allier, located on the right bank of the Allier river, 33 mi. southeast of Moulins; pop. (1939), 20,000. Vichy has been an internationally famous medicinal spa since the latter part of the 17th century; its alkaline waters are especially recommended for diseases of the stomach and the liver, including diabetes and gout.

Vichy first acquired political importance in the summer of 1940, when the French government, formed after the loss of the war to Germany and headed by Chief of State Marshal Henri Philippe Pétain (*q.v.*), established itself there. It was unwilling to return to Paris because of the German military occupation, and Vichy was convenient as a temporary seat of government because of the large number of hotels and sanatoria which could be converted to use as official residences and offices. What was originally regarded as a temporary makeshift arrangement continued through 1942, since the war did not come to an end and no final peace was concluded between Germany and France. A rapid succession of events, initiated by the U.S. and British landing in French North Africa on Nov. 8, led to the disappearance of even the semblance of independence formerly maintained by the Vichy regime. Admiral Jean François Darlan (*q.v.*), a former premier of the Vichy government and formerly minister of marine, passed over to the United Nations' side and carried on in North Africa as civil administrator until his assassination. Repudiating the armistice, Hitler occupied all France. The greater part of the French fleet, stationed at Toulon, was scuttled by its crew to prevent the ships from falling into axis hands. The stage seemed set for a return to Paris of whatever puppet regime Germany might wish to maintain in France. (*See* also FRANCE.)

(W. H. CH.)



PÉTAIN'S GUARD stationed in front of the office of the secretary of war at Vichy in 1942, before German occupation of all France

Victoria. A state of the Australian commonwealth, area 87,844 sq.mi.; pop. (est. Dec. 31, 1941), 1,952,152. Chief cities (pop. Dec. 31, 1939): Melbourne (Cap., 1,046,750); Geelong (40,100); Ballarat (38,590); Bendigo (30,150). Governor (1942): Maj. Gen. Sir W. J. Dugan.

History.—In July 1942 the Victorian Labour party decided to end its alignment with the Dunstan (Country party) government, which it had supported for more than seven years. The Labour party objected to Albert Dunstan's opposition to the commonwealth government's uniform tax legislation, and his general attitude toward the commonwealth. The defeat of the government was avoided, however, by Everard, the leader of the United Australia party (opposition) moving a vote of confidence in the government before the Labour party was able to move a nonconfidence motion. The motion was carried by 36 votes to 19, and the U.A.P. took its place on the cross-benches in support of the government while Labour became the official opposition.

The state budget which was presented in August revealed a surplus of £A.792,000 for 1941–42 which was to be set aside for the erection of buildings such as hospitals and schools. Estimates for 1942–43 provided for a surplus of £A.85,000, revenue being estimated at £A.32,541,000 and expenditure at £A.32,456,000. Features of the budget were increased pay for police and other public servants, a cut of about 50% in suburban rail fares for servicemen and a reduction in land tax on land used for primary production.

In August the city of Melbourne celebrated the centenary of its incorporation as a municipality and a congratulatory message was received from his majesty the king.

Education.—In 1939: state primary schools, 2,585; scholars on roll, 221,219; average attendance, 155,441. State secondary schools, 154; scholars on roll, 42,104; average attendance, 34,176.

Finance.—In 1942–43 (estimated) revenue £A.32,541,000; expenditure £A.32,456,000; debt outstanding (June 30, 1941) £A.181,219,000.

Communication.—Roads and streets fit for motor traffic (Sept. 30, 1939) 103,929 mi. Railways (1940–41) 4,745 mi. Motor vehicles licensed (March 31, 1942): cars, trucks, etc., 211,441; cycles 18,166. Wireless receiving set licences (March 31, 1942) 372,010. Telephones (June 30, 1941) 228,936.

Agriculture, Manufactures, Mineral Production.—Production in 1941–42: wheat 47,000,000 bu.; wool (1940–41) 185,000,000 lb.; coal, brown (1940) 3,994,515 tons; gold (1939) 156,522 fine ounces. Industry and labour, 1940–41: factories 9,121; employees 237,636; gross value of output £A.209,348,845; unemployment (trade union returns) (March 1942), 1.4%. (W. D. MA.)

Victory Tax: *see* TAXATION.

Virginia. Southernmost of the middle Atlantic states, the "Old Dominion" was one of the 13 original United States; first permanently settled at Jamestown in 1607. Area, 40,815 sq.mi.; pop. (1940) 2,677,773. Of the population, 35.3% were urban and 64.7% rural. An estimate based upon 5% of the census showed a white population of 2,013,723, nonwhite of 664,050. Capital, Richmond (193,042, increased by annexation to 213,500 on the basis of 1940 census figures). Other cities include Norfolk (144,332) and Roanoke (69,287). Richmond's metropolitan population was estimated in Dec. 1942, at 258,000; the Norfolk-Portsmouth-Newport News area at 429,000.

History.—The biennial session of the general assembly began Jan. 14 and ended March 14. The war program outlined by Governor Colgate W. Darden, Jr., in his inaugural address Jan. 21 was substantially and quickly made law. The assembly established a state department of corrections to introduce into Virginia a system of probation and parole; established a retirement system for state employees and school teachers; established a personnel and merit rating system for state employees; made the governor director of civilian defense; added $5,000,000 to the sinking fund, and simplified the administration of several state departments. A special session of the assembly met from Sept. 29 to Oct. 1. Approving unanimously the governor's suggestion, the legislature provided for eventual liquidation of the state debt by transferring an additional $10,000,000 of an unobligated surplus of $18,639,879.66 from the treasury to the sinking fund for the purchase of federal government bonds. The governor in 1942 (elected in Nov. 1941) was Colgate W. Darden, Jr.; William M. Tuck was lieutenant-governor.

Education.—In 1941–42, elementary school enrolment was 449,657; teaching staff, 12,416; secondary school enrolment, 136,525; teaching staff, 5,660.

Public Welfare, Charities, Correction.—For the year ended June 30, 1942, 6,314 persons received $910,673.95 in general relief; 19,783 persons received $2,454,481.19 in old-age assistance; 14,313 dependent children, $1,164,015.66; 1,081 blind, $163,727.70; and in 1942 (January through November) 289,432 unemployment compensation checks were written for $2,655,778.98. An average daily population of 4,557 were in five penal institutions for adults and 772 were in four industrial schools for juveniles.

Communications.—On Jan. 1, 1942, there were 9,459.9 mi. of highway in the state's primary system; on July 1, 1942, there were 37,486.61 mi. in the secondary system. During the year ended June 30, 1942, the state spent $31,305,304.24 on the highways. Railroad mileage in Virginia was 4,203.2 on Jan. 1, 1942. There were 302,585 telephones in Virginia on Nov. 30, 1942.

Banking and Finance.—On Dec. 31, 1941, Virginia had 184 state banks and branches and 130 national banks and branches. Deposits of the former totalled $337,776,000; of the latter, $506,799,000; assets of the state banks, $379,985,000; of national banks, $563,380,000. Resources of 19 industrial loan associations, 58 building and loan associations, and 32 credit unions were $46,933,207. The state budget for the fiscal year ended June 30, 1942, showed receipts of $134,534,252; expenditures, $122,729,989. The gross debt on June 30 was $18,888,996.75; the net debt, $12,580,802.99; in the sinking fund, $6,308,193.76. Later in the year $15,000,000 was added to the sinking fund by authorization of the state legislature.

Agriculture.—The value of Virginia's principal crops in 1942 was estimated at $172,127,000, an increase of 39% over 1941. Acreage harvested advanced 6% above the 1941 figure to 3,851,000 acres. Yields of most crops were above the recorded average, but a wet fall hampered harvesting activities, and a shortage of farm labour became increasingly acute as the year advanced. The farm income in 1942 was estimated at more than 35% higher than in 1941, when the income was $158,260,000. Of the latter amount, $77,821,000 came from crops, $73,915,000 from livestock, and $6,524,000 from government payments. Tobacco, first in value of production at $40,346,000, was worth 60% more than in 1941.

Manufacturing.—The total value of manufactures in 1940 was $1,255,354,533. Wage earners were paid $184,506,695. The principal industries were tobacco products, transportation equipment, textiles, food products and paper and printing.

Mineral Production.—The value of mineral production in 1940 was $37,670,935; 19,057 wage earners were paid $20,382,889. The two leading minerals were coal (valued at $27,103,764 in 1940) and coke ($928,239). (J. S. Br.)

Leading Agricultural Products of Virginia, 1942 and 1941

Crop	1942 (estimated)	1941
Tobacco, lb.	106,528,000	88,572,000
Cotton, lint, bales	33,000	28,000
Corn, bu.	33,586,000	32,942,000
Oats, bu.	3,510,000	2,625,000
Barley, bu.	2,120,000	1,800,000
Apples, commercial, bu.	13,908,000	11,800,000
Peaches, bu.	1,936,000	1,860,000
Wheat, winter, bu.	7,520,000	7,665,000
Hay, all tame, tons	1,489,000	1,257,000
Lespedeza seed, lb.	9,200,000	6,800,000
Potatoes, bu.	7,242,000	6,808,000
Sweet potatoes, bu.	3,875,000	2,970,000
Peanuts for nuts, lb.	201,500,000	169,510,000
Soybeans for beans, bu.	1,782,000	638,000

Virginia, University of. A state institution for higher education at Charlottesville, Va. The original university was designed and built by Thomas Jefferson. There are six departments: two academic—the college and department of graduate studies; and four professional—law, medicine, engineering and education. The total budget for 1942–43 was $3,030,609. The corporate name of the university is "The Rector and Visitors of the University of Virginia." For statistics of student enrolment, faculty members, endowment, library volumes, etc., *see* Universities and Colleges. (J. L. N.)

Virgin Islands. A United States dependency in the West Indies, east of Puerto Rico, comprising St. Croix (pop. 12,902), St. Thomas (11,265) and St. John (722) islands. Area, 133 sq.mi.; pop. (1940) 24,889, 13.1% more than in 1930, with whites 9%, Negroes 69% (1930: 78.3%), "mixed and other races" 22% (1930: 12½%). The chief cities are: Charlotte Amalie, the capital, on St. Thomas, 9,801 (1930: 7,036); Christiansted, 4,495 (1930: 3,767) and Frederiksted, 2,498 (1930: 2,698) on St. Croix. The governor in 1942 was Charles Harwood.

History.—In 1942 the Virgin Islands celebrated the 25th anniversary of their transfer from Denmark to the United States. The effects of World War II were felt heavily in continued loss of tourist trade and various restrictions and economic dislocations. Rationing was begun on many articles, notably gasoline.

Education.—In 1941, there were 26 elementary schools (3,281 enrolment, including 1,471 in eight accredited private schools), and three high schools (enrolment: 750).

Finance.—The monetary unit is the United States dollar. An annual United States government subsidy is made to assist in defraying government expenses. The total budget for 1942 was $889,845.

Trade.—Under wartime conditions in 1942 official policy was to withhold full trade statistics. Nevertheless, trade, although restricted to strategic and war related movements, increased greatly in 1942 as indicated by a doubling of the revenues of St. Thomas, principally derived from commercial sources. Imports from the United States (normally 60–75% of the total) were valued at $3,023,979 in 1940; exports (normally around 95% of the total) $1,448,020, and in the first nine months of 1941, $3,003,200 and $1,725,053 respectively. Rum, bay rum, and sugar provided most of the exports.

Communication.—External communication is by steamer and Pan American Airways, through Charlotte Amalie. Inter-island traffic is by boat.

Agriculture.—Agriculture supplements shipping to support St. Thomas. St. Croix and St. John are largely agricultural. In 1940 there were 828 "farms" of 3 ac. or more, totalling 55,228 ac. St. Croix produces practically the entire sugar crop of the islands. Vegetable, orchard products (guava, cacao, coco-nuts, limes, lemons and oranges), and livestock comprise the remainder.

Manufacturing.—Local manufactures for export were greatly restricted in 1942 because of the shipping shortages. As a result, sales dropped from a 1941 total of $55,357.77 to $32,798.66. (C. L. G.)

Visser, Lodewijk Ernst (1871–1942), Dutch jurist, was born August 21 in Amersfoort and studied law at the University of Utrecht. He taught for a time at the University of Amsterdam before becoming judge of the Rotterdam Court of Justice in 1903. He was named judge of the Netherlands High Court of Justice in 1915 and rose to the position of president of the court in 1939. He held the latter post until he was ousted by the Germans shortly after the invasion of May 1940. Visser was active in Jewish welfare work and had been president of the Jewish community of The Hague. He died in the Netherlands, February 24, according to a Dutch news agency report.

Vital Statistics: *see* BIRTH STATISTICS; CENSUS, 1940; DEATH STATISTICS; INFANT MORTALITY; MARRIAGE AND DIVORCE; SUICIDE STATISTICS.

Vitamins. Significant advances were made particularly in the biochemistry and physiology of some of the members of the vitamin B complex. The work on biotin was probably most intensive, resulting in definite knowledge of its chemical structure and some indications of its role in physiology and its importance to man. Climaxing chemical studies of several years, DuVigneaud in association with Melville and Hoffman and other students obtained conclusive proof of the probable structure of biotin and effected a synthesis of the compound. In 1941 it was shown that biotin has the empirical formula $C_{10}H_{16}O_3N_2S$. In 1942 it was found that the compound consisted of a cyclic urea structure combined with a five-membered ring structure containing sulphur and having an aliphatic acid side chain. The exact position of the valeric acid side chain had not been established but the investigators believed that it was attached to one of the carbon atoms adjacent to the sulphur.

Some interesting observations were reported by Sydenstricker and his collaborators, who maintained a group of human volunteers on foods which supplied a minimal amount of this factor of the B complex. In the seventh week on such a diet all the subjects developed a grayish pallor of the skin, and in one person there was observed a maculosquamous dermatitis of the hands, arms and legs. Some of the patients developed atrophy of the lingual papillae, but in none were there observed the characteristic tongue lesions found in riboflavin and nicotinic acid deficiencies. The neurologic symptoms reported after five weeks on the deficient diet were strikingly similar to those that had been prominent in induced thiamin deficiency in man. These symptoms consisted of a mild depression, lassitude, sleeplessness, and were accompanied by loss of appetite. Despite the administration of iron the blood showed a deficiency in haemoglobin content. Treatment with a preparation supplying from 75 to 300 micrograms of biotin daily effected prompt relief within from three to five days. The authors emphasized that the signs and symptoms observed were similar to those seen in some cases of spontaneous nutritional deficiency, which perhaps is to be expected because dietary deficiencies in man are apt to be multiple in nature.

There was some interest in the possibility of treating certain types of cancer by procedures designed to withhold biotin from the cells. Because of the observations of Sydenstricker and his collaborators it seemed doubtful that such studies would be fruitful for, although the cancer cells may need biotin, the normal cells also require this factor. One method of reducing the biotin intake was through the feeding of large amounts of raw egg white. This food contains avidin, a protein which combines with biotin and prevents its absorption. Coagulated egg white does not have this effect.

Students of nutrition were becoming increasingly aware of the probable importance of intestinal bacteria in synthesizing some of the vitamins. This was particularly well known in the case of vitamin K, the anti-haemorrhagic vitamin which can be synthesized by common intestinal organisms. Burkholder and McVeagh grew pure cultures of six common intestinal organisms in synthetic media. It was found that one organism, *B. mesentericus,* required biotin for its growth and another, *P. vulgaris,* required nicotinic acid. These two organisms, however, were able to synthesize the remaining vitamins that were studied and four other species of bacteria produced appreciable quantities of thiamin, riboflavin, biotin and nicotinic acid. Most of the vitamins were found to be within the bacterial cell, which indicated that bacteria synthesize the vitamins for their own metabolism. Some of the vitamins had leeched out into the culture media, however, and it seemed quite possible that the intestinal bacteria which inhabit the alimentary tract of man throughout life (beginning from a few days after birth) may be of some benefit through their ability to synthesize dietary essentials which are needed, not only for the unicellular organism which makes the vitamin but also for the complex multicellular host.

An interesting technique for the study of the importance of the intestinal microorganisms in nutrition was provided by the oral administration of sulphaguanidine or the newer drug, sulphasuxidine (succinyl sulphathiazole). These drugs are effective bacteriostatic agents for intestinal organisms and their administration to experimental animals results in a retardation of growth. This retardation of growth may be counteracted by the administration of liver extract (which supplies more of the B complex) or para-aminobenzoic acid (which antagonizes the effect of the sulphonamide drugs). In the rat the administration of sulphaguanidine resulted in a state of hypoprothrombinaemia, probably because of inhibition of vitamin K synthesis in the intestinal tract, but this deficiency was not sufficient to delay the clotting time of the blood in these animals. Nielsen and Elvehjem showed that the retardation of growth caused by feeding sulphasuxidine can be counteracted by biotin and also by folic acid. The latter compound was studied intensively by R. J. Williams. It is found in green leaves and is considered to be a member of the vitamin B complex.

It appeared evident that the less well known members of the vitamin B complex will ultimately be found to be important in human nutrition. Pilgrim, Axelrod and Elvehjem showed that pantothenic acid and biotin are involved in the metabolism of pyruvic acid, an intermediate in carbohydrate metabolism which hitherto was thought to require only an enzyme containing thiamin for its further oxidation. Pyruvates accumulate in the blood of men who are maintained on a thiamin deficient diet. There was evidence that certain members of the vitamin B complex are essential for the development and maintenance of normal tooth structure. Choline undoubtedly is of importance in several ways. Pantothenic acid deficiency in experimental animals, particularly in young animals, was so striking and so severe that its importance in human nutrition seemed a certainty. These facts emphasized the importance of obtaining an adequate diet complete in all nutritional factors, especially those of the vitamin B complex.

Observations on human beings indicated that the minimum daily requirement of men for thiamin is about 0.5 mg. for each 1,000 calories, but a more desirable intake is probably about 1 mg. for each 1,000 calories. In the United States the increased availability of enriched flour, which provided more thiamin and niacin and iron than ordinary white flour, was a distinct aid in helping to secure the thiamin requirement, as shown by the experiments of Lane, Johnson and Williams.

A number of new reports appeared on the effect of maintenance of human beings on thiamin deficient diets. Wilder and his collaborators noted vague subjective symptoms of discomfort and nervous instability, as well as objective signs of poor health. The most significant observation perhaps was the loss of ability to do muscular work. Similar results were reported by Egana and his collaborators who maintained seven healthy physicians on a diet deficient in the vitamin B complex. They noted loss of ambition, increased fatigue, and lowered efficiency in their work. There was developed in less than a month a moderate deterioration of the ability of the subjects to undergo exhausting exercise. The investigators reported that more severe disability was observed when persons accustomed to vigorous exercise were maintained on deficient diets. All of these signs and symptoms were relieved by administration of the vitamin B complex.

Other studies of interest which may be mentioned were the demonstration that vitamin A along with vitamin C is of great importance in the diet of the patient with tuberculosis, and the observation that increased amounts of vitamin C may be needed to maintain the patient with pernicious anaemia who is receiving treatment with liver extract. Improvements in the technique of medical evaluation of nutritional status, especially with regard to mild deficiency of vitamins, continued and Kruse and his collaborators reported some interesting signs of what they consider to be deficiencies of ascorbic acid, niacin, riboflavin and vitamin A. Further work would be necessary before the importance of these studies can be fully evaluated.

Applications of vitamin research to human welfare were evidenced by the first order of Food Administrator Wickard in the United States to the effect that beginning Jan. 18, 1943, all flour and bread must be enriched in accordance with specifications of the Food and Drug administration pertaining to these products. Beginning Jan. 1, 1942, steps were undertaken to give all British children fish liver oil and orange juice as sources of vitamins D and C. Surveys of population groups were made in both Britain and the United States and Canada for the purpose of checking on the nutritive status of civilians. In such studies the vitamins along with protein and the other components of an adequate diet were shown to be of the greatest importance to the maintenance of health. A study by Dorothy G. Wiehl showed that the diets of a group of aircraft workers in southern California were markedly deficient in riboflavin and ascorbic acid. The remedy for poor diets of industrial workers was improvement in the diet rather than in the indiscriminate administration of vitamin preparations, according to a report of the Council on Foods and Nutrition of the American Medical association. If vitamin mixtures are to be used for therapeutic purposes another report of the same association described the principles involved in the rational formulation of such mixtures according to the daily dietary requirement for each vitamin. Of interest to persons concerned with the calculations of diets was a report by Booher, Hartzler and Hewston of the Bureau of Home Economics, U.S. department of agriculture, on the vitamin values of foods in relation to processing and other variants.

Voliva, Wilbur Glenn (1870–1942), U.S. clergyman, was born March 10 near Newtown, Ind. Son of an Indiana lawyer, he was ordained minister in the Christian Church in 1889 and later joined the sect known as the Christian Catholic Apostolic Church in Zion. Voliva became a close associate of John Alexander Dowie, Australian evangelist who founded the sect. In 1901 Dowie established a community for his flock at Zion, Ill., on the shores of Lake Michigan. But in 1906 the Zion congregation repudiated Dowie, and Voliva stepped into the role of overseer. Voliva then acquired all of Zion's real estate and expanded the city into an $11,000,000 business and religious institution. He got into financial difficulties in the early 1930s and on several occasions his parishioners tried to force him into bankruptcy. A fundamentalist, Voliva insisted the world was flat, although he had made a round-the-world cruise. He forbade his followers in Zion to drink, smoke, chew gum, swear, dance or to eat pork and oysters. He persistently predicted the end of the world and expected to live to the age of 120. He died in Chicago, Oct. 11.

Von (in personal names): *see* under proper names.

Voroshilov, Klementiy E. (1881–   ), Russian army officer, was born Feb. 4 in Verkhnyi, Ukraine. In 1903, he joined the Social-Democratic party. He was exiled to Archangel in 1907 for revolutionary activities but escaped to Baku. During World War I, he was a revolutionary organizer, but after the bolsheviks seized power he entered active military life. He led guerrilla detachments against German armies in the Ukraine in 1918. He was people's commissar of the army and navy in 1925 and was a member of the Communist party central committee after 1921. On May 8, 1940, Voroshilov was named vice-premier and Marshal Timoshenko succeeded him as defense commissar. In Aug. 1941, Marshal Voroshilov was in command of the northwestern front which included Leningrad, and in Oct. 1941, he was charged with formation of new Russian armies. He was then returned to the Leningrad area and was in command of Russian troops that attempted to batter their way out of nazi siege lines in Jan. 1942. In August, he attended the Churchill-Stalin conference in Moscow.

Wages and Hours. During 1942 employment and pay rolls in manufacturing and non-manufacturing industries improved substantially as a result of World War II orders and the U.S. war program. Improvement became particularly noticeable during the latter part of 1940 and proceeded continuously to higher and higher levels. Portland, Ore., had the highest known index of employment in Nov. 1942, with 383 (1937=100). The government had discontinued releasing indexes for such cities with war work, but it was announced that in Nov. 1942, 34 cities had employment indexes above 150, though four cities had lower employment indexes than in Sept. 1937. Table I shows the employment indexes for 1941 and the first eight months of 1942. Table I and Table II show improved employment and higher average weekly earnings during the first half of 1942 as compared with the first half of 1941.

Employment during the first eight months of 1942 was about 15% better than during the corresponding months of 1941 (Table I). This was caused principally by the improvement in employment in the durable goods industries where employment increased more than 20% over the corresponding months in 1941.

Table I.—*Employment, Pay Rolls and Earnings in Manufacturing Industries in the U.S. in 1942 and 1941*

(Indexes are based on 3-year average, 1923–25=100, and are adjusted to preliminary 1939 census of manufacturers. Not comparable to indexes published by the U.S. Bureau of Labor Statistics prior to August 1939.)

This table compiled from tables published monthly in the *Monthly Labor Review*, United States Bureau of Labor Statistics.

During the period 1937–39 average hourly earnings increased. This was an unusual event. In periods of increased unemployment such as prevailed from late 1937 through 1938, labour ordinarily experiences reductions rather than increases in average hourly earnings. The contra-cyclical rise in hourly earnings 1937–39 appears to have been the result principally of the upsurge of unionism which began in 1933–34. By 1937 a large number of the new unions had become sufficiently consolidated and effective, and the older unions sufficiently strengthened, so that their increased bargaining power more than counterbalanced the temporarily adverse business trend of late 1937 and 1938 and enabled them, both in union and nonunion industries, to push the wage level higher. In the first half of 1940 the higher hourly earnings were maintained but not increased in the majority of industries. Table II shows that hourly earnings rose gradually and with increasing rapidity in late 1941 and in 1942, both because of increases in rates and because of overtime.

The bureau of labour statistics figures show a downward trend of hours in most industries, from 1937 to 1939 because of reduction in hours-standards effected by union agreements. But in 1941 and 1942 average hours increased, particularly in the heavy industries, because so much overtime was worked as a result of the war.

The much higher hourly earnings in some industries are due to one or more of the following factors: (1) character of the labour supply employed, as to sex, age and skill, (2) productivity of the industry, principally determined by its degree of modernization, technical equipment and proportion of skilled workers, (3) degree to which union working conditions prevail, (4) necessity of paying high wages to attract labour supply.

Weekly earnings are really of greater significance than hourly rates, from the point of view of living standards. There were 16 industries of the 24 studied in which average weekly earnings exceeded $30 per week in July 1941, and the maximum was $40.50 in the transportation equipment industries. The lowest weekly earnings were in hotels: $16.03. In July 1942, there were 17 industries in which average weekly earnings exceeded $30 and six where they exceeded $40 per week. Three of these were: $50.93 in transportation equipment; $46.04 in machinery; and $43.42 in construction. The lowest, hotels, were but $16.69. The average weekly earnings of durable goods manufacturers were $44.62 in July 1942 compared with $31.24 a year earlier and $28.52 in 1940.

Table II.—*Average Hours per Week, Average Earnings per Hour, and Average Weekly Earnings in Major Industrial Classifications, January and July, 1942 and 1941 in the U.S.*

(Compiled from the *Monthly Labor Review* of the United States Bureau of Labor Statistics)

Building	.924	.956	1.001	1.174

Four industries fell between $20 and $25 per week and four between $25 and $30; none below $20 in July 1942.

The wages of farm labour were higher in 1942 than in 1941, judging by the reports of the U.S. bureau of agricultural economics.

Daily wages, with board, averaged $2.76 on Oct. 1, 1942, and ranged from $6.10 in the state of Washington down to $1.25 per day in South Carolina. (*See* also AGRICULTURE; BUSINESS REVIEW; CANADA; CENSUS, 1940; LAW.) (D. D. L.)

Great Britain.—According to the official figures, British wage rates had risen, in July 1942, by 30% above the level prevailing in Aug. 1939, whereas the cost of living had risen by 29%. Both these figures were, however, misleading under the special conditions created by the war. Wage rates no longer bore the same relation to earnings as in normal times, and an average of all trades, or rather of all for which returns were available, was misleading in view of the wide differences in wartime changes from one industry to another. On the other side, the official cost of living index was greatly affected by the policy of keeping the prices of certain essential goods pegged by means of subsidies; for these particular goods were heavily weighted in the composition of the index, which therefore failed to reflect accurately changes in the cost of living as a whole.

It is not possible to compare earnings in 1942 with earnings in 1939, as no prewar figures exist later than Oct. 1938. In Jan. 1942, the latest available returns, average earnings in the trades covered had risen by 46% above the 1938 level (as compared with a rise in wage rates of 26% above 1939). Earnings had risen most (63%) for boys and youths, whereas for men, women and girls the rises were nearly the same (48%, 46% and 45%). Differences between industries are illustrated by the following examples, showing the average rises for all classes of labour: metal, engineering and shipbuilding (56%), textiles (43%), food, drink and tobacco (30%), transport (29%), printing and paper (20%). The high average for all trades was of course due to the great increase in numbers in the metal, etc., group. The earnings of boys and youths in this group had risen by 73% and those of women by 61%. Over all the trades covered weekly earnings averaged 102/—for men, 42/6*d.* for boys and youths, 47/6*d.* for women over 18, and 26/10*d.* for girls, with a general average of 77/9*d.* for all classes. The corresponding averages for metal, engineering and shipbuilding were 119/2*d.*, 45/2*d.*, and 31/—, with an over-all average of 93/—.

There was no authoritative measurement of the real rise in living cost. An estimate made by the Oxford Institute of Statistics put the real rise at 41% to 45%, at the end of 1941, for wage-earning families; and a re-calculation of the Rowntree Minimum Needs Standard for a family of five persons worked out at 89/— a week for April 1942 (34/— food, 55/— other items). Sir John Orr's higher "optimum" standard required in Oct. 1942 a weekly income of at least 29/— per head.

The incomes of the families of men serving with the forces, not included above, were in many cases so low as to have given rise to serious discontent. Until Sept. 1942 the total allowance for the wife of a serving private soldier with three children was 45/— a week, which could be supplemented, subject to a means test, by special war service grants up to about 55/—. Small increases were then announced in the basic allowances; but these failed to satisfy any party in the house of commons, and the matter was still under active discussion at the close of 1942.

About hours of labour there were no general figures available. There was a tendency to cut down the very heavy overtime and week-end work that was common in 1940–41, as it was found that this led to much absenteeism and sickness, and actually lessened output. On the other hand, the reduction in the labour force of the less essential trades led to the working of longer hours by those who remained. In the war trades, a working week of about 56 hours, as against 47 in normal times, was common for men; but there were still wide variations, especially among women. Night work was fairly widely allowed in trades in which it was forbidden before the war; and there was much controversy over certain permits which were given for extending the hours worked by children and young persons.

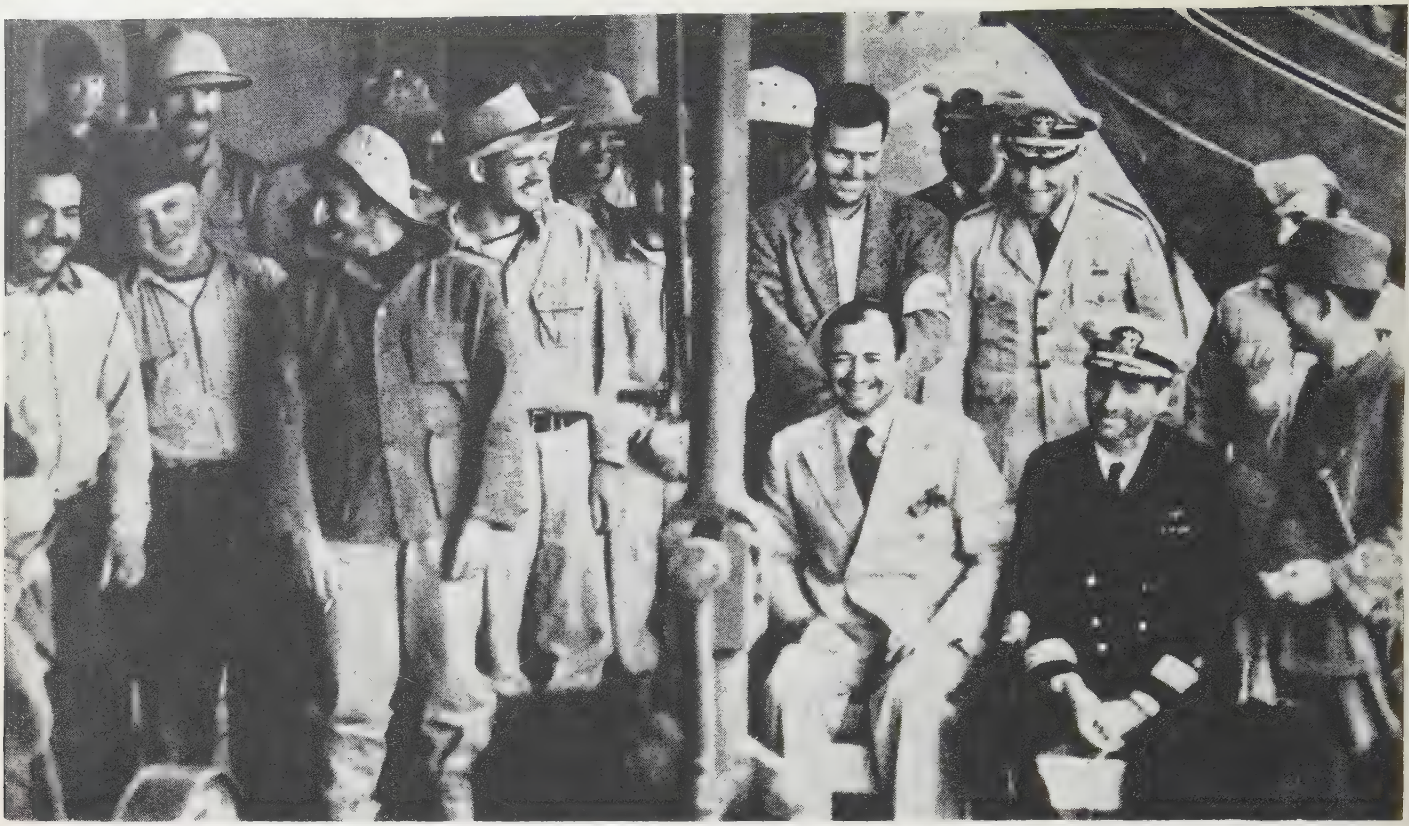
The principal body for settling disputes about wages and hours was in 1942 the National Arbitration Tribunal. This body was set up in connection with the order of 1940 prohibiting strikes without prior reference to the ministry of labour, which could then refer any dispute to arbitration, either by the N.A.T. or by some other body. The government's policy at the close of 1942 was to oppose wage increases except when they were either linked with plans for stimulating output or necessary in order to raise abnormally low wages to a tolerable level. There were, however, a large number of applications for wage advances pending. It was estimated by the Oxford Institute of Statistics that in 1941 wages accounted for 52.9% of national income, as against 52.3% in 1938. This proportion is gross—before direct taxation, which could be estimated at an average of about 9% of working-class incomes. It should be added that for the whole population consumption was estimated early in 1942 to have declined by about 15%. A further decline was in prospect, whatever happened to money wages, owing to the decline in stocks of consumers' goods. (*See* also LABOUR UNIONS; PRICES.) (G. D. H. C.)

Wagner, Boyd David (1916–1942), U.S. army air officer, was born Oct. 26 in Emeigh, Pa. A graduate of the air corps flying schools in 1938, he became a squadron leader during the Philippine campaign in World War II. "Buzz" Wagner was cited for heroism and awarded the D.S.C. when he shot down five enemy planes in close combat and led his squadron in a raid on a Japanese beachhead at Vigan, in the Philippines. He was later transferred to Australia and was skipped three full grades to the rank of lieutenant colonel. The war department announced on Dec. 2 that he had been missing for two days while on a routine flight from Florida to Alabama.

Wainwright, Jonathan M. (1883–), U.S. army officer, was born Aug. 23 in Walla Walla, Wash. He was graduated from West Point in 1906 and served in the Philippines during the Moro uprisings in 1909, and also saw active service in World War I in France. During World War II he was stationed in the Philippines and was second in command to Gen. Douglas MacArthur when the Japanese invaded the Philippines in Dec. 1941. When MacArthur was sent to Australia, Wainwright assumed command on March 17, 1942, of the U.S.-Filipino armies in the Bataan peninsula. Two days later, President Roosevelt raised him to the rank of a lieutenant general. Wainwright led his out-numbered forces with great skill but, lacking supplies and planes, retired in April from Bataan to Corregidor. He held out under a concentrated air and artillery bombardment until May 6, when he was compelled to surrender because his starved and exhausted forces were no longer able to fight. Wainwright, who was awarded the distinguished service medal with an oak leaf cluster for his heroic stand, was interned in a Japanese military prison in Formosa.

Wake Island. A mid-Pacific atoll some 2,600 ac. in area, owned by the United States of America since 1899, Wake island lies in latitude 19° 15′ N., longitude 166° 38′ E. It is about 2,104 mi. west of Honolulu, Hawaii and 1,334 mi. from Port Apra, Guam. By executive order dated Dec. 29, 1934, Wake island was placed under control and jurisdiction of the navy department. Prior to establishment of the Pan American Airways base, under license from the navy department, Wake had no regular inhabitants.

Wake island was attacked by air and sea Dec. 8, 1941, almost



U.S. PRISONERS FROM WAKE ISLAND photographed aboard a Japanese ship after their capture in Dec. 1941. The Japs released many such propaganda pictures of U.S. prisoners in 1942

simultaneously with the Japanese attack on Hawaii (the atoll lies west of the international date line). During the next two weeks a small garrison of 385 U.S. marines repulsed a number of separate attacks and, according to a report of the U.S. navy, knocked three Japanese destroyers, a cruiser and a submarine out of action. On Dec. 22, 1942, after the last U.S. marine plane had been forced down, the Japanese effected a landing and subdued the remainder of the defending garrison.

Japanese installations on Wake island were bombed several times by U.S. air squadrons during 1942. An attack on Christmas day was reported to have caused particularly heavy damage to enemy supplies and equipment.

Wales: *see* Great Britain and Northern Ireland, United Kingdom of.

Wallace, Henry Agard

(1888–), vice-president of the United States. (See *Encyclopædia Britannica.*) Wallace was secretary of agriculture in the cabinet of Franklin D. Roosevelt from March 4, 1933 until Sept. 5, 1940, when he resigned to campaign for the vice-presidency, to which he was elected the following Nov. 5.

In the summer of 1941 he became an important figure in the U.S. defense program. President Roosevelt appointed him head of the Economic Defense board (later the Economic Warfare board) on July 31, and chairman of the Supply Priorities and Allocations board on Aug. 28. In a speech on May 8, 1942, Wallace described World War II as a people's revolution; many persons assailed the speech, particularly his statement about making it possible for everyone in the postwar world to have a quart of milk a day.

On Dec. 28, Wallace, in a speech presumably authorized by the president, envisioned a postwar world federation of nations to preserve peace and maintain economic and political justice.

This proposal was criticized as "impractical" and a prelude to "red communism."

War Chest: *see* Relief.

War Communications, Board of.

Activities of this agency, which was previously called the Defense Communications board (created by President Roosevelt in 1940) were greatly intensified after the outbreak of war between the U.S. and the axis powers. The board in 1942 extended radiotelephone and radiotelegraph circuits to many parts of the world as a service to the armed forces; established a system of telephone priorities which cleared the wires for all messages relating to military necessity or vital public need; assisted broadcasters in the conservation of equipment, in obtaining technical personnel, and in the operation and protection of their stations during wartime. Its members in 1942 were Chairman James Lawrence Fly, also chairman of the Federal Communications commission; Herbert E. Gaston, an assistant secretary of the treasury; Major General Dawson Olmstead, chief signal officer of the army; Captain Carl F. Holden, director of naval communications; and Breckinridge Long, an assistant secretary of state. Advising the board were committees representative of labour, industry, aviation, cable, domestic broadcasting, international broadcasting, radio communications, telegraph, telephone and government, state and municipal facilities. A co-ordinating committee, of which FCC Chief Engineer E. K. Jett was chairman, supervised the work of the advisory committees. (*See* also Federal Communications Commission; Radio.)

[2] Indebtedness to the United States under agreements of June 23, 1930 and May 26, 1932.

(D.W.B.)

War Department, U.S.: *see* GOVERNMENT DEPARTMENTS AND BUREAUS.

Warfare, Incendiary. Several interesting developments in the technique of military incendiaries were noted during 1942, although these had not effected any major modifications in the tactics of incendiary warfare. The most notable incidents as far as concerned the United States were the dropping of appreciable loads of incendiaries by the Japanese in an attempt to fire the Siskiyou national forest in southern Oregon by aerial attack on Sept. 9, 1942. The only bombing of the United States was thus an incendiary attack.

The incendiary was increasingly vying with the explosive bomb in importance as a weapon of aerial warfare. This was evidenced from the fact that in bombing operations the weight of incendiaries very frequently exceeded the weight of explosive bombs dropped, even though more supersized high explosive bombs were used in 1942 than in any preceding year.

Targets sufficiently inflammable to justify attack with incendiaries were in particular cities and industrial establishments lying usually beyond the range of artillery and reachable only by aircraft. Hence the rise of the incendiary as an important military weapon must be viewed as a development of modern aerial warfare.

Against burnable targets, incendiaries were potentially capable of producing wider and more complete destruction than were explosive bombs. However, in any major operation against land targets both types were employed, the proportion of each depending on the nature of the target.

The larger categories of explosive bombs were principally agents of demolition. Their effects, although powerful, were strictly limited as to both time and space. Their normal action was practically instantaneous; and even a 2-ton explosive bomb would seldom cause serious damage beyond a limited definite distance. Incendiaries on the other hand reacted slowly, cumulatively, and, by inducing self-destruction of matériel, produced effects that extended far beyond their points of impact.

The essential technical limitation of the incendiary bomb was that it had to bring fire directly to an object that would burn. A miss of only a few feet was enough to cause the incendiary to burn out harmlessly, while a direct hit on a fire-resistant surface was likewise ineffectual.

Two tactical methods were followed in dropping incendiaries, area bombing and point bombing. Area bombing was usually undertaken from high altitudes. A large number of small incendiaries were scattered over a wide area known to contain a fair proportion of inflammable structures. (Probably 35% of the area should be covered by good incendiary targets.) In area bombing, no attempt was made to hit any particular structure in the area. The ultimate tactical objective of such an operation was to produce a major conflagration. The penetrating power of the small incendiary bombs used in area bombing was low, hence dependence had to be placed on surface fires or on fires started in upper floors of buildings. Dropping of two to four tons of incendiary bombs per square mile of target area was not uncommon in area bombing.

In point (or aimed) bombing of specific targets, use was made of larger incendiary bombs having good penetrating qualities. This method was employed where it was necessary to reach through to well-protected inflammable stores or surfaces. It was also appropriately used against isolated facilities so located as to escape destruction during a conflagration.

Regardless of the materials it employed to produce incendiary action, an effective incendiary bomb had to: (a) generate high heat; (b) for sufficient time to induce combustion.

The kindling point of the target material was in theory the criterion as to the proper relationship between the factors (a) and (b) and hence as to the most suitable incendiary material for use against any given target. In practice, however, availability of raw materials frequently dictated as to production while military logistics tended to limit the variety of incendiary munitions that could be supplied in the field.

Prior to the development of aerial warfare, fires caused by explosion of artillery shell gave some credence to belief that a special incendiary munition was not necessary for military purposes. Analysis of fires resulting from aerial bombardment however showed that only an insignificant percentage could be traced to explosives. Although an exploding bomb generated extremely high temperatures (well over 3000° Centigrade) this heat was dissipated in a fraction of a second. The explosive bomb was therefore an ineffective incendiary, notwithstanding the high temperature it generated, because the duration of its heat was quite inadequate. Actually an explosive was only a reliable fire producer when detonation occurred in the presence of liquids or gases having a high flash point.

Of the militarily acceptable incendiary materials, the one producing the best combination of (a) intense heat and (b) duration of burning, was magnesium. A 1-lb. magnesium tube (the essential feature of the incendiary bomb generally used in area bombing) would maintain a burning temperature in excess of 3000° Fahrenheit for approximately ten minutes. This was sufficient to ignite almost any material susceptible to incendiary action.

The core of the magnesium bomb was loaded with a mixture of flake aluminum and iron oxide (thermit). A firing pin, which functioned on impact, started a special firing mixture which fired the thermit charge, the burning thermit producing a temperature higher than the melting point of magnesium and thus igniting the bomb case. The thermit charge usually burned out in about 50 seconds and after the magnesium case became well ignited.

Thermit was also used as an independent incendiary agent. Temperature produced by the thermit bomb was slightly higher than the burning temperature of magnesium. However thermit reacted much faster so that its maximum temperature could not be sustained more than about 60 seconds; in this respect thermit compared unfavourably with magnesium as an incendiary. At the same time, thermit was effective against readily ignitable materials and its components were cheap.

White phosphorus was another inexpensive substance sometimes used for its incendiary properties. It is a relatively "cold" burner, is less generally efficient than magnesium, but possesses other important advantages. Since phosphorus will ignite spontaneously when exposed to air, it need not be detonated and so could be dropped in small quantities without warning, over large areas of field or forest that are ripe for burning. Or it might also be widely scattered by a burster, thus multiplying the chances of fire.

Solidified oils were likewise used as fillers for incendiary bombs, solid chunks of burning oil being thrown for considerable distances upon detonation. Here much of the latent heat of the filler was dissipated by radiation, although this loss was compensated for by the wide expanse of surface reached.

Thus there were two technical principles involved in the design of incendiary bombs, so that incendiaries might be classified either as (a) intensive type or (b) scatter type.

Intensive incendiaries were those that concentrated intense heat at a single point. They were needed for targets of relatively low inflammability, but they had to be dropped so as to burn within a few inches of ignitable materials. Scatter incendiaries on the other hand generated less intense heat at any one point but tended to fire any readily combustible materials that might be found in a wide area.

Man's long experience in combating fire was immediately drawn upon once the threat of incendiary warfare became real. Excessive destruction following early incendiary attacks resulted not so much from inability to cope with fires as from lack of understanding of the tremendous potentiality of the aerial bomber as a distributor of incendiaries. Once defense against incendiary warfare had become properly organized, it threatened to nullify the effectiveness of the incendiary bombs first employed. In the development of both tactics and technique of incendiary bombing, much thought accordingly was devoted to countercontrols, or measures intended to impede fire fighting on the ground.

Destruction of water mains by high explosive bombs and the use of antipersonnel bombs and even of machine guns against firefighters were common tactical measures to hamper fire prevention work.

In planning area bombing, the capability of fire-fighting organization on the ground was a definite factor in determining the quantity of bombs to be employed, the object being to start more fires than could effectively be combated.

Design of incendiary munitions was also modified from time to time in efforts to render extinguishment difficult or dangerous. An early instance was the introduction of sodium compounds which reacted violently on application of water.

Another interesting example was the addition of the "howler" tail to the 2-lb. magnesium bomb, intended to simulate the whine of a heavy bomb in flight, at the sound of which one ordinarily takes cover.

A small explosive charge in the base of magnesium bombs served as another but a not altogether effective deterrent to extinguishment.

A modification was the addition of a heavy explosive charge, equivalent to eight ounces of tetryl, so as to produce a combination magnesium incendiary and antipersonnel bomb, the unit weighing approximately 5 lb. This bomb, designed to kill or seriously maim anyone within 50 ft. of the burning incendiary, first appeared in 1942.

These technical innovations made the handling of some incendiaries extremely hazardous and necessitated expert training of fire wardens.

Fire defense against incendiary warfare was based primarily on defense against the threat of area bombing. It involved first, augmentation of appliance units as auxiliaries to professional fire-fighting organizations and second, utilization of amateur fire squads and individual fire watchers. The majority of small incendiary bombs that impacted on combustible structures could be controlled by 3- or 4-man fire squads provided with stirrup pumps and other simple equipment. A number however required service of appliance units equipped with pumpers; the latter were frequently required to handle fires resulting from larger scatter type incendiary bombs often used in point bombing.

Organization for civilian fire defense therefore presupposed handling of the largest possible number of incendiary bomb incidents by individuals and amateur fire squads, thus reserving pumper units for the small number of serious fires that might be expected from every sizable incendiary attack. The number of fire watchers and number of fire squads required for adequate fire protection against incendiary attacks in congested districts ran as high as 4,000 individuals per square mile.

During 1942 much progress was made in organizing and training civilian fire squads and auxiliary fire units in preparation for possible incendiary attacks. The National Office of Civilian Defense was instrumental in co-ordinating this development on a nation-wide scale and supplied standardized fire-fighting equipment to local communities. (G. J. B. F.)

War Information, Office of.

The Office of War Information, created by executive order on June 13, 1942, merged the U.S. information activities previously carried on by the Office of Facts and Figures, the Office of Government Reports, the Information Division of the Office for Emergency Management, and a portion of the Coordinator of Information's office. Elmer Davis, news analyst for the Columbia Broadcasting system, was named director of OWI on June 18. Milton S. Eisenhower, formerly director of the War Relocation authority, was appointed associate director of the office, and Archibald MacLeish, Librarian of Congress, was named assistant director in charge of policy development.

Under the terms of the president's directive, the Office of War Information was authorized primarily "to formulate and carry out . . . information activities designed to facilitate the development of an informed and intelligent understanding, at home and abroad, of the status and progress of the war effort and of the war policies, activities and aims of the government." The overseas operations branch in 1942 broadcast to the world from New York city and San Francisco and prepared publications and leaflets for neutral, enemy and allied countries everywhere outside Latin and South America. Within the United States, the domestic operations branch utilized every medium of information during the year—press, radio, movies, posters and publications—in an effort to tell the American people about the progress of the war, problems on the home front, the nature of the enemy, and the objectives of the United Nations.

War Labor Board, National.

The National War Labor board was established by executive order No. 9017 on Jan. 12, 1942, to succeed the National Defense Mediation board. Originally set up to effect the peaceful settlement of all U.S. labour disputes for the duration of World War II, the board was given added duties on Oct. 3, 1942, by executive order No. 9250, which provided that no increases or decreases in wage rates or in salary rates under $5,000, with certain exceptions, could be made without the board's approval. The board was set up as tripartite in composition, with four representatives of the public, four of labour, and four of industry.

In the first 11 months of 1942, the board received a total of 2,119 cases involving about 3,800,000 workers and closed 396 cases, involving approximately 2,067,000 workers. These figures exclude cases handled by the board's regional offices. Man-days of strike idleness in the first eleven months of 1942 never rose above 1/10 of 1% of man-days worked in war industries, and they averaged 7/100 of 1%. Total strikes in progress in war industries in the first 11 months of 1942 were 1,267, involving 521,230 workers, with 1,975,722 man-days idle.*

To dispose during wartime of the union security issue, the War Labor board developed a compromise maintenance of membership formula. This formula was so widely accepted by management and labour that versions of it were often included in voluntary agreements. The formula most frequently written by the board in 1942 provided that all employees of a company who were members of the union 15 days after the date of the board's directive order, or who later chose to become members, should remain in good standing for the duration of the company-union contract.

What later became known as the "Little Steel" formula was evolved by the board in deciding the request of the United Steelworkers of America, C.I.O., for a $1-a-day raise for the 157,000 employees of Bethlehem, Republic, Youngstown and Inland steel companies. The formula set a ceiling of 15% over the wage levels prevailing on Jan. 1, 1941. From that date to May 1942, shortly after the president's "cost of living" message to congress, the bureau of labor statistics' national cost-of-living index had risen 15%. The board announced that it would grant general wage increases only to groups of employees who had not received a 15% increase in their straight-time rates since Jan. 1, 1941. About two-thirds of all manufacturing industries had previously granted such increases in that period.

Out of a total of over 300 directive orders issued on dispute cases in 1942, only four refusals to comply were recorded. The Toledo, Peoria and Western railroad was taken over by the government in March 1942, when George P. McNear, president of the road, refused to accept a WLB decision that his dispute with two railway brotherhoods be settled by arbitration. The General Cable company plant at Bayonne, N.J., was taken over by the navy in Aug. 1942 because workers had been on a wildcat strike for three days, protesting the board's refusal of a wage increase requested by the International Brotherhood of Electrical Workers, A.F. of L. Within a week the plant was returned to private management. The S. A. Woods Machine company, Boston, was taken over by the army in Aug. 1942 when the company refused to comply with an order of maintenance of membership.

In Dec. 1942 Montgomery Ward & Co. refused to comply with a WLB order of compulsory arbitration and maintenance of membership, but said it would obey if directed to do so by the president of the United States. After the president directed the company to comply with the board order, however, the company attempted to insert into the union contract a statement that the document was being signed by the company "under duress." A further order from the president was required before the company signed the contract as originally ordered, with the addition of a statement of protest.

In all other cases, both parties recognized the board's wartime functions as final arbiter of labour disputes. (*See* also LAW; NATIONAL LABOR RELATIONS BOARD.) (W. H. Ds.)

War Manpower Commission. The War Manpower commission was created in the Office for Emergency Management by executive order of President Franklin D. Roosevelt on April 18, 1942, "for the purpose of assuring the most effective mobilization and utilization of the national manpower." Paul V. McNutt, federal security administrator, was appointed chairman. By further executive order of Dec. 5, 1942, the functions of the commission were extended.

The chairman of the War Manpower commission, with the advice of and after consultation with the members of the commission, was empowered to formulate over-all manpower policy and programs, direct the administration of the Selective Service system, a national system of placement services, and programs for the training and effective utilization of manpower, and co-ordinate the action of all government agencies concerned with manpower problems.

A deputy chairman was appointed to act for the chairman and advise him regarding relationships with representatives of workers and employers, other governmental agencies and public groups. The Management-Labor Policy committee, composed of equal representation for management and labour, was to consult with the chairman on matters of policy and programs.

The president's Committee on Fair Employment Practices, through the office of the executive director, was made responsible

MANPOWER NEEDS FOR THE WAR
NONESSENTIAL BUREAUS & AGENCIES
KNOX

A REMEDY for the U.S. manpower shortage of 1942, suggested by Knox of the Memphis *Commercial Appeal:* "Reduce a Little, and Then Look Around" to the chairman for carrying out the provisions of President Roosevelt's executive order of June 25, 1941, which reaffirmed "the policy of the United States that there shall be no discrimination in the employment of workers in defense industries or government because of race, creed, color, or national origin." The Women's Advisory committee was organized to consider and recommend to the chairman on matters of policy, particularly as they affected women and the contribution women could make in the successful prosecution of the war.

---

*These figures are gathered monthly by a committee of representatives of the war, navy and labour departments, the War Production board, the Maritime commission and the War Labor board.

The executive director was appointed to assist the chairman in the organization, general direction and supervision of the staff of the commission, and in the execution of policies and direction of programs. The following five bureaus were placed under the general direction of the executive director:

The bureau of program planning and review, to formulate over-all manpower policies and programs and be responsible for all reports and research, and compilation and release of labour market data. It was charged with co-ordinating the statistical activities of the commission and maintaining technical consulting service.

The bureau of selective service, including the Selective Service system, to be responsible for the administration of the Selective Training and Service act.

The bureau of placement services, including the United States employment service, to be responsible for handling employment for industry, agriculture and the government, and for placement of professional and scientific manpower. More than 8,000,000 jobs were filled through the employment service in 1942.

The bureau of training services, to develop unified programs and policies to meet training needs of wartime employment and obtain the most effective utilization of training resources.

The bureau of manpower utilization, to develop programs and policies to obtain maximum utilization of manpower by industry, agriculture and government.

Also under the general supervision of the executive director were placed 12 regional manpower directors, each of whom was made responsible for co-ordinating the activities of the Selective Service system with other activities of the commission, and conducting all other commission programs within a region. Area manpower directors, about 60 of whom were in operation at the end of 1942, were responsible for the formulation and effectuation of a manpower program within a designated area. War Production, U.S.

Early in 1942, under the impetus of many months of defense production experience, U.S. industry hit its stride in the titanic task of arming itself quickly for the war into which the United States had been hurled by Japan's surprise attack at Pearl Harbor and at the same time of providing its allies with all possible munitions and subsistence supplies.

Initial steps toward conversion from the production of goods for civilian consumption to the manufacture of a great variety of implements of war had been taken in the United States before the nation found itself among the belligerents. During the previous year (1941), much of the inevitable confusion attendant upon an uncharted course involving such a huge enterprise had been encountered and, to a degree, overcome. But when 1942 dawned there were still great loopholes in the production set-up and seemingly endless wrangling among government officials, industrial managers (both large and small), and labour leaders. Public criticism had been directed at the war and navy departments, the Office of Production Management, and Supply Priorities and Allocation board; in fact, at many other harassed branches of the government, as well as business management and labour.

As the clamour for the appointment of a single administrator with absolute control over the arms production program reached a climax, President Roosevelt, by executive order, on Jan. 16, 1942, established the War Production board (*q.v.*), to supersede the Office of Production Management and to take over the functions of the Supply Priorities and Production board, which was abolished by the president's order. Donald M. Nelson, who had been drafted from industry in 1940 to help set up the production machinery of the government, was appointed chairman of WPB and was given supreme authority to assure "maximum production and procurement for war," in the words of the president. It was imperative that every possible manufacturing facility, every ounce of available manpower, should be mobilized in the most effective manner to place more ships on the seas, more planes in the air, more tanks and guns and munitions of all kinds in the hands of the United Nations' fighting forces everywhere.

How well the war production job of 1942 had been performed was proclaimed by President Roosevelt on Jan. 7, 1943, in his message to congress on the state of the union. Asserting that the arsenal of democracy was "making good," the president declared: "We produced about 48,000 military planes—more than the aeroplane production of Germany, Italy and Japan put together. In Dec. 1942 we produced 5,500 military planes, and the rate was rapidly rising." Other production figures for 1942 reported by President Roosevelt were: 8,090,000 tons of merchant shipping; 56,000 combat vehicles, such as tanks and self-propelled artillery; 670,000 machine guns and 21,000 anti-tank guns, both six times greater than 1941 production; 10,250,000,000 rounds of small arms ammunition, five times greater than in 1941; and 181,000,000 rounds of artillery ammunition, 12 times the size of the 1941 output and 10 times greater than the total production of the

United States in World War I. Construction of war vessels and cargo ships in the United States during 1942 far exceeded expectations at the beginning of the year.

In early Feb. 1942 the WPB issued an order which loosed the might of America's greatest industry against the foreign foes; production of automobiles was stopped, and the industry which had produced 5,000,000 cars and trucks in a year set its manpower and inventive genius to work tooling up for tanks, planes, guns and other weapons. In quick succession came limitation orders to insure that steel, copper, aluminum and a score of other materials went into war goods, and that industry went to work as never before producing them. Within a few months the great consumer goods industries were virtually shut down, as such, for the duration. Instead of civilian durable goods, these plants in most instances turned to the production of vital war materials.

As early as May it had become apparent that the tremendous program of new plant construction started around the first of the year was doomed because the nation would not be able to produce enough steel to carry out the extravagant building program and at the same time keep the plants already equipped in full operation. The new building program was cancelled. The steel that would have gone into auxiliary plants and machinery to produce munitions in 1943 and 1944 was allocated at once to the manufacture of immediately needed war implements. Notwithstanding the heavy demands for building materials and labour—and for millions of fighting men—scores of huge war plants for loading shells, making powder and other similar purposes, were erected at strategic locations throughout the country. Most of them are owned by the federal government.

Free Private Enterprise.—The ingenuity of U.S. industry (free private enterprise, sustained by more than 15,000,000 thrifty citizen investors), faced as it was with a sudden demand for mass production of war munitions on an undreamed-of scale, provided inspiration for one of the proudest chapters in American economic history. Literally thousands of timesaving, laboursaving, and moneysaving devices were developed in industry's research laboratories or among the workers in the factories.

The 1942 construction program within the United States totalled some $13,000,000,000, the greatest in history. Deliveries of machinery and equipment added another $3,500,000,000. Altogether, about 70,000 prime contracts and 700,000 subcontracts were let during 1942.

The profit motive, a dominant influence in traditional U.S. industry, was largely cast aside in the race for production for victory. Ability to produce in huge volume and with the utmost speed was the prime consideration in the placing of contracts. Where excessive profits might result from production of war goods, the contract renegotiation provision of the Federal tax law and the excess profits tax were expected to provide a means of equitable adjustment.

The smaller industrial plants and small industry in general were the principal sufferers from the new era of high speed war production, but attempts were made from time to time to relieve this situation. Through the contracts distribution branch of the production division of WPB special effort was made to induce prime contractors to do more subcontracting and, from Feb. to June 1942, approximately 15,000 subcontracts valued at over $522,000,000 were negotiated.

Labour.—The loyal response of organized labour to the unprecedented demands for concentration upon the world's greatest production job was demonstrated by many outstanding instances

DAY SHIFT of the Douglas Aircraft plant at Long Beach, Calif. An estimated 350,000 persons were at work in southern California war industries in 1942—more than double the number employed in 1940 and an impressive array of facts and figures. Production records were broken in practically every category of war materials. The battleship "New Jersey," for example, was built 18 months ahead of schedule. Bombers, fighters and tanks were assembled in the United States faster than ever before anywhere in the world. The war production labour force grew from 6,900,000 in 1941 to more than 17,500,000 in 1942.

Organized labour relinquished the strike as a weapon for the duration of the war, but on the other hand was protected by federal legislation and administrative rulings with regard to hours, wages and working conditions. Nevertheless, as the year approached its close, the scarcity of manpower became an increasingly serious problem. The War Manpower commission (*q.v.*) was established in April 1942, with Paul V. McNutt as chairman, and at that time WPB's labour production division became an agency to represent labour within the WPB rather than an agency to handle labour supply problems for the government. Participation in the consideration of important policies was accorded representatives of A.F. of L. and C.I.O.

Labour-management committees were established in co-operation with the War Production Drive headquarters (located in Chairman Nelson's executive office) to insure the most effective utilization of production facilities, raw materials and manpower. Valuable production ideas, ways to save time or materials, and reduction in absenteeism resulted from the work of these committees. On Dec. 5 President Roosevelt centralized responsibility for manning the armed forces, industry and agriculture in the hands of War Manpower Commissioner McNutt.

Scrap Conservation.—The magnitude of the role assumed by the United States as "the arsenal of democracy" was emphasized in 1942 by the growing shortage of vital commodities, including so-called substitutes, in a hemisphere which had generally been regarded as independently rich in raw material of every description. More steel, copper and aluminum were being produced than ever before, but not enough. America learned, for example, that it couldn't get all the synthetic rubber it wanted because among other things a lot of copper was required to build a synthetic rubber plant. Copper was short. Steel was short. Aluminum was short. Rubber and silk were short, and all the good substitutes for them were short.

"TANK TRAPS" of 1942, as viewed by Bishop of the *St. Louis Star-Times*

The scrap campaigns and other conservation measures alleviated the situation as the American people gathered up waste rubber, metals and other useful commodities that had been discarded in attics, cellars or farm yards. Newspaper publishers throughout the nation responded effectively to a call from Chairman Nelson of WPB for a whirlwind campaign for the collection of scrap metal. By November more than 5,000,000 additional tons of scrap metal were collected and the steel mills were assured enough to see them through the winter.

Other salvage drives produced similarly satisfactory results. President Roosevelt's scrap rubber drive in June netted 450,000 long tons of scrap rubber. The scrap rubber inventory at the end of October was 583,000 long tons, not to mention the tremendous number of automobile tire casings and tubes turned in around Dec. 1. In October detinning plants received 12,000 tons of reclaimed tin cans, while returned collapsible tubes that had once held shaving cream or tooth paste yielded almost 80 tons of tin in the same month.

Reorganization of the War Production Board.—Another crisis in the supreme effort of the combined forces of government and industry to maintain an ever-expanding volume of production impended during the late summer of 1942 through an understandable difference in the points of view of the various agencies and officials involved in the over-all construction problem. The almost constant argument over the allocation of raw materials and the status of production for civilian use between the army and navy on the one hand and the WPB and other agencies on the other hand, reached a near-breaking point in September. A major change in the administration's production policy was widely predicted. The change that finally did take place came in the form of a constructive reorganization of the War Production board by Chairman Donald Nelson. Industry was given a more comprehensive role in the production picture through the appointment of Charles E. Wilson, president of General Electric company, as a vice-chairman of WPB, and the army and navy liaison was improved through appointment of Ferdinand Eberstadt as another vice-chairman of WPB. Eberstadt brought to WPB valuable experience gained as chairman of the army and navy munitions board. Wilson was placed at the head of the new Production Executive committee (formed to set up production schedules and follow them through) in association with Lieut. Gen. Brehon B. Somervell and Maj. Gen. Oliver P. Echols of the army, Vice-Admiral Samuel M. Robinson of the navy and Rear Admiral Howard L. Vickery of the maritime commission. Numerous other personnel changes followed this reorganization, one being the acceptance by Hiland G. Batcheller, president of Allegheny-Ludlum Steel corporation, of the difficult task of heading the iron and steel branch of war production. These changes left Chairman Nelson more time to devote to the over-all job of co-ordinating war production in all its phases.

Balanced Production.—One of the lessons learned in the vigorous U.S. war production drive of 1942 was the lesson of a balanced manufacturing program. It was evident as the production program got under full headway that it was going faster in some directions than in others; that it would be necessary to curtail factory output in some portions of the over-all production until the manufacture of component parts could catch up. It became possible late in 1942 to get a firmer and clearer grasp on the long-range program. It was realized that a program of the magnitude conceived must provide munitions needed by all the armed forces, and just as importantly it must provide for the goods and services to maintain a sound, healthy civilian economy. The over-all program was divided into a number of major components, each balanced within itself and with the others. There were the programs of the army, navy, aircraft, maritime commission, Office of Civilian Supply, Board of Economic Warfare, and Office of Lend-Lease Administration, and other agencies, each of the agencies being responsible for its part in the over-all, long-range program.

The difficult problem of achieving maximum sustained production was met by the War Production board's plan to help get every plant on an approved schedule with a precisely balanced over-all program. Materials and other resources had to be budgeted and allocated to produce the greatest possible amount of the particular things needed most by the United Nations at any given time. Results of the production requirements plan, set up as a means of allocating materials on the basis of the quarterly needs of the various manufacturers, proved unsatisfactory, principally because it did not compel that the total program would be kept within materials supply and the ability to produce and because it didn't make sure that some components would not be manufactured at the expense of others.

Controlled Materials Plan.—The War Production board, with the co-operation and advice of the armed services and other government procurement agencies and with the counsel of management and labour, worked out a new system to control and implement production in an economy of scarcity. This system, the controlled materials plan, was announced early in Nov. 1942. Under this plan, the WPB began dividing available steel, copper and aluminum among the government agencies responsible for filling the essential military and civilian needs of the United States and the other United Nations. Each agency, in turn, cut its programs to fit its share of materials and divided the steel, copper and aluminum allotted to it among its manufacturers. Thus, each manufacturer was assured of just enough material, when he needed it, to produce precisely what was expected of him. The controlled materials plan was put into effect gradually, with a view of reaching total application by July 1, 1943, when it was expected to become the only system under which controlled materials were to be allotted.

Steel and Alloys.—As facilities for the manufacture of war munitions rapidly expanded during 1942, shortage of raw materials became more acute. The steel industry, which operated at above 90% capacity for more than two years, was operating at more than 97% capacity at the close of 1942. By October three out of every four tons of the more than 5,000,000 tons of finished steel produced each month were going into direct war use, and the remainder was diverted to such essential purposes as railroads, machinery manufacture, and construction.

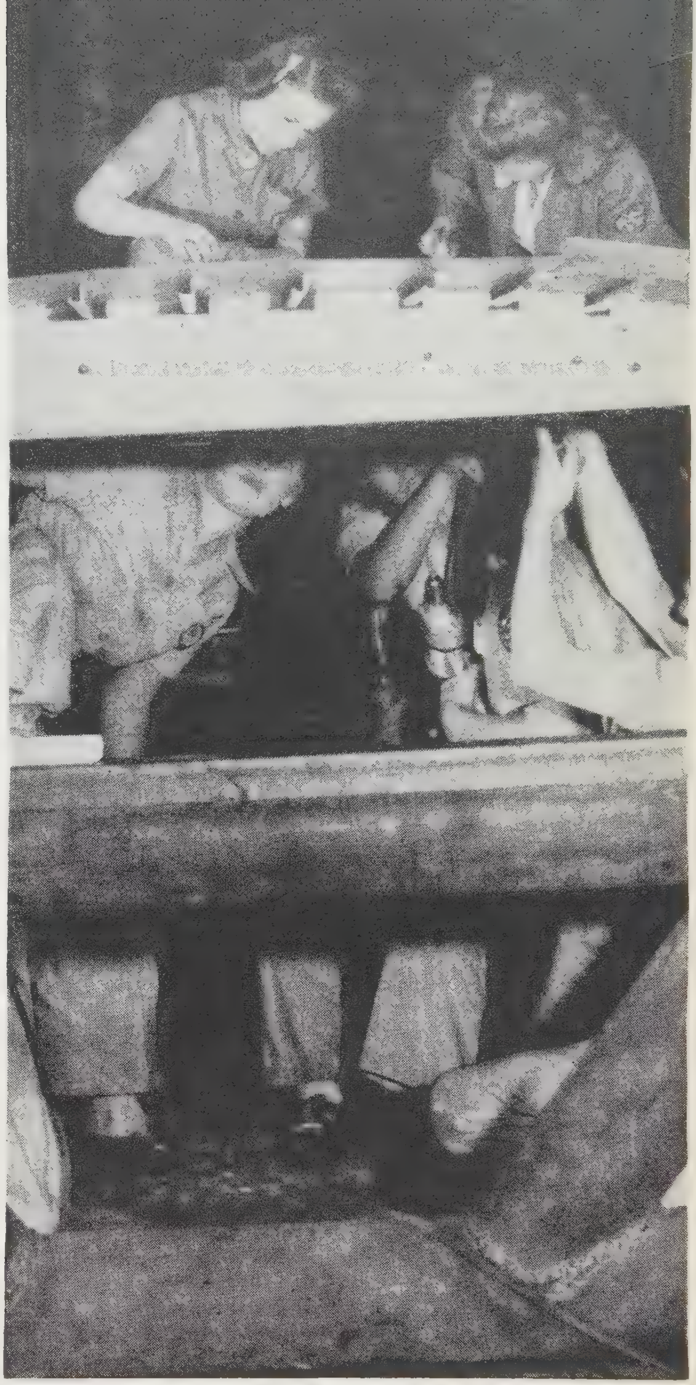
In terms of plates and shapes, sheets, bars, pipe, wire, rails and the like, the United States in 1942 turned out about 62,000,000 tons, or slightly more than 70% of the total of 86,000,000 ingot tons the nation produced. The remaining 30% went back into the furnaces in the form of scrap.

The growth of ingot production was shown by the following comparisons:

	Net tons
1939	52,798,714
1940	66,982,686
1941	82,927,557
1942	86,000,000*

*Estimated

To make such increased production possible, rated steelmaking capacity, as distinct from actual production, was stepped up correspondingly. By the end of 1942 rated steelmaking capacity approached 93,000,000 tons, compared with 88,000,000 tons at the end of 1941, 84,000,000 tons for 1940, and 81,000,000 tons for 1939. Predictions were that the rated capacity would reach 98,000,000 tons by the middle of 1943.



GIRL AIRCRAFT WORKERS assembling the belly section of a transport plane at Ft. Worth, Tex. By the latter part of 1942, women were earning an estimated third of the U.S. national income

Among the major steps undertaken by WPB to fit essential requirements for alloy steel to the supply was the development of national emergency alloy steels. These NE steels used manganese and silicon to produce steels with qualities comparable to more highly-alloyed steels. Progress also was made in expansion of production and imports. The problem of alloy steel supply was complicated by the fact that of the six alloying metals—nickel, chromium, manganese, tungsten, vanadium and molybdenum—all but molybdenum were produced principally outside the United States.

In 1936, when the United States used 324,258 tons of chromite ore, all but 269 tons were imported from Africa, Cuba, the Philippines and Turkey. By 1940, when war had spread widely, consumption doubled over 1936 and imports increased ten times. But domestic production was still only 2,666 tons out of the total supply of 657,689 tons. Government experts estimated late in 1942 that to meet military and essential civilian requirements in 1943, about three times the tonnage used in 1939 would be required, even with civilian needs cut to something like 3% of the former total.

The Reconstruction Finance corporation made $10,000,000 available for the furtherance of chromium projects in the United States, and private enterprise added several million dollars more, in order to assure a domestic output in 1943 as large as imports in prewar years. Large low-grade deposits of chromite ore were developed in Montana, California and Oregon.

Although the United States produced more than 85% of the world's supply of molybdenum, the heavy demand for this alloying material as a substitute for tungsten, chromium and nickel soon exhausted the surplus production and created a scarcity of molybdenum also. As a result of steps taken in 1942 to increase domestic output, the 1943 production of molybdenum was expected to be increased by at least 15%.

Production of tungsten in Latin American countries was stimulated in 1942 through U.S. government action and development projects were started in the United States—in California in particular. The 1942 supply was 10% short of demand.

Imports of vanadium into the United States in 1942 fell below 1940, but domestic production was the highest on record. Government financial aid was extended to mines whose ore was so low grade that it could not be extracted at current prices.

Only negligible amounts of nickel were obtainable in the United States in 1942—2,000 to 3,000 tons of secondary metal recovered from scrap, and about 500 tons of primary metal as a byproduct of electrolytic refining of copper. Essential demand for nickel in 1942 ran some four times that of 1938. In the hope of increasing imports from Cuba, the RFC aided a United States corporation to the extent of $20,000,000 to finance an experiment in treating low-grade Cuban ores by a special process.

Remarkable success was achieved in 1942 in the expansion of domestic output of manganese in the United States. This metal was absolutely essential in steel production, and by careful planning the United States stockpile at the end of 1942 contained enough for at least two years' supply, aside from expected additions from domestic output and imports.

Copper.—A striking illustration of the dislocation that may occur in war production through unexpected labour shortage was witnessed during 1942 in the copper mining industry. A labour shortage had been growing, and so bad did it get that more than 5,000 tons of copper a month were lost in July and August because miners had dropped their tools and taken higher-paying jobs in shipyards, aircraft plants and other construction projects or gone off to the armed forces. As an emergency measure, 4,000 soldiers with mining experience were furloughed to work in the copper mines. United States copper supply reached an all-time high in 1942 of nearly 3,000,000 tons, yet production in many munitions plants was interrupted because copper was not readily available. A premium payment plan to stimulate production of marginal ores was developed by WPB, OPA and Metals Reserve company to pay 5 cents a pound above the prevailing price of 12 cents for all production over certain quotas. Many mines were worked 168 hours a week. Scrap collection was the most important source of metal, resulting in nearly 600,000 tons added to the U.S. supply of copper during 1942.

Zinc.—The zinc supply became a source of deep concern in the latter half of 1942. After trimming nonessential use to a minimum, two problems had to be solved—developing new sources of ore and expanding milling, smelting and refining capacity. Forty-eight projects recommended by the zinc division of WPB were put into construction. These projects included development and exploitation of new ore deposits, opening new mines, mills, smelters and refineries. One new smelter was completed in 1942, and four electrolytic refineries with an annual capacity of 216,000 tons were put into operation. To encourage production of marginal ores, premium prices of 2¾ cents a pound over regular prices were paid for all production over quota. Imports were also stepped up considerably.

Tin.—With the far east producing 70% of the world supply of tin, the flow of this indispensable metal to America was cut off abruptly with the spread of the war. The year's most hopeful development in the tin field was the completion of the Longhorn tin smelter in Texas, with a capacity to handle all the tin ore currently available to the United Nations. Efforts to recover tin from cans, which normally took half the supply, gave promise of yielding more than 5,000 tons of tin a year. Also great hopes were placed in the expansion of electrolytic tin-plate manufacturing facilities.

Aluminum.—One of the most satisfying situations in America's storehouse of war materials was provided by aluminum. At the end of 1942, the rate of supply was about 2,300,000,000 lb. a year, with facilities nearing completion to bring the 1943 production rate up to 3,000,000,000 lb. a year. Of the 1942 total, 230,000,000 lb. came from Canada. An important development of 1942 in aluminum production was the conversion of plants to low-grade domestic bauxite and the construction of new plants to use the low-grade ore. It was confidently expected that the United States would be completely independent of foreign-ore imports by May of 1943 and by September would be able to supply Canada's bauxite needs as well. During 1942 eight new ingot aluminum producing plants came into operation with a total rated capacity of more than 1,000,000,000 lb.

Magnesium.—Large-scale production of magnesium was carried on in the United States for the first time in 1942. This metallic element became an important partner of aluminum in aircraft manufacture. At the close of 1942, production was at the rate of 260,000,000 lb. a year, and a program to raise United States production to over 600,000,000 lb. a year was well under way Eight plants with a rated capacity of 324,000,000 lb. a year came into production in 1942. The outstanding technological development of the year in magnesium was the ferro-silicon process for extracting magnesium in commercial volume. Under this process, less electric power was required, and construction of the plants took less critical materials than other types.

Lead.—To the end of building a stockpile of lead to take care of all contingencies, production was pressed during 1942, with premium payments of 2¾ cents a pound above the regular price for all production over quota. The favourable lead outlook late in 1942 brought a slight easing of restrictions on use of lead in building and other products in November. United States supply of lead at the end of 1942 was at the rate of 1,308,000 tons a year. About 350,000 tons of this lead were recovered from scrap.

Rubber.—The biggest "fly-in-the-ointment" in the United States during the first year of the war—at least so far as disturbing the equilibrium of the public mind—was the rapidly dwindling rubber stockpile of the nation and the certainty of not being able to get much new rubber for at least two or three years. The overrunning by the Japanese, almost at the outbreak of hostilities in the Pacific regions, of 90% of the world's rubber supply precipitated a rubber crisis for the United Nations, and wrote finis to the pleasure-driving programs of millions of American families. With less than one year's supply of rubber on hand in the United States and synthetic production almost negligible, the government sought to find the best remedies for the situation.

The synthetic rubber program was expanded, with the goal set for more than 400,000 tons in 1943 and still greater capacity later. The sale of new tires, except on strict rationing basis, was stopped Jan. 5, 1942, and recapping was restricted Feb. 19. On May 2 the Office of Defense Transportation (*q.v.*) was given authority over all rubber-borne transportation, and ten days later gasoline rationing began on the eastern seaboard—both as a gasoline and rubber-saving measure. There followed a period of public confusion on the subject of rubber, aggravated by the suggestions of a multitude of pseudo-experts and the conflicting opinions of those in possession of facts. Faced with both problem and confusion, the president appointed a rubber survey committee composed of Chairman Bernard M. Baruch, Dr. James B. Conant and Dr. Karl T. Compton to assemble the facts, study them, and report. On Sept. 10, the Baruch committee laid down a comprehensive program designed to carry the nation through the rubber shortage. The report stressed both rubber conservation and increased synthetic production. To bring about the former, the committee called for nation-wide gasoline rationing (tire mileage rationing), 35-mi. speed limit, periodic tire inspections, and a program to maintain essential civilian driving for the duration. The committee further recommended expansion of the projected synthetic program to 1,100,000 tons annually, as well as of reclaiming facilities and scrap collection, and urged the appointment by the chairman of the War Production board of a rubber administrator with full authority to carry out the recommended program. A week later the president created the Office of Rubber Director in WPB, and Donald M. Nelson appointed William M. Jeffers director. The conservation measures recommended by the Baruch committee, to make the 1,000,000 tons of rubber then on automobile tires last as long as possible, were put into effect. On Dec. 1 nation-wide mileage rationing was instituted. (M. P. Q.)

War Production Board.

Keeping pace with the remarkably swift industrial and economic developments in the U.S. war effort, the War Production board, which was established by President Roosevelt on Jan. 16, 1942, adjusted its organizational make-up and personnel as occasion required during 1942 to fit changing conditions. Chairman Donald M. Nelson, who was charged by the president with responsibility for giving the nation "the most effective prosecution of war procurement and war production," remained at the helm throughout the year in supreme control of all the policies and operations of the board.

In the last and most thorough reorganization of the year, early in the fall, Chairman Nelson announced the addition of new blood and ability to the imposing group of officials already functioning on this important government body. The organizational structure was radically changed to meet the need for co-ordination that would assure to each governmental agency and each industry engaged in providing the war necessities of the United States and its Allies everything needed to operate on a definite schedule within a precisely balanced over-all program.

As constituted during the final months of 1942, the War Production board's principal offices, bureaus and divisions were divided into three spheres, namely: (1) the chairman and general staff agencies, (2) the office of production vice chairman and (3) the office of program vice chairman. Heading these spheres were Chairman Nelson and his *alter ego,* Vice Chairman W. L. Batt. Vice Chairman J. S. Knowlson represented Mr. Nelson on the combined Production and Resources board. The office of rubber director was established within the WPB by order of the president, and Chairman Nelson appointed as rubber director, William M. Jeffers, president of the Union Pacific railroad, with full authority over the rubber program. There were a number of other divisions directly under the chairman, such as the office of civilian supply and the Labor Production division.

The office of production vice chairman was filled by appointment of Charles E. Wilson, president of General Electric company, to supervise the scheduling of programs. With him were associated such men as Lieut. Gen. B. B. Somervell of the army, Major Gen. O. P. Echols of the army air force, Vice Admiral S. M. Robinson of the navy, Rear Admiral H. L. Vickery of the maritime commission, Ferdinand Eberstadt, Lieut. Gen. William Knudsen, Rear Admiral R. A. Davidson and others.

The office of program vice chairman was headed in 1942 by Ferdinand Eberstadt, former chairman of the Army and Navy Munitions board. The functions of this office were to co-ordinate programs and effect distribution and allocation of materials and other resources to meet such programs. Mr. Eberstadt was also appointed chairman of the requirements committee, membership of which included John F. Fennelly as vice chairman, Brig. Gen. L. C. Clay, Rear Admiral Henry Williams, Lieut. Col. W. F. Rockwell, Brig. Gen. B. E. Meyers, and others. The director general for operations, Ernest Kanzler, reported to the program vice chairman, and under the director general were various operating bureaus and divisions, covering a wide range of materials and industries. Mr. Eberstadt appointed Donald D. Davis, president of General Mills, to head his program co-ordination division.

The new set-up of the War Production board, which implemented the new Controlled Materials plan, was designed not only to bring allocation and supply into balance as rapidly as possible, but to establish more intimate relationship between WPB and industry.

With the establishment of the War Production board in Jan. 1942, the Office of Production Management and the Supply Priorities and Allocations board passed out of existence. The functions of those boards were transferred to WPB. (*See* also HOUSING; PRIORITIES AND ALLOCATIONS; PRODUCTION RESEARCH AND DEVELOPMENT, OFFICE OF; WAR PRODUCTION, U.S.)

(M. P. Q.)

War Relief Contributions.

The year 1942 saw increased U.S. governmental participation in foreign war relief work, a field which formerly had been left, in large part, to private agencies.

In July 1942, under executive order No. 9205, the supervision of private relief organizations was transferred from the department of state to the President's War Relief Control board (formerly President's Committee on War Relief agencies), and the board's supervisory scope was enlarged to include all organizations (except the American Red Cross) engaged in collecting contributions for war relief, both in the United States and elsewhere. Registered organizations, numbering 190 at the end of the year, raised a total of $35,382,189.12, $28,533,960.98 in cash and $6,848,228.14 as the value of goods in kind. $21,482,412.69 in cash was transmitted abroad and goods in kind valued at $5,989,707.60 were shipped. The chief beneficiaries of privately financed relief operations were Great Britain, China and the soviet union. The above-mentioned totals do not include the value of shipments of food, medicines and clothing sent to these countries through the Lend-Lease administration (*q.v.*) and the American Red Cross.

The joint Anglo-U.S. blockade directed against the axis powers prevented, as had been the case since the beginning of World War II, the carrying on of large-scale relief projects in axis-occupied countries during 1942. With the appointment of former-

Governor Herbert H. Lehman as Director of Foreign Relief and Rehabilitation Operations, announcement was made that relief operations would begin as soon as the invaders were driven from these areas.

The United States and Great Britain found it possible, however, to make an exception to the above-mentioned policy in the case of Greece. Through the good offices of the Swedish government, an agreement was reached with the German and Italian governments whereby they agreed to refrain from further requisitioning of native produce and to permit the distribution to the Greek people of foodstuffs imported through the blockade, such distribution to be supervised by a commission composed of Swiss and Swedish nationals. Shipment of grain from Canada began in the autumn, supplemented later with dried vegetables from the United States. Substantial quantities of medicines also were sent to Greece.

Relief of U.S. Prisoners.—With the outbreak of war with Japan, U.S. citizens in the Philippine Islands and elsewhere in the far east were taken into custody by the Japanese, and some U.S. soldiers were taken prisoner. While, under the Geneva Prisoner of War convention of 1929 which Japan had agreed to observe and to apply to civilian internees as well as to prisoners of war, the provisioning and humane treatment of prisoners by the detaining power was provided for, differences in dietary habits and standards of living prompted friends and relatives to endeavour to send to the far east supplementary supplies, a procedure recognized and provided for in the convention. Determined and continued efforts through governmental and International Red Cross channels had failed in 1942 to obtain Japanese safe conduct for the shipment of supplies to the far east. Supplies furnished by the American Red Cross and the war and navy departments were, however, sent on the ships engaged in the exchange of nationals between Japan and the United States. (*See* also PRISONERS OF WAR; RED CROSS; RELIEF.) (E. D. K.)

Warren, Joseph (1876–1942), U.S. educator, was born March 16 in Boston. He received his law degree from Harvard in 1900 and practised law until 1907, when he became administrative assistant at Harvard university. Prof. Warren joined the Harvard law faculty in 1913 and was professor from 1913 until his retirement in 1942; during the last 15 years of his life he held the chair of Weld professor of law. Prof. Warren published *Cases on Wills and Administration* (1917) and *Cases on Conveyances* (1922). He died in Boston, Sept. 19.

Washington. A state in the extreme northwest United States, popularly known as the "Evergreen state," admitted to the union Nov. 11, 1889. Area, 68,192 sq.mi.; pop. (1940) 1,736,191; native, 1,525,812; foreign born, 210,379. Capital, Olympia (13,254). The three largest cities are Seattle (368,302); Spokane (122,001); and Tacoma (109,408). The urban population in 1940 was 921,969 or 53.1%.

History.—In line with the general U.S. trend toward Republicanism, three of the six congressional districts of Washington, formerly all Democratic, elected G.O.P. candidates in Nov. 1942. The perennial 40-mill limit on the taxation of real property and a measure to increase the benefits of industrial insurance were adopted by popular referendum. The supreme court sustained the state law designed to curb chain-dentistry.

Education.—During the school year 1941–42, average daily attendance in elementary and secondary schools was 266,929; the number of teachers was 11,658. Total current expenditures were $32,845,972.53, and the cost per pupil in daily attendance was $123.05. Salaries of teachers, exclusive of superintendents, averaged $1,756.20.

Public Welfare, Charities, Correction.—The total amount spent upon public assistance in the state, including federal direct expenditures and state aid, was $39,831,000 for the year Aug. 1941 to July 1942. An average number of 7,441 cases on relief received subsidies totalling $1,854,000. The average number of persons on WPA was 8,836, and the total expenditure was $8,241,000. Old persons averaging 62,985 in number received a total of $25,097,000. An average of 12,387 dependent children received a total of $2,536,000. An average number of 1,027 blind people received aid totalling $436,000. In 1942 there were 11 state charitable institutions with a total of 9,068 patients, and four correctional institutions with 2,442 inmates.

Communication.—On Dec. 31, 1940 there were 6,297 mi. of highways in the state. During 1940, $39,925,000 was spent on highways. Railroad mileage was 5,268 mi. and water-borne commerce amounted to 2,531,909 tons in 1940.

Banking and Finance.—State revenue receipts for the fiscal year 1942 were $147,801,987.83; expenditures, $130,012,267.21. On Nov. 30, 1942, surplus funds amounted to $41,217,804.21, of which $20,203,768.46 was invested in government bonds, and $21,014,035.75 cash balance. The bonded indebtedness at the end of 1942 was $9,450,000. One hundred and thirty-five banks in the state reported a total capital of $30,121,000; capital surpluses and undivided profits of $54,879,000; deposits of $855,093,000; and resources of $920,855,000.

Agriculture.—In 1940, 66 farm crops totalling $95,416,000 in value were grown on 3,547,800 ac. Income from crops in 1941 was $123,946,000; from livestock $98,095,000; from government payments $5,665,000.

Leading Agricultural Products of Washington, 1942 and 1941

Crop	1942 (est)	1941
Wheat, bu.	53,083,000	61,142,000
Apples, bu.	27,552,000	27,000,000
Hay (wild and tame), tons	1,984,000	1,969,000
Potatoes, bu.	8,610,000	8,400,000
Barley, bu	12,560,000	5,402,000
Pears, bu.	6,723,000	6,954,000
Peas, (100 lb. bags)	4,150,000	1,950,000
Oats, bu.	10,944,000	7,605,000

Manufacturing.—In 1939 the total value of manufactured products was $636,649,809; 101,136 salaried persons and wage earners received a total of $143,412,064. Shipbuilding and aeroplane construction possibly equalled or exceeded lumber and sawmill products as the state's leading industry in 1942.

Mineral Production.—Mining statistics were a military secret in 1942, but production probably exceeded the 1941 figure of $31,590,023, a post-depression high. Copper and zinc were exploited to the very limit. Four aluminum ingot plants and an aluminum rolling mill constituted the basis for the state's new light metal industry. (H. J. DE.)

Washington, DISTRICT OF COLUMBIA, national capital of the U.S.A., and 11th largest of U.S. cities, with a population of 663,091 by federal census of 1940, had increased its population to an estimated 865,000 at the end of 1942, when the total federal employment amounted to 280,000, 150% more than the peak at the end of World War I.

World War II changed the appearance of the city in 1942. The Mall, Potomac park and many vacant plots of ground were covered with temporary office buildings. The federal government also rented many private office buildings and converted some apartment houses to office use. The principal permanent public building completed in 1942 was the huge Pentagon building for the war department, located in Arlington county in territory once a part of the District of Columbia but in 1846 returned by congress to the state of Virginia. The building was constructed to accommodate nearly 40,000 employees. The president directed that it be converted after the war for quartermaster stores and government files. The bureau of public roads constructed an elaborate system of approach roads with 22 grade separations to avoid all grade crossings.

It was expected by the National Capital Park and Planning commission that after the war all permanent public buildings would be located according to the well considered official plan.

Between July 1941 and Nov. 1942 priorities were given to private companies for building 31,823 family units. Up to June 1942 these were coming on the market at the rate of 500 a month, and after that date at the rate of 1,000 a month. In all it was estimated that private industry would provide accommodations for about 110,000 persons and that public housing would take care of about 50,000 more in permanent, demountable and demolishable dwellings. About 20,000 persons were to be housed in dormitories and about 100,000 in the 12,000 rooming and boarding houses in the district. In spite of all these new accommodations, Washington was overcrowded in 1942, and the National Housing agency launched a program for conversion of large houses into apartments, to be located in areas designated by the National Capital Park and Planning commission as zoned for multi-family dwellings and within an hour's transportation of the central public buildings or adjacent to outlying government buildings. Restricted, single-family districts were protected from structural changes, but families might rent surplus rooms during the war period.

In connection with the housing program for Washington, the National Capital Park and Planning commission prepared seven maps showing: (1) areas served by water supply and sanitary sewerage systems; (2) transit, transportation and time zones; (3) availability of electric service; (4) availability of gas service; (5 and 6) schools, hospitals and recreational facilities for white people and Negroes; (7) land use—existing commercial development.

The National Capital Park and Planning commission was pushing to completion three unfinished projects: (1) the Fort drive connecting the Civil War forts around the city; (2) the East Capital development on the Anacostia river; and (3) the George Washington Memorial parkway to Great Falls on the Potomac.

(H. Js.)

Water-Borne Commerce of the United States.

The release of statistics on water-borne commerce of the United States has been suspended for the duration of the war period. Accordingly, the office of the chief of engineers is not in a position to furnish commercial statistics for the year 1942. (*See* Canals and Inland Waterways.) (E. Rd.)

Wavell, Sir Archibald Percival

(1883–), British soldier, born in May, was the son of Maj. Gen. A. G. Wavell. Following his father's career, he enlisted in the Black Watch in 1901 after studying at the royal military college and the staff college and saw action in the Boer War, in India and in World War I. He then served with the Egyptian expeditionary force until 1920. In 1938 he was promoted to lieutenant general. From 1937 to 1938 he commanded the British troops in Palestine and Trans-Jordan, and in 1940 he became commander in chief of the British forces in the middle east. His small force of empire soldiers swept the Italians out of Cyrenaica in Libya, and he supervised the operations in East Africa which recaptured British Somaliland and took Italian Somaliland, Eritrea and Ethiopia from the Italians. He suffered serious reverses at the hands of the Germans, however, in Libya, Greece and Crete, and on July 1, 1941, he was succeeded as middle east commander by Gen. Sir Claude Auchinleck, whose post as commander of the British forces in India Wavell thereupon took over. In August, Wavell directed the British campaign which resulted in the joint British-Russian occupation of Iran. After the Japanese declaration of war Dec. 7, Wavell met at Chungking with U.S. Gen. George H. Brett and Chiang Kai-shek to discuss measures for common prosecution of the war against Japan. On Jan. 3, 1942, Wavell was named supreme commander of the allied forces in the far east, with Gen. Brett as his deputy. The following March, Gen. Wavell was returned to his former post as commander in chief of India and Burma. On Dec. 15, he asserted that the Japanese peril in India had lessened and on Dec. 19, he launched a drive into Burma. He was named a field marshal on Jan. 1, 1943.

WAVES: *see* Women Accepted for Volunteer Emergency Service.

Wealth and Income, U. S. Distribution of.

By the distribution of income is usually meant its apportionment among individuals according to the size of income; that is, an analysis of the number of individuals or consumer units receiving incomes of various amounts. Although interest in this subject grew out of social and economic reform movements, data on the size distribution of income have many other uses in connection with government and business economic policy. Business marketing programs and even production schedules, taxation policy, social security requirements, and such things as price control, rationing systems and plans for war bond sales are dependent upon knowledge of the distribution of income by size.

Despite wide interest in this subject and its recognized importance, no completely satisfactory study of the size distribution of income in the United States had been made up to the close of 1942. All existing studies suffered to some extent from lack of adequate basic data. Nonetheless, considerable progress was made and studies were available which provided much useful information, even though their results could only be said to be tentative.

The most comprehensive study was that issued by the National

Table I.—*Size-Distribution and Utilization of Consumer Incomes in the U.S., 1935–36*

(In millions)

†Taxes shown here include only personal income taxes, poll taxes and certain personal property taxes.

Resources committee. It provided a wide variety of data on both the distribution of income and the disposition of income for the year 1935–36. Three reports were published: *Consumer Incomes in the United States, Consumer Expenditures in the United States* and *Family Expenditures in the United States.* These studies were developed from income data for some 300,000 consumer units (augmented by income tax data for the higher incomes) and expenditures data for about 60,000 units. Some of the basic information in these reports is presented in Tables I (p. 755) and II.

During 1942 the bureaus of labour statistics and home economics made small studies of the distribution of income for 1941 and the early part of 1942 which are very illuminating in showing the changes that occurred under the impact of the expansion of income and mobilization for war. The over-all results of these studies, together with the comparison for the year 1935–36 are shown in Table III. It should be recognized that Table III is not comparable with Tables I and II since it is based on only money income whereas the latter two tables also include income in kind.

The most striking result of the expansion of income after 1935–36 was to move families out of the smallest income classes and into the larger income classes. In 1935–36, for example, the largest single group of income recipients was that which received between $500 and $1,000 whereas in both 1941 and 1942 the largest group was that receiving between $2,000 and $3,000. More than half of the families in 1935–36 had cash incomes below $1,000 and almost three-fourths had cash incomes below $1,500. In the early part of 1942, on the other hand, less than one-third of the families had incomes below $1,000 and less than half had incomes less than $1,500. Similarly, only 16% of the families in 1935–36 had incomes above $2,000 whereas in 1942 almost 40% had incomes above this level.

Table III.—*Percentage Distribution of Aggregate Money Income and Expenditure of Consumers, 1935-36, 1941, and 1942**

(Preliminary national estimates including both urban and rural consumers)

Net Money-Income Class	All Families†			Aggregate Consumer Money Income			Aggregate Consumer Expenditure		
	1935–36	1941	1942	1935–36	1941	1942	1935–36	1941	1942
0 to $500	25	16	16	5	2	2	8	4	4
$500 to $1,000	28	19	16	15	7	5	18	8	7
$1,000 to $1,500	20	16	15	18	9	7	20	11	10

*Annual rate for 1942 based on first quarter.

†Includes families of two or more persons and single consumers.

Inasmuch as the rise in incomes tended to take families out of the smallest income groups, the families receiving $1,500 or less obtained a much smaller proportion of the aggregate consumer income in 1941 and 1942 than they did in 1935–36. As can be seen in the table, families with $1,500 or less received 38% of aggregate income in 1935–36 but only 14% in the early part of 1942. This does not mean, as is sometimes thought, that the low income families had failed to participate in the increase in income but rather that, by participating in the increase in income, they had been taken out of the smallest income groups.

Obviously the data in the table do not reveal what the increase in income had been according to the size groups which existed in 1935–36. In other words, we cannot tell whether persons who received $1,000 or less in 1935–36 gained more or less than persons who received $5,000 or more in 1935–36. The information which would answer questions of this sort simply was not available in 1942.

Although the data are too extensive to be presented here, mention should be made of the information on the size distribution of wage income that became available through the census of 1940. For some purposes the census income data is not as useful as smaller studies since it is restricted to wage income alone. However, the wealth of detail is so much greater than had ever been available previously that it is bound to become one of the most fruitful sources of information on the distribution of income by size. The data were being made available on a state basis, showing the distribution of wage income by sex, occupational group and industry. Furthermore, it was expected that tabulations would be prepared on a family basis as well as on the basis of the individual income recipient. This information could be obtained from the census bureau in Washington.

It might be mentioned also that the reduction in the exemptions under the income tax law, which would have the effect of requiring a vast new group of people to file income tax returns, would in a few years provide a new and most significant body of information on the distribution of income by size. It was anticipated that over 40,000,000 persons would be subject to tax on their 1942 incomes. This would, of course, cover the bulk of the aggregate consumer income and employed population so that the tabulations of income tax returns were expected to be the best source of information on the distribution of income by size.

State Distribution of Income Payments.—Information on the geographic distribution of income in the United States is provided by the department of commerce annual estimates of income payments to individuals in the various states. It may be seen from Table IV that the variations in both total and per capita income are substantial. These data relate to dollar income and consequently do not take account of geographic differences in the cost of living. The variations, however, are too large to be explained by this factor. The data bring out the lower levels prevailing in predominantly agricultural states, and the comparatively lower per capita income in the south as against the rest of the nation.

The importance of the prevalence of agricultural activity in an area in determining the level of per capita income is strikingly illustrated by the District of Columbia. This area stands highest

Table IV.—*Distribution of Income Payments by States*

*Per capita income cannot be computed beyond 1940 because the extent of population shifts since that time is not known.

in the table of per capita income because it is entirely a metropolitan area, without an agricultural industry. It was known that other metropolitan areas would show even higher per capita income, particularly those dominated by manufacturing industries. As previously mentioned, of course, the high per capita income figure shown for the District of Columbia does not take account of the high cost of living in that area and the fact that there are many types of expenses required in urban communities which do not materially add to the standard of living.

The data in Table IV show that all states participated in the expansion of income that had been generated by the nation's rearmament effort. While the state gains in income differed fairly markedly both between 1939 and 1941 and between 1940 and 1941, the income of every state increased substantially. The fears expressed by some persons that the rearmament prosperity would be limited to the industrial states was not borne out by the facts. Thus, while many of the highly industrial states scored advances that were better than the national average, equally substantial increases were made also in important agricultural states. If one takes account of the fact that the states with the largest gains were affected either by unusual increases in population since 1939 or by unusually low levels of income in 1939, it can be said that the increase in income after 1939 was fairly equally distributed throughout the nation.

It was certainly evident by 1942 that the increase in income flows induced by the rearmament program in 1941 was not restricted to the few highly industrial states which received the bulk of the primary defense contracts. There were two reasons why incomes were distributed much more widely. In the first place, the primary war contracts failed to give an adequate geographic distribution of actual war production. Subcontracting and purchasing of materials were just as important and perhaps more so in the war production program than the points of final assembly which alone were indicated in the war contract. Through subcontracting and purchasing materials, therefore, the immediate repercussions of the primary war contracts were distributed widely throughout the nation.

Even more important upon the state distribution of income were the repercussions upon all industries flowing from government spending on war materials. For, as the incomes of persons in the war industries went up, such persons tended to spend more and more on all the products of industry and agriculture available, so that the earnings of persons all over the country were stimulated. (*See* also BUDGETS, NATIONAL; CENSUS, 1940; NATIONAL INCOME AND NATIONAL PRODUCT.) (M. GT.)

Weather: *see* METEOROLOGY.

Weber, Joseph M. (1867–1942), U.S. actor, theatre manager and member of the Weber and Fields burlesque team, was born Aug. 11 in New York city. At the age of 10, Joe Weber began his stage career with Lew Fields and managed several theatrical enterprises with him until 1904, when the two separated. Weber then ventured into theatre ownership in New York city, but he rejoined his old partner later. In failing health after the death of Fields in 1941, Weber died in Los Angeles, May 10, 1942. (See *Encyclopædia Britannica.*)

Weingärtner, Felix (1863–1942), Yugoslav-Swiss conductor and composer, was born June 2 in Zara, Dalmatia. A talented young musician, he studied music at the Leipzig conservatory in 1883. Franz Liszt saw great promise in the youthful composer and arranged to have Weingärtner's first opera, *Sakuntala,* produced at the Weimar court theatre in 1884. He subsequently became a conductor at the Koenigsberg theatre. His second opera, *Malawika,* was produced at the Munich court theatre in 1886. In 1891, he became kapellmeister in the Berlin royal opera and conductor of the Berlin symphony orchestra. His fame as a conductor grew steadily, and in 1908 he was invited to lead the brilliant Vienna opera. He made his first appearance in the United States as guest conductor of the New York Philharmonic. The following year he toured the country. He was head of the Basle conservatory in Switzerland, 1927–28, and director of the Vienna State opera, 1928–36. In 1937, he directed several Beethoven and Wagner concerts in Soviet Russia. Nazi Germany frowned upon the conductor's trip, and Weingärtner, who disapproved of Hitler, severed all connections with the Reich and made his home in Switzerland. He wrote many librettos and poems, several books on musical problems and edited many musical works. He died in Winterthur, Switzerland, May 7.

Welles, Sumner (1892–), U.S. undersecretary of state, was born Oct. 14 at New York city and was educated at Groton (Mass.) school and at Harvard. In 1922 he was U.S. commissioner to the Dominican Republic, and in 1924 he was President Coolidge's personal representative in Honduras, then in the throes of revolution. Welles was appointed assistant secretary of state April 6, 1933, and except for a short period as ambassador to Cuba in 1933 held this office until his appointment May 21, 1937, as undersecretary of state. In the spring of 1940 he undertook a "fact-finding mission" to Germany, Italy, France and Great Britain. During 1941 he held innumerable interviews with various European and Asiatic diplomats, with particular attention to the status of unoccupied France in its relationship to Germany.

Welles headed the U.S. delegation to the Pan-American conference which opened at Rio de Janeiro Jan. 15, 1942. In April 1942, when Vichy veered too close to the axis, he held up shipments of food and clothing to North Africa. An address of Oct. 8, in which he declared that Argentina and Chile were harbouring axis spies, had wide repercussions in South America.

Wellesley College.

A women's college in Wellesley, Mass., founded in 1870 by Henry Fowle Durant, Wellesley occupies 400 ac. bordering on Lake Waban. A four-year liberal arts college, Wellesley is pre-eminently for candidates for the B.A. degree, but offers also the degrees of master of arts, master of arts in education, master of science and a certificate in hygiene and physical education.

By government request the physics department offered a course in radio. At commencement in 1942 Madame Chiang Kai-shek, on the 25th anniversary of her graduation, was granted the LL.D. degree; the establishment was announced of the May-ling Soong foundation "to interpret China and the nations of the east to American college students."

For statistics of faculty, student enrolment, endowment, etc., *see* UNIVERSITIES AND COLLEGES. (M. H. McA.)

Wells, Carolyn

(? –1942), U.S. author, was born in Rahway, N.J. A successful writer of juvenile fiction and nonsense verse, she tried her hand at mystery stories and launched Fleming Stone, a fictional detective, on a career of crime investigation that led through scores of mystery books. Among her works were a number of anthologies, including *A Nonsense Anthology* (1902); *Technique of the Mystery Story* (1915); *The Technical Mystery Story* (1929); *The Rest of My Life*, an autobiography (1937), and some 80-odd mystery stories. Miss Wells died in New York city, March 26.

West Africa, British: *see* BRITISH WEST AFRICA.

Western Australia.

A state of the Australian commonwealth; area 975,920 sq.mi.; pop. (est. Dec. 31, 1941) 467,082. Chief city: Perth (pop. Dec. 31, 1940—including Fremantle) 228,000. Governor: (vacant in 1942); lieutenant governor: Sir James Mitchell.

History.—J. C. Willcock, the state premier, whose government remained in office throughout 1942, set up a new record for public service in the state. He had held ministerial office for more than 15 years. While the policy of the government was to assist the federal administration in its prosecution of the war, it strongly opposed the federal uniform tax proposals as an unnecessary and invalid incursion of state rights, and joined other states in contesting the validity of the federal legislation.

Consequent upon the demands on manpower arising from the war, unemployment was reduced to a minimum, and by the end of the year there was a distinct shortage of both skilled and unskilled labour in primary as well as manufacturing industries.

Education.—In 1939: state primary schools 844; average attendance 49,770. State secondary schools 5; average attendance 5,672.

Finance.—Revenue (1940–41), £A11,432,000; expenditure, £A11,421,000; debt outstanding (June 30, 1941), £A97,792,000.

Communication.—Roads (June 30, 1939) 29,722 mi. fit for motor traffic; railways (Dec. 1941), government, 4,381 mi.; motor vehicles licensed (Mar. 31, 1942): cars 32,364; trucks 23,652; cycles, 5,088. Wireless receiving set licences (Mar. 31, 1942) 92,861.

Agriculture and Manufacturing.—Production: wheat (1941–42) 37,500,000 bu.; wool (1940–41) 71,400,000 lb.; gold (1940) 1,191,481 fine oz. Industry and labour (1940–41): factories 2,056; employees 22,734; gross value of output £A21,824,974; unemployment (trade union returns) (March 1942) 1.7%.

(W. D. MA.)

West Indies.

An archipelago between South America and Florida, embracing the Greater Antilles (Cuba, Hispaniola, Puerto Rico and Jamaica, with lesser dependent islands) and the Lesser Antilles chain of small islands extending from the Virgin Islands to Trinidad, and including some other small islands. The area is approximately 99,000 sq.mi. The population (estimated at roughly 12,500,000 at the end of 1941) is three-fourths white and one-fourth Negroid in Cuba and Puerto Rico and 80% to 99% Negroid elsewhere, except in Trinidad, where East Indians comprise 40%. Languages: Spanish, English, French and Dutch. Religion: generally Roman Catholic. There are three republics in the area, one Netherlands, two French and six British colonies, and two United States dependencies.

History.—During 1942 the course of events in the West Indies was dominated by World War II and its effects, which overshadowed all else. With the exception of the French colonies, whose position was anomalous, the entire archipelago was not only at war with the axis powers, but a combat area as well. Submarine attacks and ship losses became commonplace. These, coupled with the extensive diversion of bottoms needed for war transport, served to disrupt trade seriously.

Trade, Production, Communication.—Normally, trade is mainly with the United States and Canada and, in the European colonies, with their respective metropolises. During 1942, however, this trade was materially reduced. Sugar, the most important crop, had been in abnormally heavy demand, but shipping shortage prevented export of a large portion of the crop. Cacao, bananas, spices and citrus fruits constituted practically the sole exports except in Trinidad and Curaçao, and to some extent in Cuba, where mineral exploitation is under way. Petroleum and asphalt are important in Trinidad, and some metals are found in Hispaniola and Cuba. Existence of bauxite deposits in Jamaica was reported in 1942. Curaçao is a leading world oil-refining centre.

External communication is by sea. The more important islands are directly connected with the Pan American Airways hemisphere network. (*See* also CUBA; CURAÇAO; DOMINICAN REPUBLIC; FRENCH COLONIAL EMPIRE: *French Possessions in America;* HAITI; HISPANIC AMERICA AND WORLD WAR II; PUERTO RICO; VIRGIN ISLANDS; WEST INDIES, BRITISH.)

BIBLIOGRAPHY.—*West Indies Year Book, 1941–42.*

West Indies, British.

The several British islands in the West Indies have an area of 8,240 sq.mi. The total population in 1942 was estimated at around 2,300,000. No census had been taken since 1931, however, and in some colonies not since 1921. Racially, the population ranges from 75% to 99% Negro and mulatto, except in Trinidad, where East Indians comprise around 40% and Chinese 1%. The chief cities are the colonial capitals (*see* table on p. 760). Only Kingston and Port of Spain and, to some extent, Bridgetown are important in the West Indies as a whole.

Politically, the islands are administered separately or in groups as British crown colonies (*see* table); after 1940 the islands, with

British Guiana and British Honduras, had a common comptroller for development and welfare, with whom were associated some other officials charged with special duties. Each colony has a governor or other chief executive and subordinate officials appointed by the crown (for names of governors, *see* BRITISH EMPIRE).

The United States, under an agreement effected March 27, 1941 (supplanting the previous temporary one of Sept. 3, 1940) obtained several military, naval and air bases under 99-year lease. These comprised some 55 sq.mi. in Jamaica, including Portland Bight, its approaches and adjacent land areas, the Portland Ridge peninsula shoreline, the shoreline of Manatee bay and adjacent areas, Pigeon island (about 50 ac.), and two other small areas; four tracts in Trinidad aggregating about 32 sq.mi., along with special anchorage right in the Gulf of Paria, and wharfage facilities in Port of Spain; two tracts in Antigua, in and around Parham harbour (430 ac.) and $1\frac{2}{3}$ sq.mi. along Judge's bay shoreline; and six tracts (approximately 1,300 ac.) in St. Lucia, including Gros Islet bay.

History.—In 1942 the British West Indies were more acutely affected by war conditions than in either 1940 or 1941. For the first time actual hostilities were carried on within their territorial waters. Submarine sinkings and the diversion of ship bottoms for the transportation of supplies to overseas war fronts seriously impeded the exportation of products and sharply reduced the volume of imports.

Submarines were active in the Caribbean area throughout 1942, above all in the middle months. In September shipping anchored in Carlisle bay, Barbados, was attacked. Late in the year the undersea menace abated considerably, but was in no sense done away with. No official disclosures were made on the extent of submarine damage. It was clear, however, that British West Indian trade, interisland and external, was seriously disrupted.

To meet the war-caused shortage of imported foods, the islands undertook programs of food self-sufficiency. Thus, Barbados made it compulsory to devote fixed percentages of land area to food crops and livestock. Other colonies subsidized acreage put in foodstuffs and guaranteed minimum price returns. Licensing of imports curtailed or prevented use of shipping space for nonessentials, and to achieve maximum efficiency in the import of necessities, official buying pools were set up. Export of commodities needed for local consumption was forbidden.

In general the cost of living throughout the West Indies had risen sharply by 1942. In Trinidad and Tobago it was 65% greater than in 1935 (70% for foodstuffs), and in Jamaica 11.7% over Aug. 1939 (40.8% for food). Comparable figures for Barbados for the same period were 52% and 55%.

An additional war effect which began to be felt strongly by late 1942 was increasing unemployment. Earlier, the construction of military, naval and air bases initiated in Sept. 1940 by the United States had tended to offset adverse economic effects of the war in Jamaica, Antigua, Trinidad and St. Lucia, and indirectly in other islands. At times this development had even caused labour shortages. As completion of the bases neared, however, the declining employment brought repercussions, accentuated by the fact that the construction wages had been greatly in excess of local standards.

As an antidote to the acute economic ailments of the West Indian colonies, the British government undertook to purchase the entire crops of certain agricultural products, notably Jamaica's bananas, citrus and sugar, even when shipping space and available markets were entirely lacking. Likewise, through the West Indian Welfare fund of £1,000,000 annually, administered largely by the comptroller of development and welfare, advances were made for specific projects, especially those furthering agricultural diversification and self-sufficiency.

Long-range problems of the British West Indies were not neglected during 1942. The Anglo-American Caribbean commission met first in March to study political, economic and social problems, and continued its activities through the year.

Education.—There were about 1,338 elementary schools in 1942, with some 325,000 pupils, as well as secondary schools. Higher education was provided at Codrington college, near Bridgetown, Barbados, and at the Imperial College of Tropical Agriculture.

Finance.—The monetary unit is the pound sterling except in Trinidad. The Trinidad dollar (established in 1935) is valued at 4*s.* 2*d.* and is normally equivalent to the United States dollar (1942 value: approx. 83 cents U.S.). It is legal tender in Grenada, St. Lucia and the Leeward colonies, as well as in Trinidad and Tobago.

Trade and Communication.—Due to war conditions, particulars as to external trade were not available for publication in 1942, and were at best fragmentary for 1941 and often for 1940 as well. All reports for 1942 indicated a generally very sharp decline in volume, particularly in the bulkier products. In the five-year period 1934–1938, imports for all the British West Indies averaged $76,015,000 value, exports $64,154,000, rising to $78,344,000 and $70,796,000 in 1939, and $84,780,000 and $62,143,000 in 1940, with the great bulk accounted for by Trinidad. Not including Trinidad, imports were: 1934–38 average, $42,924,000; 1939, $46,329,000; 1940, $39,545,000; exports were, respectively, $33,891,000, $36,163,000 and $23,284,000. Trade was generally dominated by Canada, followed by Great Britain and the United States. Through 1939, foodstuffs made up 22% of all imports, textiles, manufactured goods and petroleum most of the balance. Exports were sugar and derivatives, 32.0%; petroleum (entirely from Trinidad), 31.0%; bananas (98.7% from Jamaica), 17.2%; cacao, 4.4%; spices, 2.6%; citrus fruits and other products, 2.5%. Sugar constituted 90% of the exports of Barbados and more than half those of the Leeward Islands and St. Lucia.

External communication in 1942 was by steamship and by air. Pan American Airways service to Jamaica, Antigua, Barbados and Trinidad was supplemented by British West Indian Airways lines to the last two islands and Tobago and by the "KLM" (Royal Netherlands Airways), linking Trinidad and Jamaica with Curaçao and Venezuela. Interisland communication was generally inadequate. Kingston, Bridgetown and Port of Spain are the principal ports of call. Only Jamaica (210 mi.) and Trinidad (123 mi.) had railways of any length in 1942. The Leeward colonies together had 78 mi. of railway. Roads were adequate for local needs.

Agriculture.—Nearly all the islands are heavy sugar producers, with Barbados, Antigua, St. Kitts, Nevis and the Virgin Islands primarily dependent on sugar. The total acreage in sugar in 1942 was approximately 204,571 ac. as follows: Trinidad and Tobago 67,000 ac.; Barbados 66,000 ac.; Jamaica 40,091 ac.; St. Kitts-Nevis 13,000 ac.; Antigua 12,900 ac.; St. Lucia 4,000 ac.; St. Vincent 1,380 ac.

More than 97% of the banana acreage, or 72,909 ac., in 1942 was in Jamaica, normally the world's largest single banana exporter, while St. Vincent, St. Lucia, Grenada and Dominica had 1,000 to 700 ac. each. Under war conditions, however, banana exportation practically ceased, necessitating an imperial compensation payment system.

Cacao (237,014 ac.) led in Trinidad and Tobago (210,000 ac.) and in Grenada (20,500 ac.). St. Lucia had 4,250 ac. in cacao in 1942.

A total of 106,425 ac. was in coco-nuts, largely in Trinidad and Tobago (52,500 ac.), with approximately 5,000 ac. each in

Area and Population Estimates, British West Indies

Colony	Area (sq. mi.)	Pop. (latest est. as of 1942)	Capital (with est. pop.)
Barbados	167	198,023	Bridgetown (70,500)
Jamaica and dependencies

St. Lucia and St. Vincent, and 1,200 ac. in Dominica. Jamaica led in coco-nut export, with 17,494,213 out of a grand total of 27,142,438 nuts in 1940, followed by St. Vincent (3,348,351), St. Lucia (3,336,107) and Trinidad (2,603,337).

In 1941 around 22,000 ac. were planted in cotton, of which 18,066 ac. was the sea-island variety. In 1940 production was 7,791 bales (of 400 lb.). St. Vincent (6,450 ac.), St. Kitts-Nevis (5,000 ac.), Grenada (5,000 ac.), Montserrat (4,500 ac.) and Antigua (3,500 ac.) had the largest cotton acreage. The heaviest yield was in St. Kitts (259 lb. per acre).

Citrus fruits, especially oranges, limes and grapefruit, were grown in most of the colonies, with 11,695 ac. in citrus groves in 1941. Dominica (more than half of whose export values were made up by citrus fruits), St. Lucia, Trinidad and Montserrat accounted for most of the world's lime juice production.

Arrowroot made up two-thirds of the exports of St. Vincent, the dominant world producer (1940: 9,221,114 lb.). Spices were important, notably in Grenada, where nutmeg (1940: £79,596 value) and mace (£39,602 value) made up approximately half the exports. Jamaica was the sole source of pimento ("allspice") and an important ginger producer.

Jamaica provided 80% of the 1940 coffee production of 53,283 bags, Trinidad and Tobago practically all the remainder, with a slight but increasing volume from Dominica.

Mineral Production.—Except in Trinidad, where petroleum (1942 est.: 27,375,000 bbl.) and asphalt dominate economic life, and in Barbados, where some slight petroleum deposits are known to exist, the British West Indies lack mineral resources. Late in 1942 the presence of bauxite clay in Jamaica was reported.

Westley, Helen

(1879–1942), U.S. actress, was born in March in Brooklyn, N.Y. She made her first stage appearance in New York city in 1897 and then went through the mill of vaudeville and stock performances until 1915, when she joined the Washington Square Players. One of the original founders of the Theatre Guild, she appeared in many Guild plays and established a reputation for character roles in such productions as *He Who Gets Slapped, The Adding Machine, Caesar and Cleopatra, The Guardsman* and *The Doctor's Dilemma.* In 1934 she went to Hollywood where she had featured parts in *Show-Boat, Death Takes a Holiday, Zaza, The House of Rothschild, Heidi* and *My Favorite Spy.* She died in Middlebush, N.J., Dec. 12.

West Virginia.

A state in the Appalachian mountain region in the eastern part of the United States, sometimes called the "Panhandle state" and sometimes the "Mountain state." West Virginia was formed from Virginia during the Civil War and admitted to the union June 20, 1863. Area, 24,282 sq.mi.; population (1940) 1,901,974, of which 1,742,320 were white (41,782 foreign born). Its total urban population was 534,292. Its capital is Charleston (pop. 67,914). Its other chief cities are Huntington (78,836) and Wheeling (61,099).

History.—The chief state officers in 1941–42 were: governor, Mansfield M. Neely; secretary of state, William S. O'Brien; treasurer, R. E. Talbott; auditor, Edgar B. Sims; attorney-general, Clarence W. Meadows. All except the governor were re-elected in Nov. 1940. For governor, Neely received 496,028 votes and D. Boone Dawson, 383,698. In June 1942 Attorney-General Meadows was succeeded by William S. Wysong who had been serving as president of the board of control.

Education.—Education is free in the public schools for all children between 6 and 20 years of age and is compulsory for all between 7 and 16. The pupil enrolment (net) in the 4,744 state elementary schools for 1941–42 was 302,230. In the 387 state high schools it was (net) 141,107. The number of teachers was 10,717 in the elementary schools and 5,402 in the high schools. The total state appropriation for elementary and secondary education in 1941–42 was $15,050,000 (the general school fund, $806,541).

The state supports seven teacher-training colleges which in 1941–42 had a total student enrolment of 4,182 and a total instructional membership of 321, and received state appropriations amounting to $1,133,050. It also supports the West Virginia university, which in 1941–42 had an enrolment of 3,865 (including summer), a total faculty membership of 280 and 50 assistants, and a total income of $2,957,599.

Public Welfare, Charities, Correction.—In Jan. 1941, a more extensive program of public assistance and relief was begun. The number of old-age, blind and dependent children assistance cases rose from 18,000 in July 1940, to 29,500 in July 1941 and to 37,191 in July 1942. The relief load grew from 12,775 to 14,347 and to 17,470 in Feb. 1942. The average grants of aid were also increased. For the year ending July 1, 1942 the total expenditure for old-age assistance was $4,448,973; for the blind, $247,376; for dependent children, $3,942,600. Including the cost of administration, the total cost of public assistance was $9,329,414. The total general relief fund was $3,395,779.

Communication.—In 1941–42 the state had about 4,171 mi. of steam railway (about 7,058 mi. including all sidings), 122 mi. of electric railway and an extensive system of improved highways (approximately 13,872 mi., of which 10,396 mi. were hard-surfaced). The total mileage of air lines in the state was 750 (450 miles passenger-carrying); there were 7 improved airports and 18 partially-improved landing fields. The total number of telephones was 198,000.

Banking and Finance.—On June 30, 1942, the total deposits of the 103 state banks and trust companies were $176,258,917. The total deposits of the 77 national banks in the state were $217,197,747. Resources of 22 federal savings and loan associations were $20,345,193. Resources of 38 state building and loan associations were $11,467,338.

State receipts for 1941–42 were $204,650,382; disbursements, $180,359,664; balance, July 30, 1942, $24,290,717. On July 1, 1942, the total state funded indebtedness was $73,963,000; the total amount of outstanding state road bonds was $71,213,000. Total state debt, gross, $73,963,000; net, $68,748,087.

Agriculture.—Total cash income from farm crops and livestock in 1941 was $50,573,000; income from government payments was $2,523,000. The number of farms by census of 1940 was 99,282 (acreage 8,908,803), valued at $269,827,285.

Acreage, Yield and Value of West Virginia Farm Crops, 1941

	Acreage	Yield	Value
Corn	397,000	12,307,000 bu.	$11,076,000
Wheat	105,000	1,628,000 bu.	1,807,000
Oats	74,000	1,776,000 bu.	959,000
Buckwheat	13,000	254,000 bu.	213,000
Hay (Tame)	733,000	818,000 tons	9,645,000
Apples	..	5,024,000 bu.	4,019,000
Potatoes (Irish)	33,000	3,795,000 bu.	3,150,000
Barley	11,000	258,000 bu.	181,000

Manufacturing.—In 1940, the state had 3,188 reporting industrial establishments, which employed 230,726 persons and paid $396,884,878.99 in wages. These plants had a total production of about $898,722,285.80. The chief industries were steel, glass, chemicals, petroleum refining, stone, potteries and porcelain, cement, lumbering, woodworking and flour.

Mineral Production.—In 1940 the oil production was 3,444,000 bbl., and in 1941 it was 3,378,000 bbl. In 1940 the natural gas production was about 188,751,000,000 cu.ft., which increased to 240,000,000,000 in 1941. In 1940 coal production was 126,619,825 short tons, in 1941, 140,944,744 tons. Coke production (bee hive only) increased from 216,943 tons in 1940 to 267,243 in 1941.

BIBLIOGRAPHY.—*West Virginia Bluebook* and various official departmental reports.

(J. M. CA.)

Wheat. World supplies of wheat, already the largest accumulations on record, increased still further in 1942 owing to larger production among major exporting countries, but more particularly because continued wartime restrictions on international shipments pyramided mounting carry-overs year after year in countries with surpluses. The United States carry-over July 1, 1942, was 627,000,000 bu. This, with the 1942 crop, estimated by the department of agriculture at 984,046,000 bu., gave the United States the largest wheat supply in its history. World production in 1942 was placed at 4,210,000,000 bu., compared with 3,980,000,000 bu. in 1941, 4,003,000,000 bu. in 1940 and 4,281,000,000 bu. in 1939. All estimates herein exclude the U.S.S.R. and China, for which no data were available. The 1942 wheat crop in 30 European countries was only about 40,000,000 bu. below the 1941 crop of 1,420,000,000 bu. This estimate, the U.S. department of agriculture pointed out, was from available indications not official. Central Europe, the Balkans and Denmark had in 1942 a still smaller crop than the below-normal harvest of 1941. Italy and Spain had "little change to increased" production in 1942 and generally there was improvement in France, Portugal, Belgium, the Netherlands and Sweden. Six Asiatic countries produced 585,000,000 bu. in 1942 compared with 598,000,000 bu. in 1941. The French possessions in North Africa had a short crop because of unfavourable weather and labour difficulties; 65,000,000 bu. in 1942 compared with 80,000,000 bu. in 1941. Estimates of southern hemisphere production placed the 1942 crop at 200,000,000 bu. in Argentina, 145,000,000 bu. in Australia and 15,000,000 bu. in the Union of South Africa; 1941 production, 224,134,000 bu. in Argentina, 166,700,000 bu. in Australia, 14,533,000 bu. in the Union of South Africa.

The more striking developments of the crop year were in Canada and Argentina. In Canada, the world's largest exporter of wheat, a record crop, 607,688,000 bu., was produced on the smallest acreage since 1925. In 1941, owing to mounting surpluses and continued wartime restrictions, the dominion adopted a policy of reduced wheat acreage, endeavouring to substitute other crops instead, and succeeded in reducing the crop from 540,190,000 bu. in 1940 to 311,825,000 bu. in 1941. Although the area seeded in 1942 was reduced 25%, favourable conditions produced the record bumper crop. The Canadian carry-over July 31, 1942, was 424,048,429 bu., not greatly less than the record carry-over of 480,129,311 bu. in 1941. The Canadian prairie provinces, with some 25,000,000 ac. particularly adapted to the growing of wheat, had developed a wheat economy that apparently was difficult to change to meet the exigencies of war. In Argentina, continued loss of export markets resulted in a severe shortage of storage space. Grain bags were prorated among producers by the government in 1942, since there was about half the number of bags available to supply the demand. A makeshift method of storing, "estiba-silo," was adopted, consisting of a circular wall of grain-filled bags, with loose grain in the space thus formed. The Argentina carry-over in 1942 was 184,600,000 bu. compared with 95,000,000 bu. in 1941.

The area allotted to the 1942 wheat crop in the United States was 55,000,000 ac. compared with 62,000,000 in 1941. Area seeded for the 1942 crop was 53,400,000 ac.; for the 1941 crop, 62,400,000 ac. The government's loan program had been an important price factor in wheat production in the United States since it became operative in 1938. The national loan rate to farmers for 1942 was $1.14 per bu. The rate was $0.98 in 1941. In 1940 it was $0.655; in 1939, $0.64; in 1938, $0.53 per bu. Net exports of U.S. wheat were 106,000,000 bu. in 1938–39. In 1939–40 they were 45,000,000 bu., and 30,000,000 bu. in 1940–41, with still further reductions for the 1941–42 crop year. World export of wheat and flour (in terms of wheat) were 638,000,000 bu. in 1938–39; 465,000,000 bu. in 1940–41. (*See* also FLOUR AND FLOUR MILLING.) (S. O. R.)

Whiteside, Walker (1869–1942), U.S. actor, was born March 16 in Logansport, Ind. He had already acted in many Shakespearean productions when he made his New York debut in 1893 as Hamlet. He starred in Zangwill's *The Melting Pot* in 1907, appeared in *Typhoon* with Florence Reed in 1912, and was cast as Mr. Wu in the play of the same name in 1914. He was last seen in New York in 1932 in *Three Men and a Woman* and before retiring from the stage three years later made a revival tour with *The Master of Ballantrae*. Whiteside died at Hastings-on-Hudson, N.Y., Aug. 17.

Wholesale Trade: *see* BUSINESS REVIEW.

Wickard, Claude Raymond (1893–), U.S. secretary of agriculture, was born near Delphi, Ind. on Feb. 28. After his graduation from Purdue university in 1915 he took over management of a farm near his birthplace. In 1933 he was appointed to the staff of the Agricultural Adjustment administration as assistant chief of the corn-hog division. On Feb. 1, 1940 he was appointed under-secretary of agriculture, and on Aug. 19, after the resignation of Henry A. Wallace, President Roosevelt nominated him secretary of agriculture. In March 1941 Wickard took charge of the production and distribution of food to Britain and her allies under provision of the lend-lease act. He pressed the "food for freedom" program with vigour and urged U.S. farmers to multiply their output of eggs, milk, tomatoes, beans, pork and other products. Food, he said, would be a prime factor in victory; on Sept. 23 he told a house of representatives committee that the U.S. should send Britain $1,000,000,000 in food before Feb. 1942 to prevent a British defeat.

On Dec. 6, 1942, President Roosevelt made Wickard war food administrator with full control over the nation's food program.

On Dec. 10, Wickard assured the nation that, despite wartime restrictions, the American people would have plenty of food.

Wilcox, John Walter, Jr. (1882–1942), U.S. naval officer, was born March 22 in Milledgeville, Ga. He was graduated from Annapolis in 1905 and from the Naval War college, 1924. During World War I he served with the Atlantic fleet and was on destroyer duty from 1919 to 1921. He was promoted to rear admiral in 1938 and was president of the navy department's inspection and survey board, 1940–41. Adm. Wilcox was placed on active sea duty in Nov. 1941 and on April 6, 1942, the navy department announced that he had been lost overboard in "heavy weather during normal cruising."

Wild Life Conservation: *see* Fish and Wildlife Service.

Wilhelmina (Wilhelmina Helena Pauline Maria of Orange-Nassau) (1880–), queen of the Netherlands, succeeded to the throne on the death of her father, William III, on Nov. 23, 1890, her mother acting as regent until Sept. 6, 1898 (see *Encyclopædia Britannica*). In 1901 she married Henry, duke of Mecklenburg (d. 1934), and their daughter Princess Juliana, who in 1937 married Prince Bernhard Leopold of Lippe-Biesterfeld, is heiress to the throne. In 1938 Queen Wilhelmina celebrated the 40th anniversary of her accession. Following the German invasion of the Netherlands, in May 1940, the royal family took refuge in England, Princess Juliana and her two daughters subsequently leaving for Canada while Prince Bernhard remained with Queen Wilhelmina, who established a government in exile and by her sturdy courage and the heartening messages broadcast to her subjects everywhere proved a source of inspiration to all Netherlanders. In 1942, Queen Wilhelmina visited Canada and the U.S.A., reaching Government House at Ottawa on June 18, and proceeding later to President Roosevelt's home at Hyde Park. On July 24 she paid an official visit to New York city, and on Aug. 6 she addressed a joint session of both houses of congress at Washington. She returned to London Aug. 26.

Willard, Daniel (1861–1942), U.S. railroad executive, was born Jan. 28 in North Hartland, Vt. Forced to leave agricultural college at the age of 18 because of serious eye trouble, young Willard went to work on his father's farm and later worked as track labourer for the Central Vermont railroad. His rise to president of the Baltimore and Ohio railroad, a post he held from 1910 until his resignation in 1941, came after long years of experience in all branches of railroading. He served in executive capacities with several of the country's leading railroad lines before taking over the presidency of the B. & O. He died in Baltimore, July 6.

Willkie, Wendell Lewis (1892–), U.S. attorney, business executive and politician, was born Feb. 18 in Elwood, Ind. After being graduated from the University of Indiana with an A.B. degree in 1913, he taught history in the high school at Coffeyville, Kan. In 1916 he received his law degree from the University of Indiana and joined his father's law firm in Elwood. During World War I he was a captain in the 325th field artillery in France. In 1929 he joined the legal staff of Commonwealth and Southern, a large utilities holding company. Four years later he was president of the company.

His nomination for the presidency by the Republican convention June 28, 1940, was described as a political "miracle." He was defeated by a substantial margin in the election of Nov. 5, 1940, although he received 22,333,801 votes.

Willkie went to England in Jan. 1941 and upon his return to the U.S. testified on behalf of the lend-lease bill. In the late summer of 1942, Willkie made a world tour as special representative of President Roosevelt, conferring with Churchill in London, Stalin in Moscow and Chiang Kai-shek in Chungking. On returning to the United States Oct. 26, he called for a second front to aid Russia and an Allied offensive in Burma to help China. But in espousing foreign policies "objectionable" to many Republicans, he had apparently lost the support of the party organization.

Willson, Beckles (1869–1942), Canadian author, was born Aug. 26 in Montreal. He worked as a journalist in the United States and England and later specialized as writer in colonial subjects, biography and history. He served overseas with the Canadian forces in World War I, becoming a lieutenant colonel in 1918. The last 20 years of his life he spent in London and Paris. He was the author of *Newfoundland, the Tenth Island* (1897), *The Hudson's Bay Company* (1899), *The East India Company, The New America, The Romance of Canada, George the Third* (1907), *Life and Letters of James Wolfe* (1909), *Nova Scotia* (1911), *The Life of Lord Strathcona* (1915), *Ypres: The Holy Ground of British Arms* (1919), *England: by an Overseas Englishman* (1922), and *Life of Edward Tuck* (1941). He died at Beaulieu-sur-Mer, France, Sept. 18.

Willstätter, Richard (1872–1942), German chemist and Nobel prize winner, was born Aug. 13 in Karlsruhe, Germany. After studying at the University of Munich, he was associated with the Polytechnic institute of Zurich, where he was professor of chemistry and director of biochemical research, 1905–12. He held a chair in chemistry at the Kaiser Wilhelm institute in Berlin, 1912–16, and later accepted a professorship at the University of Munich, where he pursued his researches in the field of albuminoids. Prof. Willstätter left Munich in 1924 to conduct research in enzymes and he was said to have revolutionized research in this field by developing a new methodology. In 1915, he received the Nobel prize for his research in chlorophyll and related vegetal colourants, and in 1932 he was awarded the Davy medal of the Royal society, London. In 1933, he was given the Willard Gibbs medal of the American Chemical society. He retired to Locarno in 1939 and his death was reported from that city on Aug. 3.

Wilson, Charles Edward (1886–), U.S. industrialist. was born Nov. 18 in New York city. After a meagre grade school education, he went to work when he was only 12 years old as a shipping clerk with the General Electric company. He worked his way up through the ranks until he became president of the organization on Jan. 1, 1940. Wilson was selected by Chairman Donald Nelson for the post of vice-chairman of the War Production board in full charge of production, Sept. 17, 1942. In Dec. 1942 he was made chairman of the Production Executive committee of WPB. On Dec. 1 he was also made chairman of the U.S.-Canada Joint War Production committee, succeeding James S. Knowlson.

Wilson, Sir Henry Maitland (1881–), British army officer, was the son of an old Suffolk family. He was educated at Eton, and received a commission in the Rifle brigade in 1900. Before he was 20 he was on active service in South Africa. During World War I he fought in France and Belgium; after the war, he held appointments at the Royal Military college, Sandhurst, and the Staff college, Camberley. In 1938 he was promoted lieutenant general and was sent to command Britain's army of the Nile in 1939. There, under General Wavell, he directed the advance which swept the Italian forces from Cyrenaica. After this campaign General Wilson was made G.O.C.-in-C. and military governor of Cyrenaica. Shortly after the publication of his appointment he led the United Kingdom and Empire troops under the orders of General Papagos in Greece. On a front of 60–70 mi. in eastern Greece he was faced by overwhelming German forces which, having broken through the Greek troops on his flank, seriously threatened to surround his little army. By skilful leadership he was able to extricate much the greater part of his force in accordance with the expressed wishes of the Greek government. After this, in June-July 1941, in a campaign lasting only five weeks, he led the Allied forces which thwarted Vichy's support for a projected nazi coup d'état in Syria. In Aug. 1942, he was appointed the first commander-in-chief, Persia-Iraq.

Wilson, John Arthur (1890–1942), U.S. chemist, was born Aug. 16 in Chicago. He studied at New York university and at the University of Leeds, England, and was honorary research assistant at the Procter International Research laboratory in Leeds. He was awarded the William H. Nichols medal of the American Chemical society, New York section, in 1931, for his work in colloid chemistry and its application to leather and sanitation. His research in the properties of leather led to his discoveries of new processes for tanning skins and treating leather. In addition, Dr. Wilson developed a new method for disposal of sewage for large cities. He died in New York city, Sept. 10.

Wilson, (Robert) Forrest (1883–1942), U.S. author, was born Jan. 20 in Warren, Ohio. He was graduated from Allegheny college, did post-graduate work at Cambridge in England and then entered newspaper work, working as a reporter in Cleveland and later as a Washington correspondent. He was a captain in the chemical warfare service in World War I and after the armistice was associated with the office of the assistant secretary of war in the preparation of historical data. In 1941, Wilson published a biography of Harriet Beecher Stowe entitled *Crusader in Crinoline*. This work was awarded the Pulitzer prize for biography on May 4, 1942. Forrest died on May 9, in Weston, Conn.

Winant, John Gilbert (1889–), U.S. diplomat, was born Feb. 23 in New York city. He attended Princeton university and in 1912 became a teacher of English and assistant rector at St. Paul's school. In 1917 he entered the United States air service, becoming captain of the 8th observation squadron in France. After the war he was elected to the New Hampshire legislature, serving in both the house and the senate between 1917 and 1923. In 1925, at the age of 35, Winant was elected governor of New Hampshire; he served three terms, 1925–27, 1931–33 and 1933–35. His administration was marked by numerous social reforms. He was assistant director of the International Labour office, 1935–38 and director, 1939–41. A wealthy New England aristocrat, a liberal Republican and a supporter of the New Deal program, Winant was named ambassador to Great Britain by Pres. Roosevelt, Feb. 6, 1941. In March 1942, Winant conferred with Roosevelt in Washington on war problems.

Windham, Sir Walter George (1868–1942), British motor car and aviation pioneer, made the first motor drive from London to Brighton and won several speed records in the early days of motoring. As early as 1909, Sir Walter envisaged an airmail service and had a letter sent to himself from France to England by plane, perhaps one of the first letters sent by air. Two years later he saw his idea materialize in the establishment of the British airmail service. Prior to World War II, he repeatedly warned his government to strengthen the air arm, and once the war was in full swing estimated that the United Nations needed about 1,000,000 planes to turn the tide to victory. He died in Builth Wells, Radnorshire, North Wales, July 6.

Wines. Since viticulture is largely a peace-time agricultural pursuit, it could not be expected to thrive in war-torn Europe during the period of World War II. Details regarding the quality and quantity of the 1940 and 1941 vintages in France, Italy, Germany and the Balkans were difficult to obtain. As for the 1942 harvests in the principal wine-growing countries, reliable information was practically impossible to secure.

France has always been the outstanding wine-producing country of the world, both in respect to quality and quantity. To what extent the vineyards suffered in 1942 through neglect or the lack of material to spray the vines and shortage of skilled labour was not made known, but reports came that the German authorities required that a substantial portion of the wine produced be distilled into alcohol for their war requirements. In view of military necessities and demands, it cannot be expected that even the rare Bordeaux Chateau wines and the magnificent Burgundies and Champagne wines were wholly spared this sacrifice to the German gods of war. Italy, too, had to yield to the demand for alcohol and a substantial part of her unusually large vintage doubtless was converted into spirits. No information was of course obtainable regarding the 1942 vintages of Germany, Austria, Hungary or any of the other countries of eastern Europe. The only really reliable European wine reports were from the Iberian peninsula.

Spain produced far less in 1942 than an average wine crop, but due to generally favourable weather and freedom from the ordinary vine and root diseases, the quality of the 1942 harvest was generally satisfactory. In the Jerez (sherry) district, the qualities were promising, although there was a shortage of sweet wines. Malaga on the south coast and the Rioja districts in the northern part of Spain reported satisfactory conditions with respect to both quality and quantity, but throughout Spain, prices advanced tremendously notwithstanding a heavy falling off in exports resulting from the war.

Portugal likewise reported the general absence of mildew, oïdium and the other vine diseases, but the scarcity of rain after March resulted in a small vintage, some wine growers harvesting only 60% of their normal production. This caused but little concern, as the export business suffered grievously owing to the shortage of shipping facilities. The Casa do Douro, the government office in control, authorized the production in 1942 of 25,000 pipes (140 American gallons each) of port wine, but it was doubtful whether more than 15,000 pipes of port wine would actually be produced, the balance remaining as table wine chiefly for home consumption.

The northern part of Africa, particularly Algeria and Tunisia, has been a large producer of wine, though of the coarser and cheaper qualities. Not less than 33⅓% of the 1942 vintage had been ordered by the German authorities in control to be distilled into alcohol for war requirements, and a substantial part of the balance was no doubt shipped out for consumption by the axis troops, while their officers refreshed themselves with what was saved of the better qualities of French wines.

†Estimated production.

The situation in the western hemisphere was more favourable, but even there the war took its toll. The United States government requisitioned fully one-third of the California grape harvest for the making of raisins for the armed forces and for lend-lease purposes, and it was expected that this year's harvest of California wines would show a loss of at least 40,000,000 American gallons of wine as against the 1941 vintage. In the face of a fast-increasing demand for American wines, due partly to improving qualities and judicious advertising, and partly to the almost total absence of European wines other than sherry and port, this loss of American wine production fell heavily upon the trade and was expected to result in a substantial shortage of American wines before the end of 1942.

The Argentine Republic and Chile were greatly expanding their production of wines. They produced some fairly good qualities, although few were outstanding. On the whole, they were inferior to the better grades of North American wines. The wine harvests in South Africa and in Australia which were finding substantial markets in Great Britain and other overseas countries suffered grievously through the loss of shipping facilities. (*See* also Liquor Control.) (A. W.)

Wisconsin. One of the north-central states, Wisconsin, popularly called the "Badger state," entered the union in 1848. Area, 56,154 sq.mi., of which 54,715 sq.mi. are land. The federal census of 1940 gave its population as 3,137,587, an increase of 6.8% over 1930. The urban population was 1,679,144 and the rural, 1,458,443. Only 24,835 of the population were not white. Foreign-born whites numbered 288,774, and whites with at least one parent foreign born, an estimated 910,420. Capital, Madison (pop. 1940, 67,447). The largest city, Milwaukee, had a population of 587,472, and other large cities are Racine (67,195), Kenosha (48,765), Green Bay (46,235), La Crosse (42,707) and Sheboygan (40,638).

History.—The impact of war found Wisconsin with 48,659 men in military service as of Dec. 1, 1941. The Wisconsin Council of Defense and its county councils, set up by the governor in Oct. 1940, took on increasing importance during 1942. R. S. Kingsley was chairman of the state council. The legislature did not meet during the year.

WALTER S. GOODLAND, Republican, who became acting governor of Wisconsin Dec. 30, 1942, after the death of Orland S. Loomis, Progressive, who had been elected to the office, Nov. 3

The election of Nov. 3, 1942, was marked by bitter discussion of the pre-war non-intervention attitude of Wisconsin members of the lower house of congress, but all were re-elected except Republicans L. D. Thill and J. L. Johns, and Progressive B. J. Gehrmann, who were defeated respectively by Democrats H. J. McMurray and La Vern Dilweg, and Republican A. E. O'Konski.

The state elections showed a Republican gain in the legislature, so that Republicans held 74 of the 100 assembly seats and 23 of 33 senate seats. The state officers were all re-elected save Governor J. P. Heil, Republican, who lost to Orland P. Loomis, Progressive, by a plurality of 100,000. Heil was criticized politically for allowing the Conservation commission to remove Commissioner H. W. MacKenzie, for his frequent absence from the capital at Madison, for his expenditures in the contingent fund and for his administration of civilian defense. The death of Governor-Elect Loomis on Dec. 7 raised a constitutional question as to his successor, and the supreme court on Dec. 29 decided that under the constitution Lieutenant Governor W. S. Goodland, Republican, should serve as acting governor for the full two-year term.

The chief officers of the state in 1942 were United States Senators Robert M. La Follette, Progressive, and Alexander Wiley, Republican; and Representatives (Republican) J. L. Johns, L. H. Smith, W. H. Stevenson, L. D. Thill, F. B. Keefe, R. F. Murray, (Progressives) Merlin Hull, B. J. Gehrmann, Harry Sauthoff, and (Democrat) T. F. Wasielewski. The state officers were J. P. Heil, governor; W. S. Goodland, lieutenant governor; F. R. Zimmerman, secretary of state; J. M. Smith, treasurer, J. E. Martin, attorney-general; and John Callahan, superintendent of schools. The chief justice of the supreme court was M. B. Rosenberry.

Education.—There were 7,442 elementary schools, 464 secondary schools, and 9 teachers' colleges in Sept. 1941. The enrolment was 368,352 in elementary schools and 161,577 in secondary schools (1941–42).

Public Welfare, Charities, Correction.—The number of cases receiving public assistance as of Aug. 1942 was as follows: general relief, 14,690; WPA, 5,800; old-age assistance, 53,575; aid to dependent children, 10,609; aid to blind, 1,899—a total of 75,787. Expenditures for public assistance in 1941 were as follows: general relief, $10,232,235; WPA (July 1940–June 1941) $30,956,107; old-age assistance, $14,973,783; aid to dependent children, $5,851,738; aid to blind, $563,597—a total of $73,070,184. The amount spent for public assistance from January through March 1942 was $15,318,679. Wisconsin's unemployment compensation law was passed in Jan. 1932. The benefit payments in 1941 were $2,927,466 as against $4,584,529 in 1940. The contributions for 1941 were $13,509,273; for 1940, $11,666,453. Wisconsin's 17 charitable, penal and allied institutions were operated during July 1940–June 1941 at a cost of $3,800,876.63 (less repairs, etc.). The average daily population in 1941 was 7,678.

Communication.—The number of miles of highways as of Jan. 1, 1942 was: 84,830 (towns), 2,402 (villages), and 5,886 (cities). The total was 93,118 mi. The expenditure on highways

Table I.—*Agricultural Production, 1942 and 1941*

Crop	1942 (est.)	1941
Corn (bu.)	98,728,000	91,125,000
Oats (bu.)	100,577,000	75,669,000
Canning peas (lb.)	...	230,040,000
Tobacco (lb.)	30,965,000	31,640,000
All tame hay (tons)	7,530,000	6,720,000
All clover and timothy (tons)	...	3,484,000
Alfalfa (tons)	...	2,698,000

during July 1941–June 1942 was $34,393,764.64. The total railway mileage was 6,639. The number of airports was 47. In Jan. 1942 there were 581,700 telephones.

Banking and Finance.—At the end of 1941 there were 470 state and 97 national banks. The number of credit unions was 605. The deposits in state banks totalled $522,790,386; the assets were $587,922,620. National banks had deposits of $633,133,000 and assets of $690,362,000. The credit unions listed assets of $13,534,592. There were 123 building and loan associations with assets of $117,158,836.

The state receipts during the fiscal year ending June 30, 1942 were $140,866,708. The disbursements were $126,866,529. The state had no outstanding bonded indebtedness in 1941, but its general fund was indebted to the common and normal school funds by $1,183,700. The state budget for state departments (excluding state aid to local units) during the biennium 1941–43 was $73,868,278, greater by $2,656,302 than the 1939–41 budget. The principal increases were for pensions, the University of Wisconsin and teachers' colleges. The principal decreases were related to relief and governmental expenses.

Agriculture.—The total value of agricultural products in 1941 was $201,602,000. The total acreage harvested was 9,725,500. The gross farm income was $468,000,000, an increase of 40% over 1940. About one-fourth of this rise was caused by increased production, and the rest by advanced prices. The land used in the production of cash crops was small compared with the land used for feed crops, a result of the state's great dairy industry. Principal crops are shown in Table I.

Manufacturing.—The total value of Wisconsin's manufactured products in 1939 was $1,604,507,356, placing it 10th in rank among the states. The wages paid were $251,946,993. The number of wage-earners was 200,897 (average for the year). Wisconsin, with an extremely diversified industry, ranked first in the manufacture of cheese, milk products, malt and canned peas in 1939. Principal industries, with value of products in dollars, are shown in Table II. The world crisis had, however, made these figures obsolete in 1942, though complete new ones were not available. Between June 1940 and March 1942 Wisconsin manufacturers received $925,000,000 in defense contracts. In Sept. 1942 an estimated 322,700 workers in manufacturing were receiving estimated weekly wages of $12,220,000.

Table II.—*Industrial Production, 1939 and 1937*

Industry	1939	1937
Motor vehicles	$162,080,952	$90,700,733
Paper and paperboard mills	101,302,409	97,933,597
Meat packing, wholesale	80,234,982	72,387,364
Tractors	68,493,029	(not given separately)
Malt liquors	53,445,756	42,710,425
Dairy products		
Cheese	52,900,812	54,252,393
Condensed and evaporated milk	54,810,935	57,354,882
Creamery butter	48,217,531	63,932,363

Table III.—*Value of Mineral Products, 1940 and 1939*

Mineral	1940	1939
Stone	$5,030,263	$3,564,045
Iron ore	3,290,389	3,526,980
Sand and gravel	2,304,197	2,616,204

Mineral Production.—In 1940 the total value of mineral production was $13,554,000, compared with $12,704,942 in 1939. Leading mineral products, in dollars, are shown in Table III.

(E. P. A.)

Wisconsin, University of.

An institution of higher education at Madison, Wis. More than 2,000 students received degrees at Wisconsin's June 1942 commencement, the 89th in the university's 92-year history.

The University went "all-out" in its efforts to aid the U.S. war program during the year. The University was training 1,200 sailors, 480 WAVES, 70 pilots, 30 cooks and bakers, and 30 diesel engine technicians for the navy; 40 glider pilots for the marines; 170 mechanics and 30 civilian wood inspectors for the army air forces. The university was the centre of the Institute of Correspondence study for both the army and navy; more than 6,000 registrations had been received from soldiers and sailors by the end of 1942. More than 2,600 young men were enrolled in the university's military training department. Under the federal engineering, science, management war training program, the university organized 500 classes, enrolling more than 10,000 students for special training in war industries to speed production. More than 100 of Wisconsin's scientists were lending their special knowledge to the solution of war science problems. The university's medical school was training specialists for the armed forces. Wisconsin was the first school in the nation to register completely its women students for nurses' training and other war work. The university's colleges of agriculture and engineering were serving Wisconsin's farms and factories to the utmost to aid America's greatly increased wartime production needs.

For statistics of enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (R. Fs.)

WLB: *see* WAR LABOR BOARD, NATIONAL.

Woman's Christian Temperance Union.

Seven seminars on alcohol education sent 50 trained specialists into teachers' colleges. The course on alcohol education offered in these seminars had been accepted by seven colleges for academic credit. The acceptance of brief courses for summer schools is increasing. Four motion pictures were in circulation. These dealt with the scientific, social and economic effects of alcohol. They were on high school and adult levels. Film strips for classroom use in the grades, dealing with health, safety and economics, were available. Exhibits and many varieties of visual demonstrations were but a few of the special features of the year. The weekly magazine, the *Union Signal*, a journal of social welfare, and the *Young Crusader*, a children's paper, were increasingly added to libraries, both public and school.

The national officers in 1942 were: Mrs. Ida B. Wise Smith, president; Mrs. D. Leigh Colvin, vice-president; Miss Lily Grace Matheson, corresponding secretary; Mrs. Margaret C. Munns, treasurer; and Mrs. Nelle G. Burger, recording secretary. National headquarters, Evanston, Ill. (I. B. W. S.)

Women Accepted for Volunteer Emergency Service.

The women's reserve of the United States naval reserve was established July 30, 1942, when President Roosevelt signed the necessary legislation. The purpose of this branch of the naval reserve was to relieve for sea duty officers and enlisted men serving in naval establishments located within the continental United States. An advisory educational council composed of seven nationally known leaders in women's education was appointed to assist the bureau of naval personnel in drawing up requirements for the women's reserve and in planning for the training of its members. WAVES, the unofficial designation of the corps, was derived from the classification letters W-V(S) used by the navy department to classify the officers: Women Accepted for Volunteer Emergency Service.

President Mildred Helen McAfee (*q.v.*) of Wellesley college took the oath of office, Aug. 3, 1942, and thereby became lieutenant commander, U.S.N.R., director of the women's reserve, first woman naval officer in the history of the United States. During August, 16 administrative officers were commissioned to assist Lieutenant Commander McAfee, and a training school for officers, the Naval Reserve Midshipmen's school (WR), was established at Smith college, Northampton, Mass. This school opened officially Oct. 6, 1942. A branch of the school at Mount Holyoke college, South Hadley, Mass., opened Nov. 10, 1942.

Training schools capable of accommodating 2,200 enlisted personnel were established Oct. 9, 1942, at the University of Wisconsin, Madison, Wis. (radiomen); Indiana university, Bloomington, Ind. (storekeepers); Oklahoma Agricultural and Mechanical college, Stillwater, Okla. (yeomen). Arrangements were completed or were in the process of completion in 1942 for the training of enlisted personnel at the Georgia State College for Women, Milledgeville, Ga. (yeomen); Naval Training school, Norman, Okla. (aviation machinist's mates and aviation metalsmiths); Naval Training school, Memphis, Tenn. (aviation machinist's mates); Naval Air station, Atlanta, Ga. (Link trainer instructors); Naval Air station, Lakehurst, N.J. (parachute riggers and aerographer's mates); naval hospitals at Bethesda, Md. and San Diego, Calif. (medical specialists).

Basic training for enlisted personnel was given in 1942 at Iowa State Teachers college, Cedar Falls, Ia. A large naval training school was established at Hunter college. The Bronx, New York city. This school, capable of accommodating more than 5,000 recruits at a session, was to be utilized for the basic training of the greater part of the enlisted members of the corps.

At least 25,000 billets in the navy were open to women in 1942. Enlisted women served in regular naval ratings, such as aerographer's mate, aviation machinist's mate, aviation metalsmith, parachute rigger, pharmacist's mate, radioman, storekeeper, specialist (photographer), yeoman and seaman (Link trainer instructor, duplicating machine operator, telephone operator, file system clerk, chauffeur, information and escort clerk, mail room clerk and messenger).

No legal limitation was placed on the number who might be enlisted in the women's reserve. The size of the corps was determined by the needs of the navy department. Women received the same pay as men of equal rank and the same benefits as civil service personnel. They were given no military authority over male personnel and were instructed not to marry men in the naval service. (E. Re.)

Women's Army Auxiliary Corps.

The Women's Army Auxiliary corps (WAAC) was created by act of congress to make available to U.S. national defense the knowledge, skill and special training of U.S. women. Congressional action was completed May 14, 1942, and an executive order establishing the corps was signed by the president on May 16.

The purpose of the corps was to replace able-bodied enlisted men in noncombatant activities. At the end of 1942 there were nearly 100 specific job classifications which the WAAC was performing for the army and the army air forces, or had been requested to perform.

The corps was the first women's organization, exclusive of the Army Nurse corps, authorized to serve with the army of the United States, and the first authorized military organization for women.

The enrolment ages were set at 21–45 years, the term of service for the duration of the war and not to exceed six months thereafter.

Members in 1942 performed only noncombatant duties, in zones of operation as well as in the United States. Nomenclature for grades differed from that of the army, but equivalent pay was provided, for equal rank and grade. When the corps was first established, pay was set in amounts corresponding to old army pay rates, but a pay equalization bill to conform to revised army pay was enacted by congress and signed by the president on Oct. 26, 1942.

Grades for members of the corps, with corresponding army grades, were established as follows:

WAAC Officers	*Equivalent Army Rank*
Director	Colonel
Assistant Director	Lieutenant Colonel
Field Director	Major
First Officer	Captain
Second Officer	First Lieutenant
Third Officer	Second Lieutenant
WAAC Enrolled Members	
Chief Leader	Master Sergeant
First Leader	First Sergeant
Technical Leader	Technical Sergeant
Staff Leader	Staff Sergeant
Leader	Sergeant

TRAINEES of the Women's Army Auxiliary corps in group calisthenics at Fort Des Moines, Ia., in the summer of 1942

Junior Leader	Corporal
Auxiliary, First Class	Private, First Class
Auxiliary	Private

All members in 1942 took basic training, corresponding to training for army personnel with the omission of training in tactics and weapons. Specialist training was given also, in army administration, motor transport, baking and cooking, and communications, as well as other subjects. An intensive officer candidate course was given to officers before they were commissioned.

The First WAAC Training centre at Fort Des Moines, Ia., was opened July 20, 1942; the Second Training centre at Daytona Beach, Fla., on Dec. 1, 1942, and the Third training centre at Fort Oglethorpe, Ga., on Jan. 25, 1943.

Special training was given members at various army schools. Administrative specialist schools were established at colleges throughout the country, utilizing their excess capacities.

Limited at first to 25,000, the corps was increased to 150,000, the limit set in the creating act by executive order on Nov. 20, 1942. Within six months from the day the WAAC was created, requests by various branches of the service for members of the corps totalled this full amount.

The director of the WAAC in 1942 was Mrs. Oveta Culp Hobby (*q.v.*).

Women's Auxiliary Ferrying Squadron: *see* LOVE, NANCY HARKNESS.

Women's Clubs, General Federation of.

The General Federation of Women's Clubs in 1942 focused its activities on war service. Among the major projects were programs on conservation of fruits and vegetables, sugar rationing, gasoline rationing, probing and improving housing situations of war workers, training women for industry, home nursing and first aid, nutrition in wartime, venereal disease control, health of youth. Purchase of war bonds by clubs and club women was a major contribution to the war effort.

Special studies prepared for clubs by national headquarters included pamphlets on "The United States of America" (printed in Spanish and English), "The United States—Her Territories and Possessions," "Canada," "Mexico," "United States of Brazil," "Australia and New Zealand," "Netherlands East Indies," "India," "Women in War Service."

A series of art programs including prepared lectures on, and reproductions of, paintings and sculptures in the National Gallery of Art was made available to clubs.

The 1942 war service program of the general federation began with a national defense forum held in January at the Mayflower hotel, Washington, D.C. Heads of the civil government, the army and the navy and one thousand club leaders from all parts of the United States participated in forum discussions on military defense, civilian defense, defense of the U.S. economic system and defense of the western hemisphere.

Western hemisphere solidarity was the theme of the 51st annual convention held in Fort Worth, Tex., April 27–May 2, 1942. Statesmen and educators from Latin America and the United States participated in four afternoon forums on Latin America and its international relations, economic problems of Latin America, women in the national and international life of the American republics, education and inter-American cultural relations. Women leaders of Canada addressed the convention.

The General Federation is a federation of 16,500 clubs and organizations in the U.S., its territories and 26 foreign countries, representing a total membership of more than 2,000,000 women.

Mrs. John L. Whitehurst of Baltimore is president for the 1941–1944 triennium. The organization issues a monthly magazine—*General Federation Clubwoman.* National headquarters is at 1734 N street, Northwest, Washington, D.C. (S. A. W.)

Wood, Grant (1892–1942), U.S. artist, was born Feb. 13 in Anamosa, Ia. His father died when he was a boy, and he worked at a multitude of jobs to help support his family. In 1911, he went to Minneapolis to study handicrafts and worked on the side to pay his tuition. After World War I, he joined the great hegira of American artists to Paris and studied at the Julian academy. Wearied with talk about the supremacy of French art, he went back to Iowa to paint native American scenes. However, he did find some aridity in American culture, and he portrayed this barrenness with a sardonic brush on many of his canvasses. Among his best known works are "American Gothic," "Daughters of the Revolution," and "Dinner for Threshers." His last paintings included two landscapes, "Summer in Town" and "Summer in the Country." Wood, who joined the art staff of the University of Iowa in 1934, was made professor of fine arts in June 1941. In Jan. 1941 he became art director of *Encyclopædia Britannica.* He died Feb. 12 in Iowa City.

Wool. Estimates of sheep in the world during 1942 were figured at 700,000,000, growing 3,600,000,000 lb. of wool. The Australian clip was computed at 1,086,000,000 lb.; South America, 700,000,000 lb.; Union of South Africa, 261,000,000 lb. United States imports of apparel wool totalled 600,000,000 lb. in the first ten months of 1942 compared with 688,000,000 lb. during the same period in 1941. Average monthly consumption in the first six months in 1942 amounted to 91,002,000 lb. contrasted with 79,639,833 in 1941 for the first half of the year.

It was estimated that 800,000,000 lb. of grease wool, domestic and foreign grown, were required solely for U.S. government orders placed during the calendar year of 1942, an increase of 500,000,000 lb. over 1941. Contracts for the equipment of 10,000,000 soldiers were awarded during 1942, which included 32,000,000 wool uniforms and between 16,000,000 and 17,000,000 overcoats. These contracts specified up to 100% domestic grown wool, with approximately 75% of the 1942 clip being used for army apparel.

The use of 100% wool for civilian needs was restricted during the year. During the period from Aug. 3, 1942 through Jan. 31, 1943, worsted manufacturers were permitted to use not in excess of 25% of such basic poundage for the manufacture of fabrics and yarns of any wool content, and an additional amount of wool owned, not in excess of 30% of such basic quarterly poundage, for fabrics containing not more than 65% wool. For woollen manufacture, an amount of wool not in excess of 5% of such basic quarterly poundage could be used for the manufacture of fabrics and yarns, with an additional amount of wool not in excess of 25% of such basic quarterly poundage for the manufacture of fabrics and yarns containing not more than 65% wool.

A reciprocal trade treaty between Peru and the United States, signed on May 7, 1942, was proclaimed officially on June 29 by President Roosevelt in Washington, D.C., and President Prado y Ugarteche of Peru in Lima. This treaty included the reduction in duty of alpaca, used extensively in uniforms. The agreement between the United States and Uruguay, wherein the United States agreed to purchase from Uruguay a part of the 1941–42 and 1942–43 wool clips, was ratified in Washington on Nov. 23, 1942. In substance it covered the purchase of 30,000 bales of the older clip and 37,500 bales of the newer clip, if the latter be unsold by June 1, 1943.

In Dec. 1942 the president issued executive order No. 9280, authorizing and directing the secretary of agriculture to assume full responsibility for and control over the U.S. food program (wool being included). Many believed that this order would be instrumental in the department of agriculture's assuming jurisdiction over and possibly purchasing the 1943 wool clip. The government's stock pile of wool was announced to be 450,000,000 lb., principally of Australian, New Zealand and South African wools, including 5,000,000 lb. from South America. Of this, 33,000 bales, or 11,000,000 lb., of Australian wool were sold by public auction in Boston, Mass., during December. In addition to this holding, there were 225,000,000 lb. in storage intended for transshipment to the United Kingdom.

The War Production board's general imports order M-63, covering government control of shipping space for the importation of strategic materials, including wool, required wool importers to obtain the necessary authorizations to import wool. Import licences were granted only on grades of wool, including certain types of alpaca and wool-wastes, suitable only and deemed necessary and appropriate in the public interest and to promote the national defense. Amendments of this order included the granting of import licences for wools finer than 44s in grade. According to this order, it became necessary for importers first to apply for authorizations to import wool in amounts sufficient to cover their expected purchases for a 60-day period. (*See* also SHEEP; TEXTILE INDUSTRY.) (C. M. AN.)

Woolton, Frederick James Marquis, 1ST BARON OF LIVERPOOL (1883–), British social economist and business man, was born Aug. 24 and was educated at Manchester grammar school and Manchester university, where he gained a research fellowship in economics. To study the problem of poverty at first-hand he became warden of the university settlement in Liverpool. As part of his work there he started the first dental clinic for children in Liverpool, and five years afterwards he and his wife started the first pre-natal clinic in the city. During World War I, medically rejected for active service, he was given a post in the war office. Later he became secretary of the Leather Control board, and as part of his work there introduced the standard boot, of which 3,000,000 pairs were put into circulation.

After undertaking the reorganization of the Boot Manufacturers' federation he went to America to study industrial conditions. On his return he joined the board of Lewis's Ltd., the departmental store; in 1927 he became managing director, and in 1934 he was elected chairman.

Early in 1939 he was invited to take charge of the war office (later ministry of supply) organization for clothing and equipping the troops in preparation for war. In April 1940 he became minister of food, in which office he was responsible for many extensions of rationing and price control.

Work, Hubert (1860–1942), U.S. politician, was born July 3 in Marion Center, Pa. He was graduated from the University of Michigan medical school in 1885, practised medicine in Colorado and served in the medical corps during World War I. Work entered politics in 1908 when he served as delegate-at-large in the Republican national convention. He was first assistant postmaster general during the Harding regime, 1921, became postmaster general in 1922 and succeeded Albert Fall as secretary of the interior, 1923. He continued in this office during the Coolidge administration, but resigned his post in 1928 to become chairman of the Republican national committee and to head the Hoover election campaign. He later retired to Denver, Colo., where he died Dec. 14.

I.—INTRODUCTION

The Japanese attack on Pearl Harbor extended World War II, theretofore confined to the continents of Europe and Africa, to the western hemisphere, Asia, Australia and Oceania—the entire globe. In global war all battlegrounds are interrelated; defeats or victories on one front produce more or less decisive repercussions on other fronts, no matter how remote; a successful U-boat campaign in the Atlantic can stall a contemplated British offensive in the North African desert; a Japanese drive into the southwest Pacific can compel the United States to withdraw naval units needed to convoy supplies to Russian armies, which in turn, may be forced to withdraw deeper into the interior.

In this global conflict, the axis powers at the outset had certain definite advantages: interior positions, shorter supply lines, better-trained and better-equipped armies, and total mobilization of their peoples in the war effort. Conversely, the United Nations, with the exception of the U.S.S.R., were not psychologically or materially prepared for an all-out struggle. Britain, the United States and Russia were separated from each other by vast expanses of water. China was virtually landlocked after the fall of Burma. The United Nations navies were dispersed over seven oceans; their military supply lines were long and tenuous; their armies—again excepting Russia—lacked adequate mechanized equipment, air power and training. But the United Nations had one great and definite advantage—the virtually limitless industrial potential of the United States, whose giant production facilities were harnessed to the war effort immediately after Japan's aggression in the Pacific.

The Japanese blitzkrieg in the Pacific was no casual or fortuitous matter. It was part of the axis grand strategy, long and carefully planned, to prevent allied interference with the joint schemes of conquest drawn up by Germany and Japan. The ultimate goal of the axis was to prevent the military coalition of Britain, the United States, Russia and China. Japan drew the task of weakening Anglo-American naval power by compelling its dispersal over both the Atlantic and Pacific. Germany's part was to mobilize all the resources and manpower of conquered Europe to crush Russia, and at the same time to prevent the allies from launching an invasion of Europe. The United Nations, on the other hand, were compelled to maintain strong defensive positions in Russia and the British Isles, and to fight delaying actions in the Pacific until they could build up a war machine capable of wresting the initiative from the axis.

Japan's surprise attack in the Pacific gave the axis powers the upper hand during the first eight months of fighting in 1942. In the far east, the Japanese were sweeping through the southwestern Pacific. In Europe, German armies recovered quickly from the Russian winter offensive of 1941–42 and were driving a mighty offensive toward the Caucasus. In Africa, Rommel's armies cancelled the British gains of early 1942 with a powerful drive into Egypt. But by late summer, the United Nations, catching up in their war preparations, were strong enough to abandon delaying actions for the offensive. In August, the United States marines invaded the Solomons. The threat created by this action suspended Japanese expansion in the far east. In October, the British Eighth army launched an offensive in Egypt. On Nov. 8,* American and British armies in great force occupied French North Africa, and several weeks later the Red army launched its great offensive against weakened German armies on the eastern front.

Although the allies were attacking vigorously in Asia, Africa and Europe as the year ended, Germany and Japan were still strong and far from beaten. But the "blitzkrieg," the strategy of lightning operations designed to overwhelm the enemy's forces and obtain a quick decision, which was exemplified by the German surprise attacks on ill-equipped and ill-prepared nations, appeared to have lost its potency. The United Nations were quickly drawing up to parity with the axis in quantity and quality of war materials and were now prepared for emergencies.

---

*The first landing of the U.S.—British forces occurred at about 1:00 A.M. on Nov. 8, Algerian time. All dates in this article are given in accordance with the time of the localities where the described events took place.

II. WAR IN THE PACIFIC

On Dec. 7, 1941, Japan set in motion a synchronized land, sea and air blitzkrieg in an effort to make all Asia tributary. The Japanese won the strategic initiative at the outset because they were able to select their objectives and strike at the moment of their own choosing. The broad objects of their strategy for the conquest of the Pacific were:

(1) Total destruction of allied naval and air power in the Pacific and the concomitant neutralization of allied naval bases.
(2) Speedy occupation of Malaya, Burma, the Philippines and the East Indies, rich in natural resources necessary to establish self-sufficiency for the island empire.
(3) Consolidation of territorial gains, and prompt development of strongly fortified defenses to resist the inevitable allied counteroffensives.
(4) Subjugation of China and exploitation of her vast industrial resources.

The Japanese naval thrusts in the Coral sea, and the landing of troops in New Guinea, Dutch Timor and New Britain, pointed toward Australia as a major object of Japan's strategy of conquest. But vigorous allied counteraction in these areas compelled the Japanese to readjust whatever plans they may have had in that direction and to convert their new island outposts into an outer defense belt guarding the newly won prizes in Oceania.

The Malayan Campaign.—The object of the Japanese campaign in Malaya was the capture of Singapore, keystone of British naval power in the far east. This great fortress possessed a 50,000-ton floating dock which could cradle the largest battleships, numerous smaller docks, a formidable array of huge coastal defense guns, and four large airfields which were counted on to give the base adequate protection from air attacks. The Japanese knew that so long as this mighty base remained in allied hands, the combined Anglo-U.S. fleets could prevent projected moves to the south.

The British command in Malaya, holding to the optimistic view that Japan would not dare risk a war in the Pacific, based its strategy on the assumption that should war start, Singapore would become the chief allied base, from which the Anglo-U.S. fleet would seize the initiative to strike at the Japanese heartland itself.

This strategy was severely jolted by the Pearl Harbor attack, which immobilized the United States Pacific fleet. An even more serious blow to Singapore itself was the sinking on Dec. 10, 1941, of the "Prince of Wales" and the "Repulse," the loss of which deprived the fortress of its chief weapons for offensive operations. These twin disasters wrought a complete change in Singapore's function in allied war strategy. Overnight, the great British naval base had been stripped of its power and reduced to a land base of limited defensive strength. Furthermore, the Japanese overland attack from Thailand revealed the inherent weakness of this naval citadel—Singapore had been designed to repel an attack by sea, not by land. Few of its guns and fortifications faced the Malayan mainland, because the British command had considered an invasion through the jungles from the north to be impossible. They had insisted that the Malayan east coast would be the principal theatre of operations; the west coast was not envisaged as a possible zone of war. But the Japanese sent their invading land forces through the "impassable" jungles of the west coast as well as along the eastern shores of Malaya. Operating from bases in Thailand, Japanese troops landed at Singora and Patani above Malaya's east coast and struck across the Kra isthmus, severing communications between Malaya and Burma. These forces advanced down the level western shoreline. Crisscrossed with good roads that fed the rich rubber and tin regions, this terrain was admirably suited for a war of movement.

Simultaneously, Japanese shock troops landed on the east coast at Kota Bharu, a few miles south of the Thai frontier, capturing the airfield there on Dec. 9, 1941. Synchronized with the land attacks, a Japanese air blitz severely damaged the principal Malayan airfields, destroying more than half of the R.A.F. aircraft, which were surprised on the ground. The Japanese thus rapidly won air superiority at a low cost.

The Japanese then intensified their drives down both coasts. The column on the western shores, equipped for amphibious operations, waded easily through alternate expanses of swamplands and rice paddies and filtered through the tangled jungles. They outflanked the British armies around Alor Star, in Kedah province, compelled the British garrison to evacuate the naval base on Penang island, and seized a mining centre in Perak on Dec. 28. The eastern column, moving rapidly down the coast from Kota Bharu, captured the airdrome at Kuantan, 200 miles to the south, on Jan. 4, 1942.

Efforts to halt the Japanese torrent were unsuccessful. On Dec. 26, 1941, the British, in alarm, appointed Lt. Gen. Sir Henry Pownall to replace Gen. Sir Robert Brooke-Popham as commander-in-chief of British armies in Malaya. Japanese armies, meanwhile, reinforced with fresh troops, pressed their advance down the western Malayan shore. On Jan. 7, 1942, a tank thrust breached British lines along the Slim river and the invading armies poured through the resulting gap. Outnumbered and outmanoeuvred, the tiring British abandoned both Kuala Lumpur and Port Swettenham. Australian reserves thrown into action temporarily diverted a Japanese spearhead toward the inland jungles. But on Jan. 17 the Australians were hurled back and the enemy crossed the Muar river and advanced toward Kluang. The Japanese east coast armies based at Kuantan, receiving more reinforcements, took Mersing, a coastal point 75 miles from Singapore. The fall of Mersing and Kluang ended the hope of holding any portion of the mainland. A rearguard force was then assigned to fight a delaying action while the bulk of the British army retreated toward Singapore. On Jan. 31, the weary and footsore British crossed the Strait of Johore, and the causeway linking Singapore island with the mainland behind them was dynamited. The siege of Singapore had begun.

Numbering about 60,000 men, the British army was exhausted by seven weeks of constant fighting. On the other side of a shallow stream a half-mile wide was massed a Japanese force of about 100,000 troops. Singapore's defenses were pitiably weak. Only a few of its big coastal defense guns were turned around to face the invaders. Japanese air raids had disabled most of the other guns. Massing their artillery in a semicircle around the Strait of Johore, the Japanese opened a bombardment of the British position. On Feb. 8, the invaders, protected by an intensive land and air barrage, swarmed across the Strait of Johore, and within 48 hours they drove the British out of the northwestern half of the island. On Feb. 14, the Japanese closed in on the beleaguered naval base from three sides. Crowded into a small area already packed with terror-stricken refugees and under heavy air bombardment, their water supply destroyed, and no possibility of reinforcements, further resistance seemed hopeless. The Japanese terms for unconditional surrender were accepted on Feb. 15, and some 60,000 British imperial troops laid down their arms. The "impregnable" fortress of Singapore had been reduced in two weeks; the Japanese had won one of the most impressive victories in their history.

The rapid conquest of Malaya was effected by the use of un-conventional methods of warfare adapted to jungle climate and terrain. Instead of using frontal assaults in traditional World War I style, the Japanese soldiers split up into small parties, and the individual instead of the group became the fighting unit. The Japanese would slip into the jungle, often disguised in British or native costumes, filter through the gaps in the British lines, and would ambush the defenders from the rear. Under constant pressure of these harrying tactics, the British did not have time to consolidate their positions or to establish a stabilized defense line. The British troops had neither experience nor training in jungle fighting, and the swiftness of the Japanese advance precluded development of a technique of defense.

The attitude of the British colonial administration toward the natives was in no small degree responsible for the Malayan débacle. For example, at Penang the British authorities refused to evacuate anyone but Europeans; Malays, Chinese and Indians were left to fend for themselves. This shortsighted as well as ungallant action embittered many Malays; thousands of them turned against the British, joined the invaders and played an important role in fifth column activities.

A third factor was the want of foresight among Britain's military and colonial leaders in Malaya. British failure to grasp the meaning of total war was illustrated by the invariable reluctance of the military and the colonial administration to order their retreating forces to destroy property which might be useful to the enemy when captured. Thus, the stocks and harbour installations of Penang were reported to have fallen to the Japanese virtually intact. On one occasion, Malayan officials announced the British troops had completely destroyed the Kuantan airdrome before evacuating it. Several days later, the R.A.F. was sent over the airfield to bomb the hangars which were described as "undamaged." After the first month of fighting, the British troops applied the scorched earth policy with more vigour; but it was then too late. British strategy, unable to shake off the torpor of the "too little and too late" attitude, had been inadequate to save from the Japanese an indispensable naval base and the richest rubber and tin area in the world.

The Battle of the Philippines.—The paralyzing blow dealt to U.S. naval power at Pearl Harbor made defense of the Philippines impossible. The immobilization of the United States Pacific fleet dashed all hopes of getting reinforcements and supplies to the outnumbered American and Filipino troops in the islands. As a result of the attack on Pearl Harbor and the terribly effective raids on the American airfields in the Philippines, Japan immediately won both air and naval supremacy. Now practically immune from aerial or naval attack, the Japanese poured troops into the Philippines, and the conquest of the islands became certain. Thus from the very beginning of the battle of the Philippines, Gen. MacArthur's army was compelled to fight a delaying action which could end only in its destruction, in the hope of slowing the Japanese advance toward the richer prize to the south, the Netherlands East Indies.

MacArthur's forces, consisting of about 7,000 American and 75,000 Filipino troops, were concentrated chiefly on Luzon island, keystone of the commonwealth's defense system. This army had little mechanized equipment, only a few pieces of artillery and inadequate air support. The small U.S. Asiatic fleet, based at Cavite in Manila bay, gave the defending forces a semblance of naval support, but could never have been expected to offer successful resistance to the powerful Japanese naval forces operating in the Pacific.

Japanese planes launched the attack on the Philippines on Dec. 8, 1941, with a sudden and devastating raid on the principal airfields in Luzon and Mindanao, destroying the majority of the American craft on the ground.

Simultaneously with this air attack, Japanese troops landed on the island of Luzon and established three beachheads. American and Filipino units were able to smash the first Japanese landing parties at Lingayen gulf. But on Dec. 22, some 80,000 Japanese troops landed again in the Lingayen area from 80 transports, drove back the defenders and established secure beachheads. Another large invading force was also landed at a point 130 mi. southeast of Manila. Both of these armies launched a drive to converge on the Philippine capital and encircled MacArthur's heavily outnumbered units. MacArthur, however, eluded the trap by evacuating Manila which fell on Jan. 2, 1942, and withdrew his forces to the rugged and difficult terrain of the Bataan peninsula. Although the American-Filipino forces on Bataan were outnumbered by five to one, they were in an excellent position for a prolonged stand. The big guns of Corregidor fortress in Manila bay co-ordinated their fire with MacArthur's few pieces of artillery to help hold the enemy at bay.

The siege of Bataan began on Jan. 3. On Jan. 11, MacArthur skilfully parried an attack on his right flank, inflicting heavy losses on the Japanese. Another attempt to break through his lines was crushed on Jan. 19, and 10 days later headlong Japanese infantry assaults, against both flanks simultaneously, were broken up by fierce artillery fire. On Feb. 2, an invasion force which assembled opposite Corregidor was smashed by a sudden bombardment from the fortifications, while on Feb. 3, small U.S. motor torpedo boats zigzagged through Subic bay, torpedoing Japanese transports and attacking a warship in Manila bay.

Throughout February and March, MacArthur was able to hold his lines intact. But Japanese reinforcements kept pouring into the Bataan area, and it became evident that a major attack was in preparation. The position of the defending forces was serious. They were depleted by heavy casualties. Their battered equipment was reduced to a handful of tanks and a few cannon. Most of his American and Filipino units were exhausted by 12 weeks of constant fighting without air support. Their air force consisted of a few patched up pursuit planes. Even if they could get aerial reinforcements, there were no airfields in the small Bataan sector nor supplies of gas, bombs or ammunition. It was impossible for supplies to come through from the outside, since the American fleet remained immobilized as a result of the damage sustained in the Dec. 7 attack at Pearl Harbor.

Malaya and Java conquered, the Japanese determined to concentrate on the campaign in the Philippines. In March, Gen. Yamashita, the conqueror of Singapore, replaced Gen. Homma in command of the Japanese forces in the Philippines. Yamashita reinforced his troops with veterans of the Malayan and Dutch East Indies campaigns. In late March, he demanded the surrender of Gen. Jonathan Wainwright, who succeeded MacArthur after the latter was ordered to Australia. Wainwright refused and the battle went on.

Yamashita opened the campaign on March 28 with a heavy bombardment of American lines. Three days later, Japanese infantry units, covered by a barrage of shellfire from warships offshore, forced a breach in the Bataan lines. Tank units widened the gap, while Japanese aircraft harried Wainwright's rear lines, disrupting communications. Waves of Japanese shock troops poured through the crumbling defense lines on April 8 in the fiercest attack of the Bataan campaign. Wainwright's eastern flank collapsed under this smashing blow, and on April 9, the Japanese overran the entire Bataan sector. Of Wainwright's entire force of 43,000, some 36,000 were captured, killed or wounded in this battle. Wainwright himself, leading a force of 7,000 soldiers, marines and sailors and some 3,000 civilian refugees, escaped from the Bataan trap and fled to Corregidor. Although Wainwright was determined to hold out as long as possible in Corregidor, the position of the island fortress was hopeless. It was completely cut off from outside aid and was surrounded by a huge force. Without hope of reinforcement in men, guns, food or medicine, the exhausted garrison was subjected to nerve-shattering daily bombardments. Early in May, the Japanese attack on the fort began. Heavy guns emplaced in the mountains of Mariveles on the Bataan peninsula maintained a terrific bombardment of the "Rock," destroying the island's beach defenses. Japanese landing parties then stormed the fortress and took it in an all-out assault on May 6. After 26 days of siege, Corregidor's sick and starving garrison surrendered. With the fall of Corregidor, the Japanese had conquered the last principal point of resistance in the Philippines, although American and native guerrillas still fought in the more remote islands.

The Battle of the East Indies.—In the carefully designed pattern of Japan's strategy to establish a "co-prosperity sphere" in Asia—Tojo's equivalent to Hitler's "New Order" in Europe—the battles for Singapore and the Philippines were mere preliminaries. The major objective was the East Indies. Conquest of this rich archipelago would give Japan the largest oil wells and refineries in the far east, one-third of the world's rubber supplies, and the bulk of the world's quinine. The islands were also rich in copra, spices, coffee, rice, timber and other tropical products.

Japan's plan was (1) to effect landings on the outer islands—Netherlands New Guinea, Ceram, Celebes and Borneo, (2) then strike at the inner chain—Timor, Flores, Sumatra and Bali, and (3) then launch their final all-out assault against fabulous Java, richest island of all. In preparation for this campaign, the Japanese massed a huge fleet of troop transports, smaller warships and aircraft carriers in the waters of French Indo-China. Since the fighting power of the Anglo-American fleets was taxed to capacity in the Philippines, Malaya and Burma, the main burden for the defense of the Netherlands East Indies rested on the Dutch.

The Dutch army consisted of about 100,000 native and white troops, the bulk of whom were concentrated in Java, nucleus of the Indies defensive system. Its air force, small but efficient, consisted of about 200 bombers and 200 fighter planes. The army, however, was woefully weak in mechanized equipment. The Dutch East Indies navy, comprising four cruisers, six destroyers, 18 submarines and a large number of motor torpedo boats, was joined by the United States Asiatic fleet and by British units; but their combined strength proved inadequate to hold the sea routes against the invaders. Because of the limited strength of their seapower in the Pacific, the allies concentrated their efforts on protecting Java. After the Pearl Harbor catastrophe, the Dutch decided on an aggressive naval policy. The small Netherlands naval forces carried the war to the Gulf of Siam and in the first week of fighting sank at least six troop transports. They kept up this astonishing average throughout the first six weeks of fighting. But losses suffered by the small Dutch navy were irreplaceable, and after two months of war its effectiveness noticeably diminished.

Japan launched its invasion of the outer rim of the East Indies archipelago on Dec. 17, 1941, with landings on Sarawak, a British protectorate on the northwest coast of Borneo. The British, anticipating the attack, had ordered the destruction of Sarawak's oil fields and had then withdrawn their garrison, which was too small to put up any effective resistance. The initial Sarawak skirmish was followed by Japanese landings on the Philippine island of Mindanao and by the occupation of the port of Davao on Dec. 20. The conquest of Davao gave the Japanese command of the Celebes sea, and a base from which they could extend their operations to the channels controlling the approaches to the outer islands. Four days later, Japanese troops landed at Kuching, capital of Sarawak, thus occupying the entire protectorate.

The Japanese then directed their attention to the Dutch islands. On Jan. 10, 1942, two convoys moved southward from newly conquered Davao. One landed troops on Tarakan, oil refining island off the east coast of Borneo. The other landed forces at Manado, chief town of the Minahassa peninsula of Celebes. The Dutch fought back furiously. Shore batteries sank two Japanese destroyers off Tarakan, while Netherlands bombers damaged two cruisers. The defenders of Tarakan were overwhelmed on Jan. 12, but not before they had robbed the Japanese of the fruits of their victory by destroying all the oil wells and refineries on the island. After 11 days of fighting, marked by stubborn Dutch resistance, the Japanese won control of the peninsula.

After securing a foothold on Celebes, Japanese planes were sent to "soften" allied resistance in New Guinea and the Bismarck archipelago by heavy bombing raids. Japanese troops then landed in these islands on Jan. 23, and quickly occupied Rabaul in New Guinea and Kavieng in New Ireland. This thrust extended Japanese power far to the east and brought them to within easy striking distance of Australia. The extension of the Japanese tentacles eastward also perilled the allied supply routes to Java and Australia. Japan now had footholds on both the western and eastern fringes of the outer islands. But Japanese efforts to drive a wedge through the centre were temporarily halted when an American-British naval force trapped a large convoy in the Strait of Makassar, a narrow sea inlet between Borneo and Celebes, and sank at least one-third of the Japanese ships after a violent three-day battle, Jan. 24–26. (See *Naval Warfare in the Pacific*, p. 785.)

This blow, however, proved to be only a temporary setback. Even while this naval battle was going on, the Japanese troops landed at Balikpapan in Borneo and Kandari in Celebes. On Jan. 29, new enemy forces established beachheads at Pemangkat on western Borneo and captured Pontianak on Feb. 1, thus broadening their foothold on the western coast of Borneo. On Jan. 31, another force invaded Ambon (Amboina). This rapid investment of key points on the outer rim gave the Japanese air bases from which to strike at Java, Dutch stronghold. On Feb. 3, a force of 70 Japanese planes struck at Soerabaja, principal Dutch naval base on Java, severely damaging the base and crippling the adjacent airfields. Japanese air raiders then fanned out over Sumatra, Java and Dutch Timor, smashing at Dutch airdromes. Outnumbered by the invading air fleets, the allied air forces were unable to halt the Japanese and were slowly pared down by the process of attrition.

Japan's drive to conquer the outer islands was resumed on Feb. 10. A new convoy steamed through the narrow Straits of Makassar and landed a force at Makassar, on the southeastern finger of Celebes. Simultaneously, Japanese forces in Borneo drove to the south, capturing Bandjermasin on Feb. 12. The seizure of these two points gave the Japanese complete control of the Straits of Makassar, and airfields subsequently established there were within bomber range of Soerabaja, only 300 mi. away.

The invaders then launched a concerted attack on Sumatra. On Feb. 14, some 700 Japanese parachute troops alighted at Palembang, important oil centre in southeastern Sumatra, but were promptly mopped up by the defending garrison. Undismayed by the failure of the paratroop offensive, the Japanese landed in force the next day near Palembang. Although outgunned and outnumbered, one Dutch force held off the Japanese invaders while demolition squads in the rear blew up all wells, storage tanks and refineries before it withdrew. The Japanese proceeded to establish footholds on the southern tip of the island and won control of the western shores of Sunda strait, only a few miles from Java itself. Moving in from their bases on Borneo and Celebes, the Japanese, on Feb. 20, occupied Portuguese Timor.

Portuguese protests against this invasion were politely ignored. On the same day another Japanese detachment invaded Bali. Separated from Java only by a narrow channel, less than a mile across, Bali fell on Feb. 23 and Java was between the jaws of a Japanese vise. The invaders meanwhile proceeded to mop up the remnants of Dutch forces on Sumatra, Bali, Borneo and Celebes, and then massed warships, troop transports and planes on the newly won bases in these islands for the final drive on Java.

The American and Dutch commands decided to risk their combined fleets in a desperate gamble to break the enemy ring around Java. On Feb. 27, the smaller allied fleet challenged a large convoy of Japanese troopships escorted by strong naval detachments. After a two-day running battle, nearly the entire allied force was destroyed. This staggering defeat sealed the doom of Java. The enemy convoy got through safely, and the Japanese invaded Java on the night of Feb. 28. An estimated five divisions, numbering between 60,000 and 75,000 men, had been landed during the five-day period following the initial onslaught. This force separated into three spearheads, aimed respectively at Batavia, the capital, Bandoeng (Bandung), the Dutch military headquarters, and Soerabaja, the naval base. Protected by overwhelming air support, the triple-pronged drive moved with unexpected speed. Batavia fell on March 5 and the defenses of Bandoeng collapsed on March 7. By March 10 Soerabaja had fallen, and virtually all resistance in Java had ceased. The Japanese claimed that 98,000 allied troops, including about 5,000 Americans, British and Australians, were taken prisoner on Java.

The Dutch and Indonesian troops fought with courage and stubbornness, but they were no match for the invaders. The Japanese had numerical superiority, better-trained armies, more armoured equipment and a smoothly-working communications system that permitted a steady and abundant flow of supplies to reach their armies, and above all, naval and air supremacy. Allied failure to break the Japanese naval blockade and to get supplies into Java was regarded as one of the factors responsible for the loss of the Netherlands East Indies. Some Netherlands Indies officials, complaining bitterly over the delay in sending aid to Java, asserted that 1,000 additional planes would have turned the tide of battle in the southwest Pacific in favour of the allies.

The Burma Campaign.—The Japanese invasion of Burma did not get under way until Jan. 15, 1942, five weeks after the Pearl Harbor attack. Although the position of Burma was a potential threat to the Japanese flank in Malaya, the British command was unable to mass enough men and material in this theatre to exploit this situation. Furthermore, British strategy was not geared to wage an offensive war. Thus, the Japanese were enabled to ignore the Burma front until their footholds in Malaya were solidly established.

Nevertheless, Japan had not overlooked the possibility of an eventual drive into Burma. While the struggle for Malaya was still in its initial stages, the Japanese poured a steady stream of reserves and supplies into their Thailand bases. When it became evident that Japanese forces in Malaya were adequate to bring that campaign to a successful conclusion, the bulk of the reserve divisions in Thailand were turned against Burma. Japanese bombers then opened the way with heavy raids on British airfields at Rangoon and Moulmein, following the Japanese concept that control of the air was an essential factor in land operations.

On Jan. 15, 1942, a Japanese land column moving from Thailand struck across the frontier, penetrating Tenasserim province, the narrow Burmese "appendix" with a 600-mi. coastline on the Bay of Bengal. By Jan. 18 this column had occupied Tavoy, thus slicing Tenasserim through the middle. Another column to the north then marched across the Thai frontier in a push toward Paan, a small town on the east bank of the Salween river about 40 mi. north of Moulmein. Threatened by this flanking movement, the small British garrison in this area fell back toward Moulmein and the Salween. The Japanese objective was to envelop Moulmein in a pincers movement and thus win control of the coastal areas of Tenasserim. This was temporarily blocked, however, by the brilliant defensive operations of the American Volunteer Group, nicknamed the "Flying Tigers." This small but superbly trained group of American fliers, who had volunteered to fight in China's air force, was ably aided by British pilots. The A.V.G. and the R.A.F. fought gallantly against odds of five to one. But lacking reinforcements and facilities for replacements, this combined air force was never strong enough to compensate for the weakness of the defending ground armies, outnumbered and outgunned by the invaders.

The Japanese launched their drive against Moulmein on Jan. 30. They converged on the city from three sides and occupied it on Jan. 31, after the British withdrew in haste to escape encirclement.

The capture of Moulmein furnished the Japanese with a base for an offensive against Rangoon, 200 mi. away by the winding coast roads. Meanwhile, the northern column at Paan, after two weeks of seesaw fighting, was able to secure a bridgehead on the western banks of the Salween river. The army at Moulmein then swung northward through Martaban, about 20 mi. away, and joined the northern column at Thaton, a rail junction. Again, on Feb. 15, the British had to retreat westward to escape encirclement, to a new line at the Bilin river.

In bridging the Salween, the Japanese had ousted the British from the strongest natural defense position in southeastern Burma. The Salween was a deep stream three miles wide at its mouth; the Bilin was shallow and narrow and afforded few natural barriers for defensive operations. Moreover, the British were fast tiring, while the Japanese were receiving fresh reinforcements. On Feb. 17, the Japanese struck anew with a concerted air and land attack against the Bilin river line. The weak British defenses collapsed; once more the British imperial armies retreated to the west, this time to the Sittang river. It was now clear that Rangoon was doomed; the civilian population fled the city, and on Feb. 25 British authorities set fire to the city. Everything of possible use to the Japanese, including millions of dollars worth of American war supplies which had been destined for China, went up in smoke.

The jaws of the Japanese pincer were closing on the Burmese capital. A British force at Toungoo, 102 mi. to the north, struck at the enemy flank in a successful diversion which delayed the closing of the trap, and enabled the Rangoon garrison to withdraw and to join British armies now concentrating in the Prome area. Rangoon itself was occupied by the Japanese on March 8. The thorough destruction of the city showed that the British were learning a bitter lesson—that the scorched earth policy had to be applied firmly and with decision, or the advantage would accrue to the enemy, as in Malaya.

The fall of Rangoon jeopardized the allied hold on the Burma road, over which flowed the major portion of allied war supplies to China. Early in January, the Chungking government, alarmed at the speed with which the Japanese force had penetrated nearby Malaya, implored the British to permit Chinese divisions to join in the defense of Burma. The British command temporized, fearing that the Burmese, opposed to the entry of Chinese troops into the country, would revolt. Chungking's offer was tentatively rejected. But when the Japanese swept into Moulmein, the British command underwent a change of heart. In February, one Chinese brigade appeared in the Shan states in upper Burma, to which they had marched on foot from Yunnan province, 1,000 mi. away. But it was not until after the fall of Rangoon that Chinese armies were "allowed" to share in the defense of Burma. On March 19, Gen. Joseph W. Stilwell, United States military adviser to Chiang Kai-shek, was placed in command of the Fifth and Sixth Chinese armies in Burma.

The entire Japanese land force in Burma was believed not to have exceeded four or five divisions. The air force probably numbered 450 planes in all. Opposing them in the first half of the campaign were two British imperial divisions, later bolstered by a crack division of the Indian army, and a combined R.A.F. and A.V.G. force of less than 150 planes. Although the two Chinese armies—each equivalent to a Japanese division in numbers—had only a fraction of the firepower of a Japanese division, they were composed of battle-tested regulars. The British imperial divisions, however, were spotty in composition. Many of the units consisted of tough veterans from England, who fought with courage and skill; but many more were made up of raw native levies captained by volunteers from British colonial firms with no military training or experience, let alone knowledge of jungle warfare. Around Moulmein, the Japanese staged imitation attacks by tossing exploding firecrackers near the defenders' positions; terrorized, the native battalions fled in panic.

The unfriendly attitude of the native Burmese population to the British colonial administration was another drawback. Japanese propaganda broadcasts urged the Burmese to join the Japanese in freeing the country of its British "despots" and in making Asia "safe" for Asiatics.

Enemy air raids over British airfields increased in intensity as the second phase of the Burma campaign opened in late March. The air force of the allies suffered losses in planes and equipment which were irreplaceable, and their ground forces were thus deprived of air support. Seizing the initiative, the invaders hammered the British units at Prome on the Irrawaddy river and the Chinese armies at Toungoo on the upper Sittang. Battered by a heavy aerial attack, and outflanked by a Japanese column which cut the communications above them, the Chinese withdrew to the north on March 25. At the same time, a Japanese flanking manoeuvre at Prome compelled the British to abandon Prome on April 2. By the middle of April, the British had fallen back to Magwe, the last important oil centre held by the allies in the far east. The British blew up the Magwe wells, set fire to the storage tanks and refineries and abandoned the city on April 16. A Japanese flying column, however, had skirted around Yenangyaung to the north and cut off the retreat of the British force. At this crucial moment, the Chinese near Toungoo fiercely attacked the Japanese column from the rear, while British tanks and infantry formed a flying wedge and crashed through the Japanese lines in a frontal assault; but neither the Chinese nor the British possessed sufficient firepower to establish a stable defensive front. After this diversionary manoeuvre, the Chinese retired to a point 75 mi. below Mandalay and the British fell back to the Chindwin valley in preparation for a full retreat to India.

While the British and Chinese forces were fighting a desperate rear-guard action in eastern Burma, the Japanese opened another front in west central Burma. The allied position was now hopeless. The British armies, hammered and harried in weeks of unremitting battle, had been whittled down to mere skeleton forces. The Chinese, lacking adequate arms, had suffered severe casualties.

The third Japanese drive, launched on April 15 from the Thailand base of Chiengmai, surged into the southern Shan states and engaged a Chinese army which had been immobilized there for three months. But this army was spread too thinly over a 400 sq.mi. area to offer serious resistance. Heavily bolstered with armour and planes, the Japanese pierced the tenuous Chinese line at Loikaw, circled its eastern flank at Taunggyi and reached Lashio, the Burma road terminus, on April 28. The Japanese columns driving up the Irrawaddy entered Mandalay on May 1. Chinese armies north of Mandalay, however, fought a holding action despite a Japanese flanking manoeuvre from the east, and helped cover the retreat of the British up the Chindwin valley. In ensuing engagements, the Chinese were cut to ribbons, as the remnants of two British and one Indian division sacrificed their equipment and staggered to safety across the Indian border, after a gruelling retreat through the mountains of western Burma.

The Battle of New Guinea.—New Guinea and the nearby islands of New Britain, New Ireland and the Solomons, held a prominent position in the Japanese strategy for conquest of the southwest Pacific: (1) they were important as stepping-stones for a possible thrust into Australia and (2) they were bases from which Japanese warships could halt or impede the flow of U.S. convoys bearing war supplies to the far east. Australia would be isolated if the Japanese could cut the sea lanes linking her with the United States, and the United Nations would lose a key base for future operations against Japan.

On Jan. 23, 1942, the first enemy thrust into this island cluster was launched. Japanese transports, under heavy warship and plane convoy, landed troops on New Britain, New Ireland and the Solomons, meeting bitter resistance. The invaders rapidly consolidated their newly won positions, repaired harbours and constructed airfields, and then rested to await Tokyo's command to push farther east.

After the collapse of Java, the push to the southwest Pacific was resumed. On March 8, a Japanese fleet landed troops at Salamaua and Lae, neighbouring ports on the northeast coast of New Guinea. Forty-eight hours later, they made a landing at Finschhafen, a small harbour 65 mi. up the coast from Salamaua. The Japanese met no resistance from the shore (the small Australian garrison had been evacuated some weeks before), but they were heavily attacked by U.S. and Australian air forces. Japanese bombers in turn raided Port Moresby, main allied air base, on the under side of New Guinea. A Japanese invasion armada tried to circle the eastern tip of New Guinea in an attempt to land at Port Moresby, but bomber attacks compelled it to retire before reaching Milne bay.

Elimination of Port Moresby became Japan's first objective in New Guinea. On March 19 a force trained in jungle warfare started to move across the island in a drive against Port Moresby. They sloughed through roads a foot deep in mud and climbed the treacherous, vine-tangled slopes of the Owen Stanley mountains, whose major peaks were more than 13,000 ft. high. The Japanese reached the Markham valley by May, but they were bogged down by rains that flooded the mountain gaps, and were compelled to return to their bases at Salamaua and Lae. Japanese scouts meanwhile had found a better and shorter road—a narrow jungle path linking Buna, a shore point 140 mi. southeast of Salamaua, with Port Moresby. The Japanese then made fresh landings at Gona, a tiny mission centre in northern Papua, and also seized neighbouring Buna, an outpost composed of six houses. A small Japanese force of about 2,500 then started over the Buna road toward Port Moresby. Japanese tactics were similar to those used in Burma and Malaya. Groups of snipers filtered silently through the matted jungles to ambush the Australian force from flank and rear. Constantly threatened with encirclement, the defenders retreated. By Sept. 1 the Japanese had battled their way over the Owen Stanley mountains and were moving rapidly down the southern slopes of the range in pursuit of the Australians. At the end of three weeks the invaders had marched through Kokoda and Kagi, two tiny mountain villages, and were nearing Port Moresby.

But they had underestimated the difficulties of shipping supplies and food through New Guinea's jungles. The advance units had pushed ahead too quickly and their supply carriers could not catch up with them. Exhausted by the rapid pace of their advance, by lack of food, by dysentery and malaria, the Japanese were obliged to halt their drive at positions only 32 mi. from Port Moresby.

On Sept. 25 the Australians launched their first major offensive in New Guinea. The tactics for this campaign were planned by Gen. MacArthur; Gen. Thomas Blamey of the Australian army was land commander. Determined not to commit the error of outrunning their native supply carriers, they pressed forward with caution and set up supply dumps in the rear. On Oct. 5, Australian soldiers took Kagi. A month later, on Nov. 2, they recaptured Kokoda.

The fatigued Japanese forces then regrouped in positions within easy supply reach of their bases at Buna and Gona. But their plans for a strong stand were disrupted by the arrival of thousands of American soldiers. Some of these fresh forces had crossed the rain-drenched mountain gaps along corduroy roads hacked out of the jungle by allied engineers. The majority, however, had been flown to New Guinea from Australia in a great fleet of air transports.

The allied command solved the difficult logistical problems involved in feeding and supplying these relatively large forces by organizing the supply system on a smoothly functioning land and air basis. Native carriers alternated with light motorized equipment—such as "jeeps"—in shipping supplies overland while a fleet of transport planes flew equipment to the advanced outposts. The movement of supplies by air was facilitated by the discovery of a natural landing strip near Buna.

The Japanese were then treated to a bitter dose of their own jungle tactics. Australian and American jungle "specialists" penetrated the Japanese lines while infantry supported by tanks and mortars hammered Japanese flanks into retreat. The Americans and Australians effected a junction and then closed in on Buna and Gona. The Australians entered Gona on Nov. 24, while the Americans advanced to positions a mile from Buna.

The fighting around Buna was of the utmost intensity. No quarter was asked or given. In a last-ditch stand at Buna beach, the Japanese entrenched themselves in pill-boxes constructed of palmetto logs. These crude fortifications, with walls as much as seven feet thick and bristling with machine guns, discouraged frontal assaults since small arms and mortars were ineffectual in this new kind of trench war; the allies brought up 13-ton tanks which eventually destroyed this fortification system. The Japanese resisted fiercely. One Japanese pill-box with 100 men held out for 90 minutes under the combined assault of three tanks which poured 150 shells into their palmetto refuge. The Australians had encountered similar difficulties at Gona.

Australian and American troops captured Buna village on Dec. 15. Both forces then mopped up enemy units still holding out in nearby Buna Mission.

The Papuan campaign came to a close on Jan. 22, 1943, with the capture of Sananda Point. The allied forces virtually annihilated the forces of Gen. Tomitaro Horii, estimated at 15,000 men. In the final drive on Sanananda, 725 Japanese were killed; only 117 surrendered. The allied losses in the Papuan campaign were about half the Japanese casualties.

Although the Japanese had lost Papua, they still held strong points on New Guinea island at Salamaua and Lae in the province of Northeast New Guinea.

The Solomon Islands Campaign.—On Aug. 7, 1942, United States marines landed in the southern Solomon islands in the first genuine allied offensive in the Asiatic theatre of operations since the outbreak of war.

The Japanese had invaded the Solomons about six weeks after Pearl Harbor; their purpose was to establish air and naval bases on these tropical isles from which Japanese aircraft and warships could cut the flow of ship-borne war supplies from the United States to Australia. The American offensive was designed to thwart Japan's plans; the United States intended to establish footholds in the Solomons for eventual offensive operations against the enemy's naval strongholds at Bougainville and Truk farther north.

Well organized teamwork between the United States ground, sea and air forces facilitated the landings in the Solomons. Warships laid down heavy barrages on the islands to screen the approaching troop transports. Carrier-based planes and army bombers softened the Japanese bases. A division of marines, supported by special shock battalions, then streamed toward the beaches in self-propelled steel barges. They rapidly secured a beachhead on Guadalcanal island, captured an almost complete Japanese airfield there, and seized the smaller islands of Tulagi, Gavutu and Tanombogo. The first Japanese units on Guadalcanal were subdued easily, but those on Tulagi and Gavutu fought desperately. The marines were compelled to kill the entire garrison of 1,200 on Gavutu and 600 on Tulagi. Not one surrendered.

The marines won their initial footholds with relative ease and at low cost in casualties. If the Japanese were taken by surprise by the operations of the marines, the American naval forces were completely stunned by the fierce Japanese counterblows. On the night of Aug. 8–9, a Japanese cruiser force slipped into the channel between Guadalcanal and Tulagi, caught allied naval patrols off guard, and sank four allied cruisers. This defeat, one of the worst in the Pacific war, was clear proof that the Japanese did not intend to relinquish their hold on the islands without a stiff fight. (See *Naval Warfare in the Pacific*, p. 785.)

The Japanese then launched a spirited land, sea and air offensive to dislodge the marines from the Solomons. Big bombers, based at airfields in the northern Solomons and at far-off Rabaul, subjected the American beachhead on Guadalcanal and Henderson field to daily bombings. Japanese naval units and submarines continually raided American supply ships. At night, Japanese soldiers were landed on the fringes of the American positions, to harry the marines continuously. But the marines clung tenaciously to their jungle beachhead; tanks patrolled the beaches in search of Japanese landing parties while "tommy-gunners" cleaned out snipers and mopped up isolated enemy jungle nests. On Aug. 20

an attempted Japanese landing on Guadalcanal was broken up, with the slaughter of all but 30 of a Japanese force of 700 men. Three weeks later the marines repulsed three more attempts to storm their positions on Guadalcanal. Hundreds of the invaders were chased into the shark-infested waters, although many escaped into the jungle to harass the American rear lines.

Of invaluable aid in helping the marines cling to their toehold on Guadalcanal was the small but efficient air force based at Henderson field. Enjoying qualitative if not quantitative superiority, American fighters and bombers accounted for more than 150 enemy planes in the first five weeks of battle, shooting them down at the rate of four and five to one. The bomber wing also gave Japanese warships and troop transports in the Solomons a terrific pounding. Torpedo planes and long-range bombers sent at least 20 ships to the bottom in the first six weeks. Many Japanese warships were badly damaged by American bombs, while the shores of Guadalcanal and Tulagi were strewn with the burned out shells of Japanese troopships that had been set afire by accurate American bombings, and beached.

Yet the Japanese, who had men and ships to spare, kept on coming. Their naval force was larger, their lines of supply shorter. By Oct. 15 Japan's numerical superiority in men and ships began to tell. Japanese forces landed in broad daylight for the first time on Guadalcanal, only 15 mi. from the American lines. Hitherto, strong American units and constant air patrol made such ventures virtual suicide. But the U.S. task force, its strength depleted by the losses in the battle of the Savo sea and by the departure of damaged ships to ports of repair, was hard-pressed to hold its own. Heavy Japanese guns were also landed and brought close enough to shell the United States beachhead. The position of the marines became critical. Although they had received small reinforcements of regular army troops, replenishment of supplies was uncertain in view of the constant Japanese naval and air patrol. Toward the end of October the Japanese launched a new and heavier land, sea and air attack on Guadalcanal. On land, the army and marine forces repelled the ground attacks. Japanese bombs caused some damage to Henderson field, but marine and naval aviators retaliated with bomb-hits on two cruisers.

In November the Japanese massed for an all-out attempt to smash the American grip on Guadalcanal. This time it was another story. Many of the damaged American warships had been repaired and the strength of the task force in the Solomons was increased by new units. More supplies were reaching the Guadalcanal garrison, army and marine reinforcements had landed to replace the original forces, worn by 12 weeks of constant fighting, and large air reinforcements were on the way.

The sea battle for control of the Solomons was joined Nov. 13. After three days of violent action, the Japanese were decisively defeated. While the naval engagement was still in progress, the marines wiped out half of a Japanese force of 1,500 men in a battle at the jungle fringes of Henderson airfield.

The decisive naval victory helped to consolidate the American ground positions on the Solomons. The crisis had passed, and the army and marines speedily consolidated their positions for the next step—eviction of the remaining Japanese on Guadalcanal. Still determined to hold the Solomons, the Japanese reinforced their airdromes at Reketa bay on Santa Isabel island, and Buin on Shortland island, and established a new air base on Munda in the New Georgia group. These three bases brought Japanese fighter and bomber planes within easy striking distance of Guadalcanal.

The expertness of the Japanese soldier in jungle technique made him a tough fighting man, difficult to beat. His personal courage was great; he would advance into marine cross-fire despite the certain death that faced him. At jungle warfare, he admitted few equals and no superiors. He was crafty and skilled in camouflage. Many of the Japanese smeared their hands and faces with green paint and wore capes of coco-nut husks to blend with their surroundings. Snipers hid themselves in palmetto fronds; they lashed themselves to trees with belts to steady their aim. These methods of attack, though new to the marines, were soon mastered. Such fanaticism was of limited usefulness in certain types of offensive operations, but refusal to withdraw when this was justifiable resulted in extremely heavy casualties. Major General Vandegrift, commander of the marines in the Solomons, estimated that 7,000 Japanese were slain in the first four months of fighting. Only 700 marines were reported killed in this same period. By Feb. 10, 1943, all Japanese in this area had been either annihilated or captured.

The China Theatre of War.—After Pearl Harbor, war supplies that normally would have gone to the Chinese armies were siphoned off to the allied forces desperately striving to halt the Japanese tide of conquest in the Pacific. Although British and

American supplies shipped to China were never adequate, they were substantial and helped considerably to keep Gen. Chiang Kai-shek's armies fighting effectively. The scarcity of allied shipping also complicated the problem. Chungking, confident that Britain and the United States would divert the Japanese attacks, made no changes in its basic strategy—to fight a grim war of attrition. The stubborn fighting spirit of the Chinese continued to be a great contribution to the allied cause. Their refusal to admit defeat after five years of war compelled the Japanese to tie up at least one-third of their forces in China.

At the beginning of 1942 the Japanese military force in China, including the armies of the various puppet regimes, numbered between 600,000 and 800,000. This force was well equipped with tanks, heavy artillery and planes. The Chinese had 5,000,000 men in the field and about 15,000,000 men in reserve units or in training camps. In addition, a guerrilla force estimated at 800,000 men harassed Japanese communications while another 600,000 regular army troops, organized into self-sufficient units, also operated in the Japanese spheres of influence. These vast armies, however, had few planes, little heavy artillery and hardly any motorized equipment. Despite these serious handicaps, the Chinese armies killed or wounded about 1,000,000 of the enemy in the first five years of war with Japan. China's own casualties, according to Chungking estimates, amounted to 3,000,000 soldiers and civilians. But her reservoir of manpower was five times greater than Japan's.

Despite their poor equipment, China's armies proved in Jan. 1942 that they could win battles on a shoestring. Barely two weeks after the outbreak of the Pacific war, the Japanese launched a new drive to take Changsha, a Chinese stronghold astride the important railway linking Hankow and Nanking. The Japanese wanted this road to shorten land communications with their bases in Thailand and French Indo-China. Two previous attempts to dislodge Chinese armies from the city had failed. This time, the Japanese massed an army of 100,000 veterans for the third trial.

The Chinese dodged the initial Japanese frontal assault against their Sinchiang river lines on Dec. 23, 1941, and let the Japanese roll through to Changsha's outer defenses. On the night of Dec. 31, the Japanese attacked the peripheral defenses of Changsha. After three days of battle, one Japanese column succeeded in piercing Changsha's northern walls but was repulsed before it could consolidate its gains. Meanwhile, the Chinese columns outside the Changsha battle area formed a giant pocket about the Japanese army. The Japanese army besieging Changsha found itself besieged in turn. Caught between heavy cross-fire, the Japanese regrouped in wedge formation, broke out of the trap on Jan. 15, 1942, and fled to the north. Their casualties were heavy. Chungking said 57,000 Japanese were killed or wounded in this battle alone. Tokyo's version of the Changsha battle was that the Japanese forces had withdrawn from Changsha after "accomplishing their objectives."

But Chinese elation over the results of the Changsha battle was dampened by the rapid deterioration of the British defenses in Burma. The fall of Burma would give Japan control of the Burma road, thus depriving China of its only good overland supply link with the allies. In late February two Chinese armies sent into Burma made a futile effort to help the British save the day. The British were driven into India, the Chinese armies were thrown back across the Burmese frontier into Yunnan province, and on April 29 the Japanese entered Lashio and severed the Burma road.

The Japanese capture of Lashio and the cutting of the Burma road virtually isolated China; the few alternate roads to India were mere camel paths in comparison. The road to the soviet union via Turkestan was still functioning, but Russian war supplies to China had dwindled since the German invasion of Russia. The United States air force ran a shuttle service from India to China, but transport planes then could not compete with motor caravans in freight capacity.

After the battle of Lashio a Japanese spearhead swung up the Burma road, forded the Wanting river and crossed the frontier into Yunnan province on May 5, 1942. The Japanese pursued the Chinese to Chefang, about 20 mi. east of Wanting, and then halted.

Two weeks later the Japanese started an offensive into the still unconquered provinces of southeastern China. Apparently, the motive behind this new drive was supplied by Gen. "Jimmy" Doolittle's spectacular raid on Tokyo, on April 18, a month before. In describing the raid, President Roosevelt said that Doolittle's raiders had been based at "Shangri-La." Convinced that "Shangri-La" was located in Chekiang or Fukien province, Japanese bombers launched an intensive series of attacks on airfields there.

The land drive got under way May 19. Four columns based near Hangchow bay struck southward along the Chekiang-Kiangsi railway leading to Kinhwa, 100 mi. away. Nine days later, on May 28, the Japanese occupied Kinhwa, seized the airfield at Chuhsien (which was within bombing distance of Formosa) on June 7, and occupied Chuhsien on June 10. The loss of the railway increased China's difficulties of getting supplies from the coast. Other Japanese columns driving from the east and north threatened what remained of the Chekiang-Kiangsi railway. The Japanese wanted this road in order to establish a continental rail haul from Chosen all the way to Singapore.

No sooner had the Japanese gained control of the Chekiang-Kiangsi line than they moved west to sever the Kiangsi-Hunan line, a feeder to Chinese forces operating in the Changsha zone. Two columns converged on Feng-cheng; unable to break through the Chinese lines there, they abandoned their attempt to reach the rail line and withdrew to the north.

By the middle of July the Japanese offensive in southeastern China had come to an abrupt halt. The Chinese embarked on a counteroffensive. Japanese forces were thrown out of their positions southeast of Foochow, and on Aug. 19 the Chinese recaptured the walled port of Wenchow. Another Chinese drive along the Chekiang-Kiangsi railway resulted in the recapture of Chuhsien and Lishui on Aug. 29. The small American air force in China, which included many members of the former American Volunteer Group, provided the attacking Chinese armies with invaluable, although limited, air support in the new drive. By the end of August the Chinese had dislodged the Japanese from a 100-mi. stretch of the railway.

In the fall of 1942 the armies of both sides in the Chinese theatre of war marked time. Chungking sources explained this lull in activities as an indication that large Japanese armies were being withdrawn from China in preparation for an attack on Russia's Siberian provinces. These sources added that the Japanese were waiting for a decisive German victory in the west before launching an attack against Siberia. Russia, however, failed to collapse.

As the year 1942 came to a close, the Chinese were still very much in the fight despite the loss of the Burma road and their desperate supply problem. They had reoccupied many areas formerly held by the enemy, through their own efforts and because, in many cases, the Japanese were compelled to withdraw troops for fighting in other zones of the widely extended Pacific battlefront. The Japanese, however, still held the main coastal areas and the majority of the railroads and principal highways.

One cheering prospect for China was the extensive activity of the U.S. air forces in China. Ranging far and wide, the big U.S. bombers hammered military objectives in such Japanese-held centres as Hankow, Canton and Hongkong. For the first time in five years, the Japanese no longer swept the skies over China unchallenged.

Action in the Aleutians.—In June, 1942, a Japanese force landed on the outermost islands of the Aleutians and brought the war to the Pacific shores of the western hemisphere. The attack on the Aleutians was launched simultaneously with the Japanese sea and air offensive against Midway island. Originally, it was intended merely to divert American naval strength to the Bering sea, and thus prevent units of the U.S. Pacific fleet from outflanking the fleet of Japanese warships heading for Midway. Once established in the Aleutians, however, the Japanese did not leave.

Strategically, Japanese operations in the Aleutians had great nuisance value. This invasion compelled the United States to divert men, ships and planes needed in other theatres of war to the Alaskan seas to prevent further Japanese incursions. The islands also threatened the tenuous communications link with Russia via the Bering straits. In case Russia were drawn into the Pacific war, Japan could easily intercept American supply ships from these outposts.

The invasion of the Aleutians started June 3, when planes from a Japanese carrier raided Dutch Harbor, U.S. naval post on Unalaska island. This manoeuvre screened the landing of Japanese troops at Attu, Agattu and Kiska islands. Attu and Agattu were barren rocks protruding from the Arctic waters. Kiska was larger, had fair possibilities for anchorage and some relatively flat areas for construction of an airfield. The Japanese met no opposition, as the three islands were virtually unoccupied save for a few navy weathermen stationed there.

The United States made no major effort to dislodge the Japanese from their Aleutian footholds during 1942. After early alarms had died down, it was estimated that the Japanese had no more than 3,000 men on the three islands, and it appeared unlikely that they could extend their conquests to the Alaskan panhandle. However, a large enough naval and air force was sent to Alaskan bases to make life miserable for the Japanese. Operating in close coordination, American submarines struck at Japanese warships and transports anchored off Kiska while army and navy planes subjected the invaders to a terrific overhead pounding. These attacks were so effective that the Japanese lost 10 warships, including six or seven destroyers, in the first 90 days of the systematic sea and air raids. In addition, 24 other vessels were damaged in this same period. On Sept. 1 the United States forces moved closer to the Japanese bases by occupying one of the Andreanof islands, midway between Dutch Harbor and Kiska. A month later, the United States navy reported that the Japanese had abandoned Attu and Agattu.

Why the American forces had not reoccupied Kiska was not clear at the end of 1942.

III.—THE RUSSIAN THEATRE OF WAR

January to May, 1942.—In Jan. 1942 the Russian armies were on the offensive all along a snowbound battlefront 2,000 mi. long. In the north, a German drive to encircle Leningrad had been turned back at the gates of the city. In the central zone, the Germans had lost the battle of Moscow and were in retreat. In the south, reich troops were falling back west of Rostov. The Germans were astounded at the "resurrection" of the Russian armies. As late as Oct. 3, 1941, a German press statement had said the Red army was "crushed." The Germans had terribly underestimated the Russian fighting ability and did not expect the Russians to fight so well nor to have the number and quality of their own modern tanks, planes and guns.

German strategy was not prepared for a winter campaign, and the reich's military machine stalled in the first snows. Heavy drifts blanketed the luftwaffe's airfields, grounding most of the nazi planes and immobilizing the famed panzer divisions which had not been prepared for operations in snow and freezing cold. Thus the Russian winter robbed German strategy of its most potent weapon, the co-ordinated plane-tank arm, whose mobility, speed and firepower had torn big gaps in the Russian lines during the summer and fall of 1941. The Russian forces, however, were adapted for fighting on the icebound steppes and plains. Many of the Red army tanks had been "winterized" for combat on the snows. Added mobility was gained for troops by skis, horses and aero-engined sleds; the latter served as self-propelled mounts for machine gun units and light artillery.

The regulation German uniform, not designed for the rigours of a Russian winter, was particularly inadequate for the winter of 1941–42, the coldest in 150 years. Soviet medical authorities reported that thousands of wounded nazi troops died of gangrene, caused by frostbite. Dr. Goebbels stressed the plight of the reichswehr in a broadcast on Dec. 20, 1941, when he appealed to the German people to donate their furs and warm clothing for the troops on the Russian front. The Russians, on the other hand, were provided with uniforms heavily quilted with sheepskin, and the soldiers were supplied with salves and greases specially prepared to relieve frostbite. This contrast in the personal equipment of the two armies emphasized the amazing lack of preparation by the Germans for a winter campaign. Hitler had been confident that he would be in Moscow before the first snow fell.

The German retreat, however, was not a rout, but a deliberate withdrawal to a winter line, which had been decided upon after the reich command recognized that its troops were too tired for further offensive operations. The invaders, holding the bulk of their territorial gains, established an elaborate series of defenses, behind which a railway network constituted their supply routes to the rear. The key points in this defense system were generally the railway junction cities interconnecting German lines from Leningrad to the Black sea. The principal rail hubs in nazi hands on the northern front were Dno, Velikie Luki and Staraya Russa; on the central front, Kalinin, Mozhaisk, Vyazma, Rzhev and Kaluga; to the south, Orel, Kursk and Kharkov. In order to hold these strong points, the Germans established a concentric system of defenses called "hedgehogs." Under this system a large town, strongly garrisoned and heavily fortified, became the central core of resistance. Outlying villages also strongly fortified encircled the central core. Any attempt to penetrate and reduce these strongly fortified outposts would expose the attackers to intense crossfire. The "hedgehogs," designed to hold out against prolonged sieges, enabled the Germans to transfer many divisions to bases deep in the rear for rest and reorganization in preparation for a summer offensive.

The big Russian offensive started on Nov. 29, 1941. On that date the German armies which had occupied Rostov, gateway to the Caucasus, a week before, were thrown out of the city by Marshal Timoshenko's forces. This successful operation was followed by similar Red army offensives all along the front. A week later, on Dec. 6, soviet columns in the central zone launched a surprise blow at the heavily motorized nazi divisions closing in on Moscow. The Germans had enveloped the Moscow area on three sides, their lines extending in a wide arc from Kalinin on the northwest, around through Mozhaisk to the west, and back to Tula on the south. Russian tank units swept across the snows and hurled back surprised German forces near Tula while other soviet columns hammered back the German wedges in the centre. On Dec. 16 the Germans had to evacuate Kalinin, a vital rail junction, and on Jan. 20, 1942, the Russians recaptured Mozhaisk, one of the nazi "hedgehogs," after a furious 18-day battle. The force of the Russian blows folded back the German wings enveloping Moscow, straightened the central front considerably and removed the immediate threat of an attack on Moscow. At the same time the Russians operating from Kaluga, another recaptured "hedgehog" stronghold, drove north in an attempt to encircle Vyazma, but were stopped by fierce German resistance. A third Russian column, operating from bases 150 mi. northwest of Moscow, surged through the German defenses in the Valdai hills, capturing Kholm and Toropets and threatening the railway junction of Velikie Luki. Meanwhile, the Red army columns from Mozhaisk by-passed Rzhev, drove to the south and hammered a deep wedge into German lines 100 mi. south of the city. The Russian objective was to close a pincer around the Rzhev-Vyazma pocket. Again German resistance stiffened and after weeks of seesaw struggle, a German lever pried open the jaws of the Russian pincer.

On the northern front, the Russian drive to lift the siege of Leningrad was meeting with less success. On Dec. 9, 1941, soviet forces recaptured Tikhvin, which marked the easternmost point of German penetration on this front, and took Volkhov four days later. Thereafter, the Russians struggled vainly to slice off the long German arm circling the city on the south from the Gulf of Finland to Lake Ladoga. (*See* also FINLAND.) The enemy had a solid defense line and were determined to hold it. At a point 120 mi. south of Leningrad, the Russians succeeded in late Feb. 1942 in surrounding a German force estimated at 96,000 men, holding the rail town of Staraya Russa. The Germans, however, rushed supplies and food via air transport to the besieged garrison, and at the end of March a German relief column from the west broke through the Russian lines, opening a supply corridor to Staraya Russa. The Russians, meanwhile, renewing their drive from the Kaluga area, punched a wedge into nazi positions between Smolensk and Vyazma and captured Yukhnov, another "hedgehog," on March 5. They were unable, however, to widen this breach or to disrupt nazi communications in this area.

On the southern front, Timoshenko's forces were racing in pursuit of German armies fleeing Rostov. By Dec. 5, 1941, the Russians had isolated the German garrison holding the seaport of Taganrog. But although Timoshenko's forces had advanced 115 mi. beyond Taganrog by Jan. 15, 1942, they were unable to reduce this nazi citadel.

Activity flared on the Crimean front on Dec. 30, 1941, when a Russian force seized Kerch and Theodosia after a surprise attack on the peninsula via the water gap separating Crimea from the western Caucasus. A Russian attempt to extend the drive westward and relieve the siege of Sevastopol was thwarted by vigorous German counterblows. On Feb. 2, Moscow admitted that soviet troops had been driven out of Theodosia.

As the winter wore on, German resistance wore down the power of the Russian offensive, and by March 15 the Red army advance had ceased. The German hedgehog system had successfully absorbed the shock of the soviet drives, and the important rail centres of Velikie Luki, Staraya Russa, Vyazma, Rzhev, Bryansk, Orel, Kursk and Kharkov were still in German hands. The Russians had failed in their ultimate objectives: the German armies were still besieging Leningrad on three sides; the drive on the central front had failed to pierce through the German main line of resistance. The offensive on the southern front had resulted in a spectacular victory at Rostov, but the major object—the relief of Sevastopol—was not realized.

On the credit side, however, the Russians had turned back the nazi tide from Moscow, Leningrad and the Caucasus, and had inflicted on the wehrmacht its first major defeat in World War II. The Germans were compelled to relinquish their grip on 100,000 of the 500,000 sq.mi. of territory they had conquered in their initial thrust into Russia; and the legend of the German military invincibility, so carefully fostered by Hitler, was destroyed. While Russian losses were held at a minimum during the winter warfare, their casualties for the first 12 months of fighting were huge. On June 22, 1942, the Russians admitted that they had lost 4,500,000 men in dead, wounded and captured. On July 2, 1942, the nazi high command said 337,342 German soldiers had been killed or listed missing in the first year of the Russian campaign, but no mention was made of the number wounded. The Russian figures were regarded as reasonably accurate; the German high command, it was believed, had deliberately minimized its casualty figures to conceal the appalling losses from the German people.

Both sides suffered heavy losses in material. But German industry was still capable of replacing the wehrmacht's losses. And although the Russians lost fully one-third of their industries and mineral resources in western Russia and the Ukraine to the invader, they had moved entire factories, lock, stock and barrel, to the Urals after the German invasion of the western Ukraine. This mass evacuation, combined with the tremendous expansion of the Urals industrial region, helped replace part of their losses.

As the spring thaws set in, turning Russian roads into oceans of mud and bogging down all military operations, the Russians made repeated calls to their allies to open a second front in Europe. British and American convoys were running the gauntlet of submarine packs in the Arctic seas to unload supplies at Murmansk, but this material aid was inadequate in the face of Hitler's impending summer offensive. The Russians insisted that only a second front could stave off disaster.

May to November, 1942.—The German summer offensive of 1942 was launched at the end of June. But the German high command had begun its preparations for this major effort back in the winter of 1941–42, even as reich troops were in retreat on the ice-bound Russian front. The "hedgehog" fortifications enabled the Germans to hold their winter line with a minimum of troops. A large number of divisions, particularly the panzer units—which had been badly mauled in the battle for Moscow—were reorganized and given long periods of rest. Most of Germany's large reserve forces were called up and readied for action and the satellite states of Italy, Hungary, Slovakia and Rumania were "requested" to contribute levies for the big push.

Exact figures of the size and potential strength of the opposing forces were not available. It was estimated, however, that the entire German army numbered about 300 divisions, of which between 180 and 200 were deployed on the eastern front, with the remainder garrisoned at strategic points in western Europe. In addition, the satellite states contributed 20 to 30 divisions for operations in Russia. Germany had some 25 to 30 panzer and motorized divisions, as well as the major portion of the luftwaffe, ready for the big assault. In manpower, Germany was believed to have a slight advantage over Russia. The soviet union had twice the population of the reich, but Hitler, by the use of enforced labour from conquered countries, transferred German farmers and workers to military service. Russia, on the other hand, had lost a large section of its population in the first summer of the war and was hard-pressed to maintain a balance between the manpower needs of its armed forces and those of its war industries.

In terms of quality, the tanks, artillery and aircraft of the Red army were equal to the best equipment of the German war machine. The wehrmacht, however, had substantial superiority in quantity.

In the air, the luftwaffe had overwhelming superiority, although to some extent soviet air power was bolstered by shipment of American and British planes. The Russian Black sea fleet was superior in strength to axis naval concentration in that inland sea.

Economic as well as military considerations were of paramount importance in determining the direction of the German summer offensive. Hitler's principal objective was the Caucasus, whose rich oil fields at Baku, Grozny and Maikop produced more than 80% of Russia's total output of crude oil. Germany's synthetic oil industry and the Rumanian wells produced enough petroleum to meet the reich's barest minimum requirements, but no margin for safety.

In their blueprint for conquest of the Caucasus, German strategists narrowed their field of offensive operations to the southeastern front. Their plan was to drive through the northern Caucasus and slice it off from the Russian mainland. The complete destruction of Russian military power was an essential prerequisite to the success of this plan. Another goal was the severance of allied supply routes to Russia. To accomplish this task, German submarines would intensify their attacks on allied convoys to Murmansk, while the wehrmacht would lash through the Caucasus mountains and seal the Iran frontier, the "back door" route by which allied supplies were shipped into the soviet union. Unable to match the wehrmacht in quantity of mechanized equipment, Russia's strategy had to be purely defensive. Its main points were (1) to prevent the Germans from smashing through the Russian lines and starting a war of movement; (2) alternatively, if this plan failed, to wear down reich manpower and material by process of attrition.

Move No. 1 in the nazi grand strategy for conquest of the Caucasus called for the elimination of the Russian islands of resistance at Kerch and Sevastopol in the Crimea, potential threats to the German southern flank. The offensive for this purpose started on May 8, 1942, with intense aerial attacks and bombardments on the Russian positions on the Kerch peninsula. Four days later, a German spearhead broke through the fortified Russian positions. Kerch itself fell to the invaders on May 23. The fall of Kerch cleared the way for a drive on Sevastopol, and on June 7 the Germans launched a massive assault against this soviet citadel, which had been under land siege since Nov. 1941. But Sevastopol proved a hard nut to crack. Its land approaches were ringed by a belt of fortifications 12 mi. in depth, and were studded with a mass of bunkers, gun emplacements and minefields. An intense land and air bombardment opened the way for German tank-led infantry columns which penetrated the outer belt. But the Russians fought back with incredible ferocity, exacting a heavy toll in casualties for every foot gained. On July 1, German and Rumanian forces, breaching the inner fortifications, stormed into the city itself and mopped up the remnants of the Russian garrison.

NAZI SOLDIERS entering Stalingrad during the epic siege of 1942

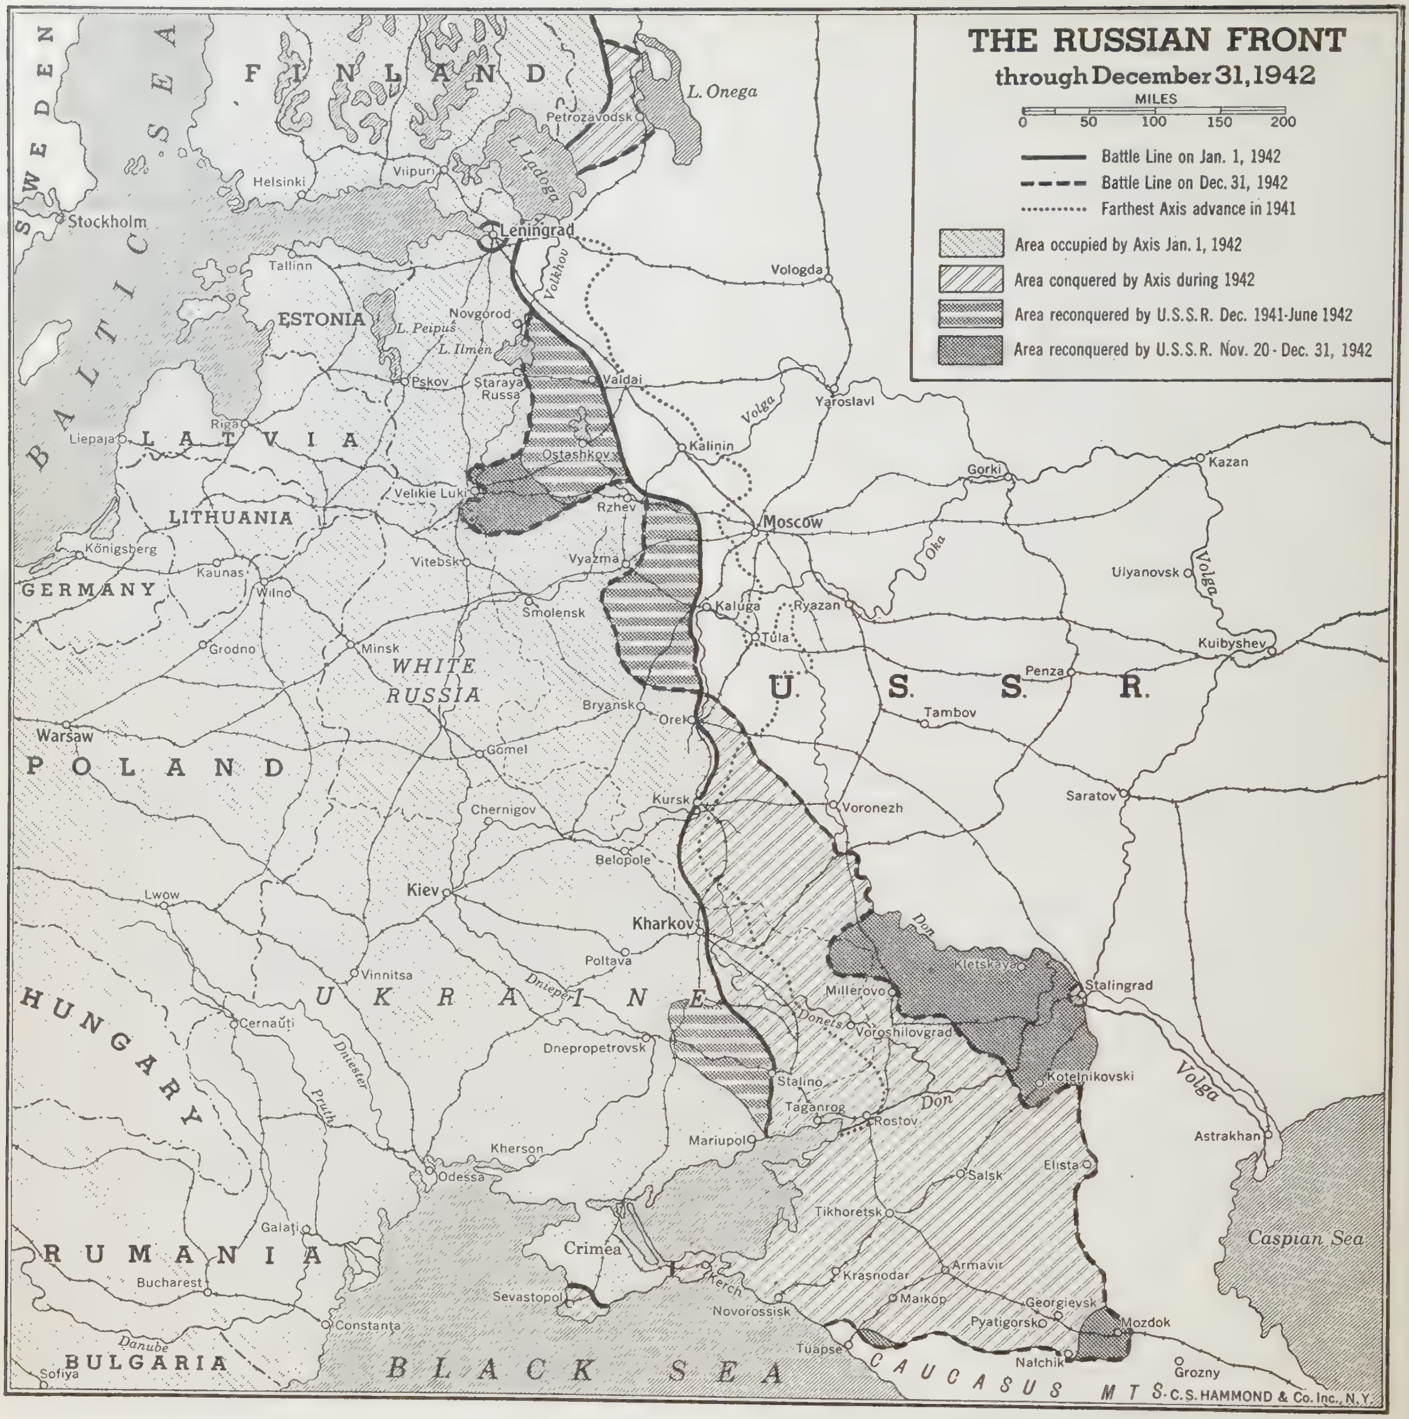
The Russians did not let the assaults on Kerch and Sevastopol go entirely unchallenged. On May 13 soviet armies in the Donets basin opened a drive on Kharkov in a manoeuvre to divert German strength from the Kerch attack, and penetrated the outer defenses of the German lines. On May 19 the Germans struck back at the southern end of the Russian flank, compelling Red army detachments to withdraw rapidly to avoid encirclement. By May 30 both operations, preludes to the greater struggle to come, had reached a standstill. The resistance of the Russian garrison in Sevastopol was not futile. By prolonging the battle for 25 days, the Russians upset Hitler's timetable for the big drive to the south.

A week before the axis took Sevastopol, Hitler opened his drive to the Caucasus. On June 25 German columns overran Russian positions on the Donets river southeast of Kharkov, captured Kupyansk and set the great offensive rolling. Three days later, the Germans unleashed a companion drive north of Kharkov. Striking from bases at Kursk, a large armoured force crushed Russian defenses and sped westward. One tank column struck straight toward Voronezh while another swerved to the south toward Rossosh. By July 5, these armoured spearheads had advanced 100 mi. Pounded by air and land, the Russians defending the Voronezh sector withdrew to the east, unable to stem the powerful nazi tank thrusts. The German armoured divisions then crossed the Don river; established bridgeheads on the eastern bank, raced toward Voronezh 10 mi. farther east, and invested part of the city. The Russians, meanwhile, regrouped their forces and staged a fierce counterattack at the German right flank. Surprised by this unexpected blow, the Germans halted to protect their flanks. The Russian momentum hurled the Germans back across the river and prevented the invaders from cutting the railroad linking Moscow and Rostov.

Failing to unhinge the Russian defense anchor at Voronezh, the Germans attacked in great force at Russian weak spots in the south, between Kharkov and the Don. Three spearheads flung toward Rostov and the great bend of the lower Don made rapid progress. The northern arm captured Rossosh. By July 12 the central spearheads had reached the Don at Boguchar, while the southern spearhead surged through Millerovo and occupied Voroshilovgrad shortly afterwards. In the first 20 days of their drive, the Germans advanced more than 225 mi., occupying a large slice of territory in southeastern Russia. The Russian armies, powerless to halt the sweep of the armoured columns, fought delaying actions.

On July 20, 1942, German columns were fighting their way east to the Volga and south into the Caucasus. One spearhead sped along the northern rim of the great Don curve and surrounded Kletskaya. Another filtered through Russian defenses on the southern rim; and on July 25 the Russians admitted that this force had succeeded in establishing two bridgeheads across the Don river at Tsimlyansk. Below the Don bend, German tank columns deliberately avoiding a frontal assault on Rostov, flanked the city from the east and compelled the Russian garrison to withdraw, in order to escape annihilation. On July 27 the Germans marched into Rostov (the third time the Caucasus gateway had changed hands in World War II to that date), and also occupied nearby Novocherkassk. The German column which took Rostov then split into three spearheads which fanned southward into the Caucasus, seizing railway junctions, ports and naval bases. Hundreds of dive bombers blasted the Russian positions and provided an effective cover for the advancing tank-led columns. Parachute troops landed behind the Russian lines in an attempt to disrupt communications, and troop transports disgorged machine-gun units and small tanks behind the Russian rear lines. The Russians, however, calmly ignored these terror tactics and fought a stubborn delaying action. They skilfully avoided encirclements, withdrew their entire tank forces after the fall of Rostov, and retired in good order.

By Aug. 9 the armoured legions of the reich, driving into the Caucasus, had captured Maikop, but it was an empty prize as the Russians filled the



oil wells with concrete before evacuating the city. Two weeks later another German column veering toward the southwest Caucasus captured Mineralne Vodi in a thrust that threatened the Grozny oil fields. The German juggernaut gained momentum, and at the end of August advance tank units had reached the slopes of the great Caucasus wall. Georgievsk, on the road to Mozdok, had fallen; Mozdok itself was threatened. German columns passed through Pyatigorsk on the road to Ordzhonikidze. By Sept. 1, 1942, the Germans were in control of a great triangular-shaped segment of the Caucasus. The base of the triangle extended from Novorossiysk on the west to points beyond Salsk on the northeast. The apex was the town of Georgievsk.

As Baku, the centre of Russia's richest oil regions, appeared to be within the grasp of the nazi mechanized columns, Russian resistance suddenly hardened. Fierce Russian counterattacks slowed the German push toward Nalchik. The striking power of the panzer units was reduced by inadequate supplies resulting from over-extended communications. The Russians, fighting a defensive war in a mountainous terrain suitable to attrition tactics, continually slashed the narrow nazi-held supply corridor. As winter came to the Caucasus peaks and passes, it was becoming apparent that the nazi strategy—to march straight through to Baku before winter—had been unsuccessful. By Oct. 1 the Germans in the Caucasus faced the bleak prospect of another Russian winter.

Meanwhile, German armies to the north drove a new series of wedges into the Russian defenses in the big Don bend. The Russians, however, refused to give battle in this area, which was a natural pocket and therefore adaptable to panzer tactics, and withdrew beyond the bend toward Stalingrad. The two German columns, circling both the northern and southern rims of the Don bend, converged. Below the bend, a third column, driving southeastward in an effort to cut the Volga at Astrakhan and also sever the round-about rail communications linking Stalingrad to this Black sea port, was stopped at Elista, 200 mi. short of its goal. But by Aug. 17 the Germans were in complete possession of the Don bend. Two weeks later, strong armoured columns crossed the Don river at the apex of the bend, and panzer divisions gradually moved in on Stalingrad.

As the battleground shifted toward Stalingrad, the Russians attempted a diversion on the central front far to the north with an attack on Rzhev that started Aug. 11. Although the Russians were able to advance about 30 mi. and to inflict heavy casualties on the Germans, they were stopped short of their goal and failed in their main objective—to compel the Germans to divert troops from Stalingrad.

Home of Russia's great tractor and tank plants, Stalingrad and its industrial suburbs spread out for nearly 20 mi. along the western banks of the Volga river. Its capture would enable the Germans to sever the last rail link with the Caucasus, and to separate the Russian armies in the Caucasus from those in the north. The Germans would thus gain control of the Volga, a vital transportation artery; and Russia's armies would be compelled to fall back beyond the river's east bank.

The battle for Stalingrad began with the German crossing of the Don.

On Aug. 22–24 the Germans established a solid foothold on the river's east bank and their main striking force warily approached the 30-mi. deep defense belt outside Stalingrad. For the final onslaught against Stalingrad the Germans massed an estimated 40 divisions, strongly bolstered by tank units and an air fleet of 1,000 planes. Against this force, the Russians decided to make a final stand behind Stalingrad's protective chain of fortifications and depended on their great quantity of heavy artillery to repel the invaders.

The Germans opened a massive plane-tank assault on Stalingrad's outer defenses in late August. Dive-bombers poured tons of explosives on the defense belt. Tanks then bludgeoned their way through softened spots in the city's defenses and were followed up by droves of infantry units. But Russian soldiers and marines, joined by armed peasants and civilians, fought with unprecedented stubbornness, hurling back wave after wave of German troops trying to penetrate the city and reach the Volga. Sheer weight of numbers finally enabled the Germans to conquer several districts on both the north and south sides of the city. The luftwaffe was then called in to crush all resistance in Stalingrad with a deluge of bombs. Bombs virtually rained on the city. Russian officers were quoted as saying that at one time, at least 1,000 German planes shuttled back and forth over Stalingrad, dumping their bomb cargoes with monotonous regularity and then going back for more. Few buildings were left standing, but the luftwaffe tactics boomeranged. The defenders converted every ruined house, every pile of debris, every crater into an improvised fortress. The streets were piled so high with rubble or pocked so deeply by bomb-craters that tank operations became impossible. Resourceful Red army troops concealed behind crumbled ruins at strategic points would decimate attacking Germans with deadly cross-fire. The Russians fought for every street, every house, every stairway. Still the Germans staggered forward, but their gains were measured in yards. On one day, the Germans would capture a row of houses; the next day, the Russians would recapture it. Toward mid-September, the Germans intensified their pressure and battled their way into the central part of the city. Reinforcements were rushed to the defenders via the Volga, and the Germans were hurled back. By Oct. 1, the German forces were tiring; the finest of the wehrmacht's shock troops had been slaughtered, but the resistance of the Russians appeared stronger than ever. On Oct. 8 a cryptic communiqué of the German high command admitted the futility of taking the city by storm and said that heavy artillery, instead of troops, would be used to batter Stalingrad into submission. By the end of October, picked Red guard units gradually circled the city, moving from the defensive to the offensive, as the Russians were preparing a massive drive to encircle the reich armies in Stalingrad.

Anticipating the Russian counterblow, the Germans sought to divert soviet strength from the besieged city with an attempted drive toward Ordzhonikidze in the Caucasus. Nazi tank columns drove beyond Nalchik, but a Russian force, showing unexpected strength, routed the tank column and slew 5,000 Germans. This futile operation was a pitiful anticlimax to Hitler's grandiose bid to conquer the Caucasus and was the final phase of the great German summer offensive of 1942.

Casualties on both sides during the five-month campaign were enormous. On July 16 a Moscow communiqué asserted that German casualties for the two-month period from May 15 to July 15 totalled 900,000; Russian casualties were put at 399,000. A German high command version of casualties, issued Aug. 12, said 1,044,741 prisoners had been captured since the spring of 1942. One estimate of losses in the battle of Stalingrad said that total Russian casualties at the height of the battle were 6,000 daily; the German dead alone were placed at 2,000 daily. In the struggle for territory, the Germans had won control of a vast area roughly the size of Texas, which, added to the previous German gains, gave Hitler control of 700,000 sq.mi. of Russia. But the wehrmacht paid a very heavy price for these gains. In addition to depletion of their manpower, the German armies had expended a vast amount of war material. A Russian general in charge of a Stalingrad sector said that the wehrmacht had had 26 panzer divisions in full action at the beginning of the offensive, but that 14 had been destroyed or crippled in the ensuing battles. In order to maintain the momentum of their big push, the Germans were compelled to weaken their North African force with disastrous results. Most important of all, the German mechanized armies had failed to destroy the Red army. Even in retreat, the soviet troops battled superbly, withdrawing in order, and the Russian general staff proved quite willing to relinquish territory if the cost of holding it would involve excessive casualties.

November 1942 to January 1943.—The remarkable recuperative powers of the Red army were demonstrated by the vigorous offensive of Nov. 1942. This operation came as a distinct surprise to most military observers; the prevalent view was that the Russian striking power had been critically if not hopelessly impaired in resisting the great summer offensive of the nazis. The Russian strategy, however, had been to keep casualties down to a minimum, and in the campaigns of the Caucasus and the Don bend the Russians withdrew rather than risk heavy casualties in futile resistance. Only at Stalingrad did the Russians hold their ground, since the Volga waterway was indispensable to continued soviet participation in the war. It can now be seen that the Russians were intent on saving their manpower in preparation for a second winter counteroffensive. After the Stalingrad battle, there was reason to believe that the Germans withdrew many battered divisions from Russia for rest and reorganization, which would indicate that Hitler again proposed to hold a stabilized line for the winter.

The goal of Russian strategy was (1) to reconquer the territory lost in the summer of 1942, and (2) to break the main German line by destroying its anchor positions. Were they to be deprived of their "hedgehog" fortifications, the Germans would have great difficulty in launching a third offensive in 1943. Their anchor positions on the northern front were Schlusselburg (commanding the approaches to Leningrad), Dno and Velikie Luki. German defense strongholds on the central front were Rzhev, Vyazma, Orel and Kursk. On the southern front they were Kharkov and Rostov. The Germans also held the key Caucasian cities of Salsk, Tikhoretsk, Armavir, Kushchevskaya and Krasnodar.

After the American landings in North Africa in Nov. 1942 the rumour went through Europe that Hitler had withdrawn 40 divisions from Russia to defend the Mediterranean zone. High Russian officers, however, were quoted as saying that the Germans had sent additional infantry and tank divisions into Russia after the North African campaign had started. The diversion of some luftwaffe squadrons to the Mediterranean arena, it was said, was a normal procedure, as the first winter campaign demonstrated that the German air force was not adapted to winter warfare. The Russians did not tend to belittle the strategic importance of the North African campaign, since it gave promise that the allies really contemplated an invasion of Europe which would relieve German pressure on Russia.

On Nov. 22 the Russians launched a sweeping offensive to flank the German armies in the Stalingrad pocket by a broad enveloping movement. One Russian prong moved rapidly around the north rim of the Don bend; another around the southern rim. The columns then converged, cutting the Stalingrad railroad to Rostov. The columns then continued westward and surrounded German troop concentrations in a series of pockets by similar pincer operations. At the same time a third column fought its way down the railroad to Novorossiysk. At the end of the first week, 26,000 Germans had been killed and 24,000 others were captured. On the southern edge of the Don elbow, the advancing Red armies took Kalach, on the northern arm; Serafimovich also fell. German observers said the Russians were employing an "endless stream" of tank columns in the big push. And Russian forces in Stalingrad now turned the tables on the Germans; the besiegers became the besieged.

As the southern offensive gained momentum, the Red army launched another drive on Nov. 28–29, far to the north to reduce the troublesome German pocket at Rzhev-Vyazma on the central front. Three spearheads cut the Rzhev-Smolensk railroad, another encircled the German fortress of Velikie Luki. By Dec. 1 it was obvious that the Russian drives, first regarded as only local operations, had developed into major attacks.

The Red army then opened a third large offensive in the Voronezh sector on Dec. 15. One column moved to the southwest, 150 mi. due east of Kharkov. By mid-January 1943 this force was hammering the flank of the German garrisons protecting Kharkov, and had blocked a possible enemy pincer drive to cut off the Russian spearhead moving toward Kursk. As a result of the loss of Rossosh, German positions in the Voronezh sector became untenable, and on Jan. 26, 1943, a German communiqué admitted the evacuation of Voronezh "in order to shorten the front." Driving along the railroad connecting Voronezh and Kursk, the Russians flanked Kursk on the north and then attacked the city in force. The defenses of Kursk collapsed, and its capture was announced on Feb. 9, 1943. This was a victory which approached in importance the Russian triumph at Stalingrad. The Germans had held Kursk since Nov. 11, 1941, and had converted it into one of the strongest points on the formidable Orel-Kursk-Kharkov hedgehog line which defended the western flank of the Don basin. It was also a vital rail junction, and its capture made feasible gigantic flanking movements against Kharkov in the south and Orel on the north. Kharkov fell on Feb. 16, 1943.

The Red army launched a fourth offensive on Jan. 4, 1943, to reconquer the Caucasus. Russian detachments, moving up the road from Ordzhonikidze, overwhelmed German forces holding Nalchik, and recaptured the city. Thus by the beginning of 1943, four soviet offensives were moving at full speed toward the German winter line.

The main blow of the Red army fell in the Stalingrad sector and the related Don bend, 20 mi. to the west. The immediate objective was to surround and destroy the German armies in this vast area; the ultimate goal was the capture of Rostov, which would cut off the last avenue of escape by land for the German armies in the Caucasus. Strong tank and motorized artillery columns pressed giant pincer movements against both flanks of the German armies in the Stalingrad-Don bend region. On Dec. 29, 1942, Moscow communiqués reported that the soviet column pressing forward from Kalach took Kotelnikovski, 100 mi. southwest of Stalingrad. Ten days later the Russians had turned the flank of Hitler's army of 330,000 troops in the Stalingrad area; the remaining German forces squeezed their way out of the closing Russian pincers and retreated through the Don valley. On Jan. 17, 1943, Moscow announced that Millerovo, a rail junction less than 100 mi. northeast of Rostov, had been retaken as the northern claw of the Russian pincer curled closer to the gateway of the Caucasus. The Russians had now drawn a tight ring around German armies in the Stalingrad pocket, and had closed another loop around the remnants of reich columns in the area to the west. This manoeuvre deprived the luftwaffe of air bases from which to fly supplies and food to the trapped Stalingrad armies. German troops in the ruined city, running short of food and bullets, burrowed into cellars and lived on short rations. But they fought on grimly and refused to surrender.

Meanwhile, the Russian offensive west of Rzhev had resulted in the capture of Velikie Luki, another hedgehog fortress. The Russians, announcing the capture of the town on Jan. 2, 1943, said that the entire German garrison of 75,000 had fought to the last man. The Germans, however, denied the Russians had taken Velikie Luki. On Jan. 11, Russian forces opened a drive to relieve the siege of Leningrad. A week later, the Russians had captured Schlusselburg and Sinyavino and had carved out a land corridor nine miles wide which gave the city an overland supply route to Moscow.

The Caucasus front, too, was becoming a graveyard of German hopes. On Jan. 2, 1943, a Russian column cut off the German wedge at Elista. Farther south, Russian columns were driving the exhausted German armies back along the roads which had been the scenes of nazi triumphs in the summer of 1942. On Jan. 11, 1943, the Russians announced the capture of Georgievsk, Mineralne Vodi and Pyatigorsk. Russian armoured divisions then fanned out, capturing Armavir on Jan. 23, and Tikhoretsk on Jan. 31. Maikop, the great oil centre, was also retaken on Jan. 31. By Feb. 8 the Russians had reoccupied most of the key cities on the Caucasian shores of the Sea of Azov, and two armies were converging on Rostov.

In Stalingrad itself, the Russians were proceeding systematically with the extermination of what was left of the German armies. On Jan. 31, Moscow announced that a nazi pocket just west of that city had been wiped out and that a German field marshal and his staff and 18,000 troops had been captured. On Feb. 2, a soviet communiqué said that the last remnant of the Stalingrad force had surrendered. Thus one of the greatest and bloodiest battles in history ended in a Russian victory. In Germany, four days of mourning were decreed for the loss of 330,000 men who were captured or killed in Stalingrad.

IV.—AIR WAR OVER EUROPE

In early 1942, Britain's war plants had recovered from the effects of the German air blitz, and the R.A.F., strengthened by increased production and by aircraft sent from the United States, was gathering strength to launch a sustained aerial offensive on the reich. The R.A.F. intended to subject German industry to the same kind of air war that the luftwaffe had waged over Britain, and to hit the reich so severely that the luftwaffe would be compelled to withdraw planes from Russia to protect the home front. Britain's leaders had made it clear that while the United Nations were not yet ready to open a second front in Europe, the projected aerial offensive would be offered as a substitute until allied armies would be sufficiently strong to invade the continent.

The R.A.F. tested its offensive power by day and night raids over the reich and German-held territory during January and February, although bad flying weather reduced these operations to "experimental" preliminaries. On March 3 the R.A.F. staged its first big raid of importance with a two-hour attack on the Paris suburb of Billancourt that left most of the huge Renault works in ruins. Reconnaissance photographs taken immediately after the raid revealed that the British bombs had virtually destroyed the industrial potential of this plant, an important source of tanks and trucks for the wehrmacht. Four days later, R.A.F. squadrons dealt a similarly damaging blow to the Matford works in Poissy.

As the murky weather over western Europe cleared, the British intensified their aerial offensive. Bombers roared over the Rhineland and Ruhr with great frequency, and ports, U-boat bases, nazi shipyards and shipbuilding centres were special targets. The length of the air raids was extended. On April 14 British bombers hammered reich industrial and rail centres without a stop for nine hours. More bombers participated in night raids, and there was an increasing proportion of heavy bombers with relation to fighters. Toward the end of April as many as 600 planes were participating in a single daylight operation. British aerial tactics during this period tended toward concentrated mass attacks on a single target rather than on the dispersal of bomber strength over a multitude of scattered objectives.

The R.A.F. raids on Luebeck and Rostock provided striking demonstrations of the effects of concentrated mass bombings. On March 26 R.A.F. planes dropped 340 tons of explosive and incendiary bombs on the Baltic port of Luebeck in a three-hour raid, destroying half of the old town with its port facilities and setting fire to industrial plants. On April 24 British bombers devastated the port of Rostock, whose dock facilities and war plants became a raging inferno. Guided by the great fires of the first raid, the R.A.F. bombers returned on three successive nights. The cumulative destructive power of 800 tons of bombs dropped in these four days of constant aerial attacks reduced the city to ashes. In both the Luebeck and Rostock raids, it was believed that large quantities of war materials and supplies destined for the Russian front had been destroyed.

The Germans retaliated against the raids on Luebeck and Rostock with attacks on the unprotected cathedral cities of England, such as Exeter, York, Bath and Canterbury. These attacks, called the "Baedeker raids" indicated that the luftwaffe did not want to spare bombers for raids on England while preparations were under way for the great offensive in the east.

The British then experimented with long-distance bombing expeditions, and their long-range bombers ventured deep into the heart of Hitler's Europe. R.A.F. bomber squadrons, operating from bases in southeastern England, raided the Skoda armament works in Pilsen (Czechoslovakia), and also made attacks on war plants in Turin, Genoa and Milan. Germany, however, still remained the principal objective of the British aerial offensive, and raids on Rhine and Ruhr cities increased in frequency and strength. Starting May 4, R.A.F. planes bombed Stuttgart for three nights in succession. Mannheim was the target for another mass raid on May 19, when a big bomber force dropped more than 40,000 incendiary bombs over the Rhine city's chemical and munitions plants.

The number of R.A.F. bomber and fighter planes employed in mass raids rose steadily, reaching a peak with the great raid on Cologne on May 30. On that night 1,130 planes of all types attacked Cologne. Bombers came in every few seconds from different levels and in the short space of 90 minutes laid down 3,000 tons of bombs on the city. A great section of Cologne's metropolitan district was razed, and whole industrial areas were devastated. Forty-eight hours later, an armada of 1,036 planes struck at Essen, home of the famous Krupp armaments works, setting huge fires in the industrial regions circling the city. British losses in both raids were relatively low; 35 planes failed to return from the attack on Cologne and 44 from the raid on Essen. Against both targets, the R.A.F. used the big two-ton "block-buster" bombs. The British found by experience that precision bombing at night, particularly over targets heavily defended by anti-aircraft, was both ineffective and costly. For this they substituted mass bombings over a target, depending for results more on the weight of bombs dropped than on accuracy. The block bomb was an efficient projectile for use in concentrated raids because of its tremendous concussive power. Meanwhile, the air offensive grew in weight and frequency as the German armies prepared to launch their offensive in Russia. The 1,000-bomber raid was a successful experiment—a preliminary operation to determine the course of the aerial blitz in the future—but disappeared from British air strategy after the Cologne and Essen attacks. The reasons were simple—Britain then lacked the facilities and replacements to stage daily 1,000-plane raids over the reich. It was necessary to maintain a balance between the size of the raids and the limits of available facilities and replacements. After the Cologne and Essen raids, however, British air armadas of between 200 and 600 planes became a commonplace instead of a rarity. Improvements in the speed, distance and bomb-load capacity of heavy bombers compensated to some degree for the four-figure raids. Two-ton bombs were being replaced by four-ton "block-busters," whose concussion crushed steel and concrete structures which would have been able to withstand less devastating explosions. Many of the raids on German cities in the late summer and fall of 1942 were nearly as effective in destructive power as the Cologne and Essen raids, although less spectacular.

Some of the chief targets for R.A.F. raids during this period were the submarine yards and Diesel engine plants which were the backbone of Germany's continued U-boat warfare against allied convoys. It was expected that such an effort would slow down production of submarines. Attacks continued against Germany's transportation system and war factories with the further object of interrupting the flow of supplies to the Russian front.

The participation of the American air force in the aerial offensive against Germany and the occupied countries extended the scope and variety of allied raids. Prior to the arrival of American crews and planes, the British had tried daylight precision raids, but only on an experimental basis. Operational details of both the British and American ships had not been disclosed at the end of 1942, but it was generally agreed that the R.A.F. bombers were designed for night mass bombings and were too heavy and too slow for daylight raids on specific targets. The newer models of the U.S. Flying Fortresses and Liberators, however, were well suited for this type of flight. These large craft, heavily armed and armoured, had both speed and high "ceilings." The Flying Fortresses were put through their first test on Aug. 17 when, escorted by a heavy guard of R.A.F. fighters, a squadron of the fast American bombers raided Rouen. The United States bombers showed remarkable accuracy in hitting their targets and had adequate firepower to fend off challenging German fighter planes. On Oct. 9 the American bombers staged their first big raid against enemy objectives. Some 115 Fortresses and Liberators, accompanied by 500 fighter craft, launched an all-out aerial blitz on the locomotive and steel works at Lille in northern France. Refusing to fight with the speedy allied escorts, swarms of German fighter planes charged straight at the bombers. The American bombers, however, bristling fore and aft with rapid-fire guns and cannon, shot down at least 48 of the attacking craft, probably destroyed 38 others and damaged 19 more. The Americans claimed that only four of the Fortresses were lost in this battle.

In the late fall of 1942 the R.A.F. suddenly extended its aerial onslaught to Italy. On Oct. 22, a day before the British Eighth army launched its big push to drive the Germans out of Egypt, 200 R.A.F. bombers attacked Genoa. Several days later similar attacks were launched against the industrial cities of Milan, Savona and Turin. The purpose of the R.A.F. attacks was to blast supply bases and communication lines serving the axis armies in Egypt. On three successive nights they made the 1,400-mi. round trip to the industrial and port cities of northern Italy, pounding Turin, big arms centre, Milan and Savona. Genoa alone was blasted six times by British bombers shuttling back and forth over the Alps. The British block bombs levelled 27 ac. of the dock area and large parts of the industrial and business districts. The R.A.F. then turned its attention on Turin, striking at the city in three heavy raids on Nov. 20, Nov. 28 and Dec. 28. Meanwhile, United States Liberator bombers from bases in the middle east theatre of operations struck at Naples on Dec. 4, damaging piers, breakwaters and warships in a high-altitude raid on the Italian port.

It has been said that the great British air offensive of 1942 was at least as destructive to axis morale as to axis war production. The German people were profoundly shocked by the R.A.F. raids which took heavy toll of civilian casualties. They had been led to believe the assurances, made so confidently by nazi propagandists and leaders during 1940 and 1941—when the Germans were riding the crest of victory—that the reich would be immune to aerial attack. The Italians, too, were terrified by the unexpected rain of death from the skies, and their morale slumped dangerously. But the aerial blitz failed to disrupt German war production and communications to a sufficient degree, or to divert enough luftwaffe planes from the Russian front, to stop the German offensive. One estimate said that the British blitz probably slowed up German production by 15% to 20%.

V.—COMMANDO OPERATIONS

British Commando operations in 1942 shifted from the coast of Norway to the Atlantic shores of Occupied France. The initial raids in 1942 were limited to hit-and-run operations; their objectives were to destroy material of value to the enemy, to collect information and to shake German morale. On Feb. 27, a small Commando unit slipped through German defenses on the French coast and destroyed a nazi radio detector station at Bruneval, thus facilitating a subsequent R.A.F. attack on industrial plants in the Paris area. Commando forces staged a more ambitious expedition on March 28, when a naval detachment drove an old destroyer into St. Nazaire harbour and rammed it into the lock gates. Commandos accompanying the expedition surged ashore, blew up the inner lock gates and demolished dock and shipyard installations. Meanwhile, the five tons of delayed action explosives packed in the destroyer's bow blew up, wrecking the main lock gates and sinking the warship to block the entrance. A number of French residents, who mistook the raid for an actual invasion and helped the Commandos, paid with their lives. The Germans executed 20 hostages of St. Nazaire in reprisal.

The Dieppe Raid.—The Commandos staged two minor forays on the French coast in the Boulogne area, in an effort to probe the strength of German coastal defenses for the subsequent large-scale raid on Dieppe. This raid was launched in force against the strongly fortified port on the northern coast on Aug. 19. At dawn, an allied convoy escorted by destroyers, approached the shores. A striking force of 5,000 Canadian troops, accompanied by British Commandos and smaller detachments of American Rangers and Fighting French, streamed toward the beaches in self-propelled landing barges. Small tanks also were landed, and the entire operation was covered by an air force of 1,000 planes. But the German garrison in Dieppe, warned by the crew of a nazi tanker which had sighted the allied convoy, was not taken by surprise. As the allied forces were landing, they were raked by German batteries, which had been placed on hills overlooking the beaches. Long-range guns farther inland decimated the troops struggling to get ashore while a few Stuka dive-bombers which succeeded in penetrating the strong allied plane escort sank a number of the landing barges. A few of the outlying German batteries on the flanks were destroyed by the attackers, who occupied the fortified casino and part of the lower town. The fighting raged for nine hours; then the attacking forces withdrew to the beaches, embarked and returned to England.

Nearly half of the entire attacking force was lost in the Dieppe raid. Canadian casualties alone totalled 3,350 or 67% of the entire forces. The aerial battle that raged over Dieppe engaged the largest number of planes since the battle of Britain. The British admitted losing 98 of their own craft, but claimed the certain destruction of 92 German planes and estimated that twice that number had been damaged.

Only 7,000 allied troops in all were employed in the Dieppe attack, which was regarded as a full-dress rehearsal for the long-heralded second front in Europe. Evidence that the Dieppe battle was merely a raid was seen in the following broadcast to the French people a few minutes before the fighting started:

"This is the B.B.C. speaking to you from London. American Rangers and British Commandos are fighting on your soil. *BUT DO NOT HELP THEM.* This is *NOT* an invasion. It is only a raid. France and her allies will need you on the day of liberation, so do not betray yourselves to the Germans. *DO NOTHING NOW.* This is *NOT* an invasion."

VI.—NORTH AFRICAN CAMPAIGNS

In Jan. 1942 the British imperial armies were moving across the desert sands of Cyrenaica in a drive which had started on Nov. 18, 1941, from El Sollum, a British base near the Libyan border. British tank columns pursuing Marshal Rommel's German-Italian armies, lifted the siege of Tobruk, recaptured Bengasi and by Jan. 2, had entered the port of Derna. At the beginning of this offensive, Marshal Rommel retreated toward Libya rather than risk a showdown battle with the superior British forces. But by the middle of January the British drive was bogging down at Cyrenaica's western borders. Some quarters attributed this abrupt halt of the British in the African desert to over-extended supply lines. Others thought that withdrawal of veteran Australian units, which had been sent to the far east, had forced the British to stop the projected drive into Libya. Rommel utilized this breathing spell to reinforce his armies with new tanks and more planes, and launched a counteroffensive against British lines at Mersa-el-Bregha on Jan. 22. The British, exhausted by their 400-mi. march across the desert, were driven back across the Cyrenaican coastal hump. On Jan. 29, Rommel's panzers reoccupied Bengasi, but 10 days later fresh British reinforcements checked his advance at Tmimi, 70 mi. west of Tobruk. The main British force then dug in on a line extending from El Gazala on the coast road to Bir Hacheim, a desert outpost. Here a stalemate developed.

During this lull, the axis resumed attempts to knock Malta out of the war. From this small island base, only 60 mi. from Sicily, British aircraft and submarines constantly harried axis supply ships and air transports bound for Africa. In March the axis mobilized 600 planes in Italian airfields and launched an intensive aerial assault on Malta, bombing the island day after day until Malta became known as the most heavily bombed place in the world. This British island base, in the first 28 months of the war, was bombed about 3,000 times. But the bombings could not knock Malta out of the war, or destroy it as an air base. Although the British still clung grimly to the island, the axis air and sea blockade seriously reduced its efficiency. One of the royal navy's difficult problems was that of getting through to Malta. While this problem remained unsolved, Rommel hurled his Afrika Korps against the British lines on May 26. His drive was not originally intended as a thrust toward Alexandria and Suez. It was started in the "hot" season, when fighting exhausts even veteran desert soldiers.

The axis drive in Africa was probably a diversion designed to draw supplies destined for Russia to the African front at a time when the Germans were preparing to launch their big offensive in the Caucasus.

In the first 15 days of fighting, the British held their ground behind their fortified line, extending from El Gazala on the sea, inland to Bir Hacheim. On June 11, however, the Free French garrison holding Bir Hacheim, the southern anchor of the British line, was forced to withdraw after an 11-day siege. This freed a major portion of Rommel's strength, and he now threw the whole weight of his forces at the British line covering the approaches to Tobruk. In an attempt to counter Rommel's growing offensive power, Gen. Ritchie, commander of the British Eighth army, struck out with a force of 300 tanks at the enemy's flank at the southwest. Plunging ahead recklessly, the British, on June 13, blundered into an ambush prepared by the Germans. When night fell the British had lost all but 70 of their tanks.

Rommel never gave the British an opportunity to redress this error. His Afrika Korps smashed quickly ahead, rolled up the British line northward from Bir Hacheim to El Gazala. By June 20 the British forces, robbed of most of their tank power, were in full retreat. The British again decided to make a stand at Tobruk. But Rommel launched an all-out tank and plane assault against the desert citadel before the British had time to consolidate their positions, and on June 21 captured Tobruk, its defending garrison of 25,000 British imperial troops, and great stores of equipment. The British Eighth army, which had lost half of its original strength and a large part of its equipment, retreated in haste toward Egypt. Rommel, expert in the war of manoeuvre, did not give the British a breathing spell. His panzer divisions chased the British across the Egyptian frontier. Gen. Sir Claude J. E. Auchinleck, who had superseded Ritchie at the head of the British forces, whipped his reinforcements into line for a determined stand and on July 1 stopped Rommel at El Alamein, only 70 mi. from Alexandria. There were local skirmishes in the desert before El Alamein, but the Afrika Korps was battle-weary and unable to press further. By the end of July, the balance of the forces had become too even for either antagonist to launch an offensive with real hope of success.

The British had averted disaster by a narrow margin. On July 2 Churchill disclosed that the British had lost 50,000 men and vast stores of supplies.

Many factors contributed to Rommel's success, the chief among which was his undoubted superior skill in tank tactics. Another was the superiority of his weapons. While the respective merits of the British, American and German tanks were still the subject of dispute, many allied observers asserted that the German tanks had more armour and firepower. The famed German 88-mm. anti-tank gun, a mobile weapon that could be used with equal effectiveness against both tanks and planes, was reported to be the best gun of its kind. Rommel's tank salvage system functioned efficiently; German salvage crews operating in the front lines would tow a battered tank back to machine shops in the rear for quick repairs and return it to action in a few hours. Co-ordination between the R.A.F. and ground forces in the summer desert battle was reported to be lacking; on the other hand, Rommel's tanks and Stukas synchronized their operations with faultless precision.

During the stalemate that followed Rommel's big drive, the British strengthened their defenses at El Alamein, where they held a 40-mi. corridor between the Mediterranean and the Qattara depression, an impassable salt marsh. Rommel retired behind his defenses, organized for miles deep and studded with minefields, barbed wire, concealed artillery, and anti-tank traps. Meanwhile, countless allied convoys were pouring supplies into Egypt. American planes joined the R.A.F. in the African desert and relentlessly pounded axis merchantmen and supply bases in Africa, Italy and Greece. Furthermore, Rommel was receiving fewer supplies, apparently because of Hitler's intention to concentrate on the Russian campaign. The majority of German supplies went to the eastern front; Rommel had to be content with leftovers. The British, on the other hand, had massed a huge air fleet, a powerful tank army and a large number of divisions.

The British launched their offensive on Oct. 23, dropping a heavy air and artillery barrage on Rommel's lines to wipe out gun emplacements. For the first 10 days of battle, the fighting swayed back and forth as the British Eighth army, under command of Gen. B. L. Montgomery, carefully filtered through axis minefields. After clearing out these obstructions, the Eighth army struck with such force that the main axis lines collapsed. Again, the Egyptian desert became the scene of a lightning war of manoeuvre. This time, however, the positions were reversed. Within 15 days, Rommel had lost half his tank force, a large part of his air support and more than half his manpower. By Nov. 7 his shattered armies had scurried 240 mi. backward toward the Libyan frontier, with the British in hot pursuit. On Nov. 11 Churchill told the commons that 59,000 Germans and Italians had been killed, wounded or captured in the early stage of the great battle.

As Rommel's remnants fled before the Eighth army in Egypt, a large force of British and American troops were landed in Morocco and Algiers on Nov. 8. (*See* below.) With his principal base of supplies, Tripoli, threatened by a possible American drive from Algeria and with his armies virtually shattered by the powerful British force, Rommel had no alternative but to retreat toward Tripoli.

Meanwhile the British Eighth army drove on westward. On Nov. 13 the Eighth army was almost at Tobruk, hot on the heels of the fleeing Afrika Korps. Rommel, having lost most of his armour and artillery, and with a force reduced to 25,000 men, made speed his first object. He abandoned all equipment that hampered his retreat, and the British armies that occupied Bengasi on Nov. 21 found the streets of the Cyrenaican port piled high with German war materials. Heavy rains in late November slowed the British advance, giving Rommel a brief respite to regroup what little was left of his Afrika Korps. The British opened a new offensive, and Rommel, whose army had been stripped of its mechanized equipment, resumed his retreat down the coast road toward Tripoli. But the British advance, though swift, was not all smooth sailing. Rommel studded the path of his retreat with skilfully concealed mine-traps which had to be cleared. By the middle of Jan. 1943 Montgomery's Eighth army was within 100 mi. of Tripoli. Two columns had passed through Misurata without encountering serious opposition, and on Jan. 24, 1943, Tripoli fell. Rommel's forces retreated into Tunisia and took up positions behind the Mareth line, a miniature Maginot defense system built by the French before the outbreak of World War II, and which was intended to protect Tunisia's eastern borders against a possible Italian attack. The arrival of Montgomery's armies before the Mareth line ended one of the longest military chases in history. In about 15 weeks, the British Eighth army had advanced more than 1,500 mi.

Invasion of French North Africa.—On Nov. 8, 1942, a large Anglo-American army landed on the shores of Algeria and Morocco, and opened a new front in Africa. The basic strategy of this campaign, which was co-ordinated with the British offensive against Rommel in Libya, was to oust the axis armies from the southern shores of the Mediterranean. The two allied armies, pressing their drives in unison, were to function as a giant press which would close tight on Tunisia and squeeze Rommel out of Africa. Their success would open the Mediterranean to allied shipping, and provide the United Nations with bases in Africa from which to invade southern France, Italy or the Balkans, which had been described as the weak spot or the "soft underbelly" of Hitler's defenses in Europe. Some allied observers enthusiastically hailed the new African front as an answer to Russia's repeated demands for the opening of a second front to divert German troops from soviet soil. The Russians, however, regarded this campaign at best a minor diversionary operation.

The invasion of French Africa was principally a political conquest. Long before the landings, U.S. diplomatic agents in Vichy and in Vichy-controlled Algeria and Morocco had sounded out French sentiment with regard to American occupation and had reported favourable findings to the allied high command. In October an American military mission landed secretly at a lonely spot somewhere on the North African coast, conferred with French officers of pro-allied sympathies and received assurances that American landings would meet with little resistance. A month later a huge armada of 500 troop transports and 350 warships steamed toward appointed landing zones on the Atlantic and Mediterranean shores of French North Africa. On the morning of Nov. 8, U.S. troops swarmed ashore near the harbours of Algiers, Oran, Casablanca and other French ports. Algiers fell with little resistance by nightfall; French garrisons in Oran and Casablanca put up a stiffer fight, although Oran surrendered on Nov. 10 and Casablanca a day later. After the fall of Casablanca, all French troops obeyed a cease-fire order issued by Adm. Jean Darlan, and all Morocco and Algeria passed under allied control. As a result of the allied landings, Hitler on Nov. 11 ordered axis troops to occupy all France. He temporarily spared the French naval base at Toulon, hoping that the French fleet based there would join the axis. But on Nov. 27, fearing that the French navy was no longer "trustworthy," he ordered his troops to seize the fleet. The French had long anticipated this move, however, and they scuttled the majority of the 60-odd warships before the Germans could seize them.

The Anglo-American drive in Tunisia got under way a few days after the initial landings. In the van was the British First army, led by Gen. K. A. N. Anderson, which attempted to speed its way to Tunis and Bizerte and

BRITISH six-pounder anti-tank gun firing in the El Alamein sector, Egypt, before the 8th army's great drive against Rommel's Afrika Korps began Oct. 23, 1942 crush axis opposition before reinforcements could arrive. German panzer units, however, slowed Anderson's drive, while axis transport planes ferried troops across the narrow Sicilian channel to Tunisia at an estimated rate of 1,500 daily. At the end of the year, the axis armies had grown from a mere 10,000 to an estimated 50,000 men. Some observers said the armies under Gen. Von Arnim exceeded 100,000 troops. The entire Anglo-U.S. force in French North Africa was believed to total about 150,000 men, the majority of whom were British. Another force of between 100,000 and 150,000 troops, drawn from the French armies in Africa, was available for allied operations, but lacked equipment.

The British First army, advancing along the coast road, was able to occupy Bone and Bougie by the middle of November. It then cut through the mountain passes to the southeast and drove the Germans out of Medjez-el-Bab and captured Djedeida, a small town 35 mi. east of Bizerte, on Nov. 19. German tank units counterattacked while low-flying dive-bombers destroyed bridges and roads to the rear of allied forces, disrupting their supply system. A fluid war of movement developed with German panzer stabs countering allied tank thrusts. By the middle of December nazi resistance hardened and a relatively stabilized front began to take shape. Gen. Anderson's First army held the left flank of allied forces at Mateur. The newly organized American Fifth army defended the centre at Medjez-el-Bab, while French forces held the right flank anchored at Pont-du-Fahs. The allied line ran in a north-south direction from a coastal point about 25 mi. west of Bizerte to the shores of the Djerid salt lake on the south, and was about 200 mi. long.

By Jan. 15, 1943, the allied advance on Tunisia was stalled. German dive-bombers were continuously in action, mercilessly strafing and bombing allied ground forces in the barren Tunisian mountains. German veteran tank units systematically chopped up the inexperienced American tank crews in a series of local battles and by the end of Feb. 1943 it was evident that the axis did not intend to relinquish Tunisia without the fiercest kind of a struggle.

VII.—MADAGASCAR

The island of Madagascar, close to Africa and controlling the British supply route around the Cape of Good Hope to Suez, was coveted by belligerents of both sides. The British had reason to believe that the Japanese, after the capture of the Andaman islands, would seize the island either by force or through Vichy treachery, and thus cut off the last supply route to the middle east.

In order to forestall Japanese invasion, a British naval force, including an aircraft carrier and two transports, landed a small force of shock troops on the island on May 6, 1942. After establishing beachheads at Courrier bay, the ground forces attacked the naval base at Diégo Suarez, capturing it on the following day. In early July the British occupied Mayotte island, 250 mi. northwest of Madagascar, and then resumed their offensive in Madagascar. Tananarive, the capital, fell to British troops on Sept. 23, and by early October almost all the island, including its important ports and the railway system, was in British hands. After another month of apathetic fighting, hostilities ceased and an armistice was signed, Nov. 5. The British then placed Fighting French authorities in control of the island.

VIII.—THE BATTLE OF THE ATLANTIC

The defense of convoys from U-boat attack was the great problem of the battle of the Atlantic in 1942. High shipping losses meant not only loss of valuable war material, but required the building of replacements which seriously strained shipyard capacity. The intensity of the U-boat drive was evidence that Germany, aware of the increasing importance American factories would play in the war, was determined to choke off the flow of American war supplies to England, Russia and Africa.

The German admiralty began its submarine campaign against coastwise shipping on the eastern shores of the United States in Jan. 1942. Nazi undersea raiders, operating in packs, ranged the unprotected coastline between Maine and Florida and took an ever-increasing toll of oil tankers, merchantmen and freighters. Soon supply ships were being torpedoed in the St. Lawrence and at the mouth of the Mississippi, and oil refineries in Aruba and Trinidad were shelled by U-boats. By April 1942 it was estimated that sinkings on the Atlantic coast alone matched or outstripped the building of new ships. By June 1942 the announced losses totalled 332 ships. These figures were believed to be far below the actual count, which was not revealed by the American or British naval commands.

Unprepared at the outset to cope with intensive submarine attack in its own waters, the United States began to develop effective anti-submarine measures in the spring of 1942. The coast guard received new anti-submarine vessels, and aerial patrols of the offshore waters were established. By May of 1942 an effective convoy system to protect merchantmen plying the Atlantic coastal waters had been placed in operation. In July the convoys were extended to cover merchantmen in the Gulf coast and the Caribbean zones.

The establishment of convoys, it was generally believed, resulted in a substantial reduction of sinkings in the western Atlantic. But losses in the middle Atlantic, the Gulf coast, the Caribbean and along the route to Murmansk increased at an alarming rate. It was reported that ship losses in May and June were phenomenally high, perhaps the largest in history to that date. The Murmansk route became a marine graveyard, littered with allied merchantmen sunk by co-operative action of submarine packs and dive bombers.

Thus, the Germans claimed the destruction of 38 merchantmen out of a convoy of 45, travelling the Murmansk route, on Sept. 13.

Another drain was imposed on allied shipping by the opening of the North African front in Nov. 1942. The necessity of providing strong escorts for the Africa-bound convoys resulted in the diversion of naval strength from the other transatlantic convoy routes. The U-boats immediately shifted their attacks to the more vulnerable sea lanes, and, by December, allied merchantmen were being sunk at the rate of two a day.

The big shipbuilding program of the United States was expected to offset the submarine casualties to some degree. In 1942 American shipyards produced 8,090,000 tons of merchantmen, while the output of British yards was believed to be more than 2,000,000 tons. At the end of the year, American losses were reported substantially reduced, but total allied losses were not lessening. The German admiralty claimed that its submarines, aircraft and surface raiders sank nearly 9,000,000 tons of allied shipping in 1942. A reliable source was authorized to announce that United Nations shipping, presumably toward the end of the year, was being destroyed at the rate of 1,000,000 deadweight tons a month. Thus over-all losses of the allies were believed to have been as great in December as they were in June. It was also said that the German submarine fleet in 1942 was eight times as large as it was in 1940. Despite heavy and frequent allied air attacks on German U-boat bases and submarine shipbuilding yards in Germany and on the coast of France, axis shipyards in late 1942 were reported turning out submarines at a rate of 25 per month. There were frequent charges in American newspapers, in early 1943, that the United States and British naval commands, by refusing to reveal their shipping losses on the ground that such disclosures would be giving valuable information to the enemy, were deliberately concealing the gravity of the U-boat menace.

American shipyards were scheduled to produce more than 16,000,000 tons of merchantmen in 1943. But even this record output could not be expected to solve the submarine problem so long as the United States and Britain did not realize their program to build enough destroyers and escort vessels to protect their farflung convoy routes.

There were few major naval engagements of importance in the Atlantic or in the Mediterranean in 1942. After the loss of the "Bismarck" in 1941, the Germans avoided using their few remaining large ships as commerce raiders in the middle Atlantic, and left this task to the submarines and planes. German bombers, surface vessels and U-boats worked together, however, in attacking allied merchantmen on the supply route to Murmansk. These co-ordinated air and sea raids were developed to a high peak of efficiency, particularly in the Mediterranean, where British convoys bound for Malta engaged in several pitched battles with Italian warships covered by axis bombers. R.A.F. units, operating from bases on Malta, frequently came to the aid of the convoys, screening them against air attack. Losses on both sides in these air-and-sea battles were heavy, and a substantial number of warships was sent to the bottom by bombs and aerial-launched torpedos.

The British suffered heavy losses in getting supplies through the narrow enemy-infested Sicilian channel between Sicily and Africa. On Aug. 11, a pack of axis submarines and a squadron of planes pounced on a strongly-escorted British convoy, sinking the aircraft carrier "Eagle," the cruiser "Manchester," an anti-aircraft cruiser and a destroyer. The axis lost 66 planes, 2 U-boats and 2 E-boats in this engagement.

A brilliant German operation demonstrated the effectiveness of the air arm in naval warfare. The battle cruisers "Scharnhorst" and "Gneisenau" and the cruiser "Prinz Eugen" had been confined to Brest harbour since 1941. Strong British naval forces lay at hand to engage them should they venture forth, and they were bombarded incessantly by R.A.F. squadrons. The German admiralty decided that swarms of German land-based fighter planes, rising from the airfields which had been constructed on the French channel coast, could be utilized to shield the vessels from hastily organized British attack, if they should make a sudden break through the channel to the North sea.

The plan was successful. On Feb. 11, 1941, the ships dashed out of Brest harbour with an escort of light, fast naval units. A dense channel fog enabled them to avoid detection until 11 A.M. on Feb. 12, when a hastily mobilized British force of aircraft, destroyers and torpedo boats attacked. But in a five-hour battle, in which more than 600 planes participated, the British were unable to break through the air and sea screen protecting the German warships and they steamed on into German harbours.

IX.—NAVAL WARFARE IN THE PACIFIC

In the Pearl Harbor attack eight American battleships were sunk or put out of action. Three days later, the British capital ships "Prince of Wales" and "Repulse" were sunk. These disasters combined to give Japan temporary naval supremacy in the Pacific at the outset of the war. The blow at Pearl Harbor enabled the Japanese to cut the United States lifeline to the Philippines and facilitated the Japanese conquest of Guam and Wake islands. The loss of the two British dreadnoughts put Singapore in a great peril. As a result of the two disasters, the allied navies had only a fleet of light cruisers and destroyers with which to challenge Japan's drive to the south. A prominent feature of both battles was the leading part played by Japanese aviation. At Hawaii, Japanese carrier-based planes destroyed American planes before they could leave the ground and scored direct hits on the battleships moored in Pearl Harbor. The sinking of the two British warships was a brilliant operation by land-based planes.

These initial Japanese successes in the Pacific showed the striking difference between Anglo-American and Japanese concepts of naval strategy at the time of Pearl Harbor. Anglo-American naval strategy was based on the battleship as the major offensive weapon. The Japanese, on the other hand, operated their land, sea and air forces together as a unit, placing emphasis on a particular arm at any time as circumstance might indicate. The primary function of the Japanese fleet was to escort troop transports and to cover landing parties, not to engage in decisive naval actions.

Battle of Makassar Strait.—But the avoidance of naval engagements was possible only with the adversary's acquiescence. Although the allied navies were outnumbered and lacked adequate air protection, they were determined to fight nevertheless. The first major naval clash of 1942 occurred on Jan. 24, when an allied task force attacked a large enemy convoy bound for the Dutch East Indies. For two consecutive nights allied destroyers and cruisers, aided by planes, bombarded the enemy convoy, which was caught in the Strait of Makassar, a narrow channel between Borneo and Celebes. No official estimate of the damage was published, although the United States navy declared that the Japanese suffered heavily and that one American destroyer was damaged.

Battle of the Java Sea.—Despite the American success in the Makassar strait engagement, the Japanese continued to pour troops into the Dutch East Indies. They closed in on Java, chief Dutch Indies stronghold, and by Feb. 25 a Japanese armada consisting of 40 transports escorted by 9 cruisers and 2 destroyer flotillas, was moving from the north across the

Java sea. British, American, Dutch and Australian naval forces, consisting of 5 cruisers and 16 or more destroyers, assembled and attacked the Japanese force on Feb. 27. After two days of sustained fighting, 19 allied ships, including the entire cruiser force and an American aircraft tender, had been sunk. Two American destroyers, all that was left of the allied fleet, broke through the Japanese naval cordon to safety. Only two enemy ships were reported definitely as having been sunk, although subsequent reports from Dutch sources said that many of the Japanese transports had gone down in flames. The battle of the Java sea was a staggering naval defeat for the allies and it sealed the doom of Java.

Naval Operations in the Indian Ocean.—After the conquest of the Indies, Japanese naval forces extended their operations to the Indian ocean, where, on April 9, Japanese planes caught the British cruisers "Dorsetshire" and "Cornwall" and sank them. The following day, Japanese bombers sank the British aircraft carrier "Hermes" in nearby waters.

Battle of the Coral Sea.—In early May, Japan's string of naval triumphs came to an end with the battle of the Coral sea. American carrier-based planes spotted a Japanese task force, presumably escorting a convoy, headed southward toward New Caledonia and New Hebrides. On May 4, carrier-based dive bombers from an American task force sank a light cruiser and two destroyers before the Japanese could retreat beyond bomber range. On May 6, the United States carrier bombers and torpedoplanes located a section of the Japanese forces and sank an enemy carrier and a cruiser in a five-minute raid. On May 7, the Japanese fleet finally located the American forces. Both Japanese and American planes took to the air and engaged in wild dogfights. While the United States aircraft were battering a Japanese aircraft carrier and setting her ablaze, Japanese dive bombers and torpedo craft attacked the American carrier "Lexington," damaging her so badly that she had to be abandoned and sunk by American torpedos. When the battle was over on May 7, the Americans had won their first complete naval victory. Seven Japanese warships, including a carrier and several transports, had been sunk. American losses were a carrier and two other ships. The battle of the Coral sea was unique in the history of naval warfare. It was the first major sea engagement fought entirely by planes from carriers. The surface ships apparently never came within gun range of each other and the only broadsides fired were at attacking planes.

The Battle of Midway.—A month after the battle of the Coral sea, a powerful Japanese force of some 80 ships, including 3 battleships, 4 or 5 carriers, and a number of transport and supply ships, struck eastward toward Midway and the Aleutians. The Japanese aims were apparent: to capture Midway as a steppingstone for an all-out assault against Hawaii. A small section of this fleet veered off toward the Aleutians to protect the northern flank. But the American forces were on the alert and when battle was joined at dawn on June 4, Midway's entire shore-based aircraft attacked the main Japanese striking force. At the same time, Midway's shore defenses and fighter craft crushed a Japanese dive-bomber attack on the island. The Japanese started a prudent withdrawal. But planes from American carriers pursued the retreating armada, bombing carriers and battleships. When the battle ended on June 7, American bombers had sunk 4 carriers, 2 cruisers and 3 destroyers, and had damaged 3 battleships and 4 cruisers, as well as a number of lighter ships. An estimated 275 Japanese planes were also shot down. The Americans lost the carrier "Yorktown" and a destroyer. While United States plane losses were not given, American air personnel casualties in the Midway battle totalled 307 officers and men.

The battle of Midway was similar to the battle of the Coral sea in that no surface vessels exchanged fire and that damage sustained on both sides was exclusively from air and submarine action. The battle of Midway, however, was a much more decisive victory since it halted a major Japanese effort to capture Midway and Hawaii and destroy the United States Pacific fleet.

The Battle of Savo Island.—The next naval engagement of importance was the battle of Savo island, fought at the beginning of the invasion of the Solomons. On the night of Aug. 9, Japanese vessels slipped through allied patrols and surprised the main allied fleet. After a two-day battle, four allied ships, the American cruisers "Astoria," "Quincy" and "Vincennes" and the Australian cruiser "Canberra," had been sunk. This naval defeat almost wrecked the American invasion of the Solomons, for it crippled the allied naval force holding open the supply lanes to the embattled marines on Guadalcanal.

However, in the battle of Cape Esperance later, American ships and planes succeeded in trapping a Japanese fleet trying to land reinforcements on Guadalcanal. The Americans sank six of the Japanese ships, losing only one destroyer.

The Battle of Santa Cruz.—As the Solomons campaign developed, Japanese planes, warships and undersea craft repeatedly raided American naval forces. A Japanese submarine sank the aircraft carrier "Wasp." As the American naval defense weakened, the Japanese landed more forces on Guadalcanal; and in early October, a major Japanese naval and transport force was concentrated in the northern Solomons. An American task force under Vice-Adm. William F. Halsey, who had succeeded Vice-Adm. Robert L. Ghormley at the head of American naval forces in the Pacific, intercepted the Japanese force as it moved southward near Santa Cruz on Oct. 25. A two-day battle ensued in which the Americans lost the first-line carrier "Hornet" and a destroyer. American fliers, however, sank 2 destroyers and damaged 2 carriers and 2 battleships; and the Japanese fleet was compelled to withdraw for repairs. Although the result was indecisive, Americans obtained a badly needed breathing spell.

Battle of the Solomons (Guadalcanal).—The Japanese retired, but less than a month later they made another bid to recapture the Solomons. A Japanese fleet of transports, screened by several battleships and a force of cruisers and destroyers, steamed southward from the Shortland area. They were met by an American cruiser-destroyer task force which attacked the battleships at close quarters on Nov. 13. The American cruiser force was hard hit, but succeeded nevertheless in disorganizing the Japanese. On the night of Nov. 14, American battleships closed in on the Japanese fleet and after a violent two-day battle, the Japanese limped away. The Japanese had been almost annihilated: 28 warships and transports, including a battleship, had been destroyed. The Americans had won a decisive victory and had strengthened their hold on Guadalcanal.

Japanese naval losses in the Pacific were far greater than American losses, according to American claims. Tallies kept by American newspapers and based on U.S. navy figures placed the proportion of Japanese losses to American losses at between three and four to one. Nevertheless, the Americans were not able to attain naval parity with the foe in the Pacific. The United States naval building program aimed to correct this disparity, but this means of attaining the goal would not be effective for a long time.

Naval Raids.—In addition to the naval engagements, U.S. naval forces also staged three raids on Japanese island bases far removed from the major battle zones of the southwest Pacific. The first occurred on Jan. 31, 1942, when an American task force comprising aircraft carriers, cruisers and destroyers, struck a surprise blow at principal Japanese bases in the Marshall and Gilbert islands. Sixteen ships, including a cruiser, were sunk; and port and shore installations were demolished in the raid, which was intended to prevent the Japanese from using these islands for raids on allied communications. A similar raid was conducted against Japanese-held Wake island on Feb. 24 and another against Marcus island—less than 1,000 mi. from Japan—on March 24, although the damage done was less extensive. On Aug. 17, an American marine force, landed from submarines, attacked the Japanese garrison on Makin island and slew approximately 700 of the defenders. After a 40-hour battle, the marines escaped to their own craft with few casualties. The raid was conducted along Commando lines and was apparently staged to obtain information about enemy dispositions in the Gilbert islands.

A great fleet of U.S. submarines, conducting a campaign similar to the axis U-boat drive in the Atlantic, inflicted severe losses on Japan's merchant fleet. Japan's situation in the Pacific was comparable to England's position in the Atlantic. Like England, Japan was dependent on shipping, for imports to keep her war industries going and to supply her troops in the new conquests in the Pacific. Although few details of American submarine warfare against Japan had been revealed at the close of 1942, one salient fact emerged: that the American submarine raiders sank between 100 and 150 enemy ships in 1942. It was also estimated that Japan's total shipping losses were in excess of 1,000,000 tons and that the rate of destruction in 1942 was twice the rate of Japan's construction.

Wrestling. Oklahoma A. and M. college wrestlers completely dominated the amateur phase of the mat sport. The Oklahomans won both the National college and National A.A.U. championships, taking the collegiate title as members of Oklahoma A. and M. and the A.A.U. championship as members of the Crescent club, Tulsa. Dave Arndt, 145 lb., and Vernon Logan, 155 lb., were crowned champions in both meets. Two brothers from the University of Michigan, Merle and Burl Jennings, repeated their championship conquests in the 121- and 128-lb. divisions of the collegiate meet. Professional wrestling continued on its lackadaisical way, with interest so low that only two or three claimants to the world championship existed at the end of 1942. (M. P. W.)

Wyoming. A Rocky mountain state, admitted to the union July 10, 1890, as the 44th state. Leadership in the extension of rights to women gave it the name "Equality state." Land area, 97,506 sq.mi.; water area, 366 sq.mi.; pop. (1940) 250,742. The rural population was 157,165; urban, 93,577; 229,919 native white, 950 Negro, 17,107 foreign born. Capital, Cheyenne (22,474). Other principal cities: Casper (17,964); Laramie (10,627); Sheridan (10,529).

History.—Elective state officials in 1942 were: governor, Nels H. Smith (R.); secretary of state, Lester C. Hunt (D.); auditor, William Jack (D); treasurer, Mart T. Christensen (R.); superintendent of public instruction, Esther Anderson (R.). Elected in Nov. 1942 to take office in 1943 were: governor, Lester C. Hunt (D.); secretary of state, Mart T. Christensen (R.); auditor, William Jack (D.); treasurer, Earl Wright (R.); superintendent of public instruction, Esther Anderson (R.). There was no meeting of the state legislature in 1942.

Education.—In 1942 there were 837 elementary schools with an enrolment of 40,125 and 1,887 teachers. There were 117 high schools with an enrolment of 15,123 and 820 teachers.

Public Welfare, Charities, Correction.—WPA furnished 10,500 man months of employment during 1942. WPA employment declined from 1,836 assigned workers in January to 325 workers in December. The average for the year was approximately 875 workers. The state department of public welfare reported $1,072,010 spent in old-age assistance (42,489 cases); $288,847 spent in aid to dependent children (8,525 cases); $45,175 spent in aid to the blind (1,609 cases); and $425,396.05 spent in general relief (12,898 cases). Wyoming has three correctional institutions: penitentiary, industrial institute for boys, and girls' school. On Dec. 1, 1942 the penitentiary had 232 inmates, the industrial institute for boys, 48 and the girls' school, 90. State expenditures during 1942 were $219,215.22 for the penitentiary, $81,074 for the industrial institute for boys and $62,366.92 for the girls' school.

LESTER C. HUNT, Democrat, elected governor of Wyoming Nov. 3, 1942

Communications.—In 1942 there were 23,000 mi. of roads, of which 3,400 mi. were hard surfaced. The state highway department spent approximately $3,000,000 during the year ending Sept. 30, 1942. There were 1,991.98 mi. of railroad in the state.

Banking and Finance.—There were 31 state banks and 26 national banks in Wyoming on June 30, 1942. The state banks had deposits of $22,161,867.78 and resources of $25,222,280.08. The national banks had deposits of $57,845,710.94 and resources of $64,380,687.28. In 1941 the state had nine insured savings and loan associations with assets of $4,598,860. For the biennium ending Sept. 30, 1942, the total of state receipts was $30,542,919.96; total disbursements, $28,259,630.36.

The state's gross bonded debt, as of Sept. 30, 1942, was $3,528,500.

Ranching and Agriculture.—Wyoming livestock products sold for approximately $60,741,000 in 1942, and farm crops were valued at $31,479,120.

Shortage of harvest hands, untimely rains and early frosts curtailed agricultural production.

Table I.—*Leading Ranch and Farm Products of Wyoming, 1942 and 1941*

Product	1942 (est.)	1941
Cattle	362,000	287,000
Sheep	1,940,000	1,914,000
Wool, lb.	34,500,000	34,000,000
Hogs	130,000	110,000
Tame hay, tons	825,000	1,441,000
Wheat, bu.	4,856,000	5,598,000
Sugar beets, tons	500,000	526,000
Dry beans, cwt.	1,092,000	667,000
Corn, bu.	2,466,000	2,928,000
Potatoes, bu.	2,660,000	2,550,000

Manufacturing.—The value of all manufactures, excluding oil refining and dairying, was estimated at $10,000,000 in 1942, a considerable drop from an estimate of $26,000,000 in 1941.

Table II.—*Principal Industries of Wyoming, 1939 and 1937*

Industry	Value of products	
	1939	1937
Petroleum refining	$24,671,993	$29,993,494
Bread and other bakery products	1,315,075	1,419,501
Butter	968,000	1,076,855

Mineral Production.—The total value of Wyoming's mineral production in 1942 was estimated at $207,250,000. Petroleum was the principal mineral product as usual. The largest producer among numerous fields was Lance Creek.

Table III.—*Principal Mineral Products of Wyoming, 1942 and 1941*

Mineral	Value, 1942	Value, 1941
Petroleum (refined value)	$180,000,000*	$165,000,000*
Bituminous coal	20,000,000	18,750,000
Iron	4,000,000	3,500,000
Bentonite	1,750,000	1,500,000

*Estimates of state minerals supervisor; figures include oil refined in state, oil used on roads and oil piped outside state for refining.

(A. T. L.)

X-Ray.

Important reports were made upon an acute disease of the respiratory system widespread in many localities in which X-ray examination of the chest is of great value in diagnosis. Usually called "virus pneumonia" it received various names, among them acute diffuse bronchiolitis, acute pneumonitis, influenzal pneumonitis and atypical pneumonia. It is probably best to refer to it as "atypical bronchopneumonia" since a virus agent was proved to be the cause in only a small number of cases.

Excellent descriptions of the disease were given by Daniels and by Goodrich and Bradford. It differs from the common types of pneumonia in the absence of identifying organisms in the sputum, few physical signs other than rales, leukopenia instead of leucocytosis, and in its relatively low mortality. With regard to the latter, Goodrich and Bradford stated that "The increasing incidence and severity of virus type pneumonia indicate a rising virulence of the etiologic agent." The disease also differs from other pneumonia in that it fails entirely to respond to the sulphonamide drugs.

The X-ray changes revealed in the lungs include small, diffuse, patchy areas of increased density, a fine hazy or cloudy appearance which may involve a large area or an entire lobe, dense areas which closely simulate the consolidation seen in lobar pneumonia, and widespread miliary dissemination. A common characteristic is the tendency for the involvement to change its location to different parts of the same lung or to the opposite side and to completely disappear in one locality while another becomes involved. In at least half of the cases both lungs are ultimately involved.

These "atypical pneumonias" often closely simulate the X-ray appearance of pulmonary tuberculosis, so much so that it is sometimes impossible to distinguish one from the other. In all doubtful cases decision must be delayed until another X-ray examination is made after an interval of about three months. It is characteristic of the disease that the X-ray changes in the lungs in "virus pneumonia" may persist long after all clinical signs of the disease have disappeared, even as long as three months.

An improvement in the X-ray diagnosis of protrusion of intervertebral disks into the spinal canal was made during 1942. The method which was increasingly used for several years was the injection of lipiodol into the spinal canal. The principal objection to its use was the fact that a "foreign body" is left in the canal. Kubie and Hampton devised a method for removal of the iodized oil after the X-ray examination is made. Klemme, Scott and Woolsey perfected the procedure by the use of a special needle provided with a second opening which allows a free flow of the oil and its removal by suction.

Many cases of a condition called "march fracture," recognized for many years, were being reported among soldiers. It usually occurs in the metatarsal bones and is demonstrated as a narrow fracture line in good roentgenograms. In some cases the fracture line is not demonstrated but in one to three weeks the roentgenogram will show a spindle-shaped callus around the shaft of the bone. Two cases of "march fracture" of the femur were reported from England. The faint fracture line with subsequent periosteal reaction and callus formation may be mistaken for more serious conditions such as sarcoma or Ewing's tumour unless the possibility of "march fracture" is kept in mind. (*See* also PHOTOGRAPHY; TUBERCULOSIS.) (A. C. CH.)

Yachting. While World War II had a drastic effect on yachting everywhere, its influence on the sport in the United States was less pronounced than elsewhere and the season of 1942 saw considerable activity, with racing schedules about as usual, but in nearly every instance with reduced fleets. Not only were there fewer yachts racing, but those that were out consisted of the smaller classes and very few of the larger yachts, either cruising or racing, were in commission. Most of the large yachts suitable for naval duty had been taken over by the navy or coast guard, and these included many large auxiliary cruisers and ocean racers that had formed the backbone of the yachting fleet. There was, of course, no building of new boats or classes, and no development in yacht design.

While the great fleets of other years that gathered for the two principal east coast yachting events, Larchmont race week and Marblehead's midsummer series, were missing, the turnout for both was good, with an average of 161 starters for the five race days at Larchmont and of 182 at Marblehead. On the west coast, wartime restrictions on the movements of yachts curtailed all the principal intersectional events.

On the Great Lakes, with fewer wartime restrictions, the sport was less affected. This region was the only one to sail long-distance events, ocean sailing being prohibited on the coasts. The classic Chicago-Mackinac race drew 30 starters. The Mackinac cup was taken by the cutter "White Cloud," owned by C. E. Sorensen, of Detroit, in 38 hours 14 minutes, elapsed time, the second fastest in the long history of the race. In the racing division, "Falcon II," owned by L. L. Karas and Clare Udell, was the winner of the 333-mi. event. The Port Huron-Mackinac race, the other big long-distance event on fresh water, drew 19 starters and the winners were "Hostess II," C. W. Beck, Jr., owner, and "Shamrock," Ernst Grates, owner, in the racing class.

International competition was, of course, out of the question and, while the International Star class sailed its championships, the only foreign entry was from Cuba. This race, held on Lake Michigan, was sailed for the first time in boats furnished by local fleets. It was won by Harry G. Nye, Jr., representing the Southern Lake Michigan fleet. The next championship event in the class was scheduled to be sailed in Cuba. The Star midwinter championship trophies, sailed for off Havana in January, went to Havana and Nassau boats. Charles de Cardenas, in "Kurush II," won the Cup of Cuba and A. de Marigny's "Concubine" took the Bacardi cup.

In the Intercollegiate Yacht Racing championship, sailed off Oyster Bay, five colleges were represented in the series for the McMillan cup. It was won by Dartmouth, with Harvard second. In the absence of international events, national championships in the big one-design classes took on added importance. In the popular Lightning class, which brought out 18 boats, the winner was David G. Cluett, representing the Cedarhurst, L.I., fleet. The Snipe class international title race, sailed on Lake St. Clair, saw 21 fleets competing and the winner was Ralph Heinzerling, of Lake Lackawanna, N.J. In both the Comet and the Penguin classes, national championships were cancelled due to the difficulty of transporting boats under war conditions. The various Junior championships of national importance were also cancelled. (H. L. ST.)

Yale University. An institution of higher education at New Haven, Conn. Outstanding during the academic year 1941–42 was the organization of students and faculty for participation in the war. The four-year curriculum was accelerated so that undergraduates could complete the same studies in two years and seven months. Simultaneously, requirements for the Master's degree were reduced from two years to one. A bureau of military information and a committee on student preparation for war service were established to guide students enrolling in reserves of the army, navy and marine corps. A total of 98% of the student body returned for the first Yale summer term since the Civil War, and 85% registered in the enlisted reserves.

Faculty members numbering approximately 225 left the university to serve in the armed forces, industry and government, while another 100 performed war tasks on the campus. Secretary of the Navy Frank Knox congratulated Yale on its "assumption of leadership in preparation for the war." The Yale unit, U.S. military hospital No. 39, was called to duty and began service overseas.

Many subjects received more emphasis than previously, including far eastern languages, with greatly increased enrolments in Japanese, Russian, Malayan and Chinese. For statistics of faculty, enrolment, endowment, etc., *see* UNIVERSITIES AND COLLEGES.

Yamamoto, Isoroku (1884–), Japanese naval officer, was born in April. He was graduated from the naval academy in 1904 and fought as an ensign in the Russo-Japanese war. He was naval attaché in the Japanese embassy in Washington, 1925. As Japanese delegate at the London naval conference in 1934–35, he successfully fought the Anglo-American proposal to extend the naval "holiday." The talks foundered on the issue of parity between the U.S. and Japan, and Yamamoto won rapid promotion for his work in London. Foremost Japanese advocate of combining air and sea power in naval attacks, he was promoted to commander-in-chief of the fleet in 1939. Referring to the Japanese surprise attack on Pearl Harbor, Domei (Japanese) news agency revealed in a dispatch on Dec. 17, 1941, that the strategy of surprise carried out by Adm. Yamamoto was planned by him earlier. Despite heavy Japanese naval losses in the Coral Sea, Midway and Solomons naval battles, Japanese communiqués insisted on regarding these defeats as "victories." After the Coral Sea battle in May, Premier Tojo congratulated Yamamoto on his "brilliant" achievements in this engagement.

Yamashita, Tomoyuki (? –), Japanese army officer, was a close student of German military tactics. An able strategist, he trained Japanese soldiers in the technique of jungle warfare and conceived the military plan for the Japanese invasion of Malaya, 1941–42. His troops infiltrated the Malayan wilderness as independent units and, aided by native fifth columnists, successfully marched through narrow jungle roads and paths that the British general staff thought were impenetrable. After a 10-week campaign, Singapore surrendered to Gen. Yamashita on Feb. 15, 1942. On March 9, after the failure of Gen. Masaharu Homma's drive to dislodge the U.S.-Filipino forces from the Bataan peninsula, Gen. Yamashita assumed command of the Philippines campaign. With a numerically superior army and air force, he won the battle of Bataan, April 9 and conquered the Corregidor island fortress, May 6, 1942.

York, Archbishop of

(CYRIL FORSTER GARBETT) (1875–), English divine, was born on Feb. 6 and educated at Portsmouth Grammar school, Keble college and Cuddesdon, Oxford. He was ordained in 1899 and after various minor appointments became in 1909 vicar of Portsea, one of the most important parishes in Great Britain. There he made his reputation as the best organizer, administrator and trainer of junior clergy in England, displaying in his methods an inflexible discipline. His other dominant interests were housing, sweated labour and education.

On his appointment as bishop of Southwark in 1919 he acquired an unequalled first-hand knowledge of slum conditions. On his translation in 1932 to the historic diocese of Winchester he began his famous hiking expeditions, visiting the people in their own villages and homes and earning the reputation of being the greatest pastoral bishop and diocesan model in England. On his translation to York as archbishop in 1942 he immediately began similar hiking expeditions throughout the great diocese, where little villages that had not seen an archbishop for generations saw him in their midst talking to men clipping hedges, visiting women in their tiny cottages and bringing comfort to lonely, hard-pressed, single-handed clergy.

His later publications include *A Call to Christians* (1935); *The Church and Social Problems* (1939); *What is Man?* (1940).

Younghusband, Sir Francis (Edward)

(1863–1942), British soldier, explorer and author, was born May 31 in Murree, India. He led a British expedition to the forbidden city of Lhasa and negotiated a treaty with the Dalai Lama of Tibet in 1904. A renowned authority on geography and author of a number of philosophical works, he was named head of the Royal Geographic society in 1919, and helped organize the World Congress of Faiths in 1936. Among his later works were *Dawn in India* (1930), *The Living Universe* (1933), *Modern Mystics* (1935), *Everest: The Challenge* (1936), *A Venture of Faith* (1937) and *The Sum of Things* (1939). He died at Lytchett-Minster, Dorset, England, July 31. (See *Encyclopædia Britannica.*)

Young Men's Christian Association.

In 1942 Frank S. Bayley was president; Eugene E. Barnett, general secretary. The 1942 Y.M.C.A. Yearbook listed 1,279 U.S. local associations with 1,205,797 members in cities, high schools, colleges, rural areas, railroad and industrial centres, and near military establishments. Major emphasis was given in 1942 to young men in military and related services. The Y.M.C.A., as one of the agencies composing the United Service Organizations, carried responsibility for operating 271 clubs and centres, and extended its regular facilities to service men everywhere. Work among 4,000,000 to 6,000,000 prisoners of war, conducted under the World's Alliance at Geneva, continued to expand, a fund of $1,179,000 having been raised to finance this work for the year starting Oct. 1, 1942. Important meetings of the year were the 17th National Council meeting; 5th National Young Men's assembly; 4th National Hi-Y congress; 20th International Association of Y's Men's Clubs; National Council of Foremen's Clubs; Transportation institute; National Coloured Work conference; National Council of Student Christian associations; Southern Conference of Human Relations in Industry; and the 25th Anniversary Conference on Industrial Relations at Silver Bay, N.Y. Prominent activities included the development of 24-hour service in many industrial centres; special attention to needs of boys in wartime and problems of financing and rapid growth of war chests. (O. E. P.)

Young Women's Christian Association.

The Y.W.C.A. program in the United States was adapted and expanded in 1942 to meet the new and increased needs of women and girls caused by wartime conditions, with particular emphasis on women war workers. As a member agency of the U.S.O., the Y.W.C.A. provided special services and activities for women and girls in war industries and camp areas. The American Y.W.C.A. continued to assist the Y.W.C.A.s in China, Great Britain and other war-torn countries by grants of money and personnel; and also provided emergency service for refugees, evacuees and interned women in the United States. This work was financed through its World Emergency and War Victims fund, approved by the National Budget Committee for War Appeals for inclusion in local war chests. Special events in 1942 included a conference in New York on "The Role of Women in the War Effort," for which the National Board of the Y.W.C.A. was one of the three sponsoring women's organizations; and a luncheon at the Waldorf-Astoria, given by the National board and the New York City Y.W.C.A., in honour of Lieut. Commander Mildred H. McAfee of the WAVES and Mrs. Oveta Culp Hobby of the WAACs, with about 2,000 present. In 1942, nearly 3,000,000 women and girls shared in the program of the Y.W.C.A. in its 1,480 local centres in the United States. President in 1942: Mrs. Henry A. Ingraham. (M. S. Ss.)

Youth Administration, National: *see* NATIONAL YOUTH ADMINISTRATION.

Youth Movements.

Youth movements, organized efforts at political self-expression of young people, came into prominence in 1942 by two great international representative gatherings, of which the one held at the beginning of September in Washington was a demonstration of the youth of the nations fighting the axis. The impression which this meeting made internationally was so great that Germany called a youth congress of the axis and vassal nations to Vienna in the middle of September. At the youth congress in Washington were delegates from Great Britain, the soviet union, China, Latin America and many of the countries overrun by axis tyranny. They were addressed by President Roosevelt who pledged total victory to the United Nations and promised that this time political cynicism and timidity will not be allowed to mar the emergence of a better world after the war. The ambassadors of China and of Cuba warned that peace must not only be won but enforced and called for the establishment of an effective system of collective security. Harold Butler, director of the British Information service, reminded the audience that a major task was "to promote self-government among those who have never enjoyed it." There were 350 delegates present from 53 countries.

The Vienna meeting was presided over by Baldur von Schirach, who exhorted the youth of Europe "to oppose Roosevelt, the capitalist war criminal, with the idea of a new national and social order." A European Youth federation was formed under the joint presidency of Arthur Axmann, Reich youth leader, and Aldo Vidussoni, general secretary of the Italian fascist party. Delegates from Spain, Rumania, Hungary, Bulgaria, Croatia, Slovakia and Finland, and in addition a few representatives from small nazified youth groups in Belgium, Holland, Denmark and Norway, attended. It was decided to call a second congress in 1943 to Italy. No delegates attended from the existing neutral countries in Europe, like Sweden. The task was defined as the training of future Europeans from the cradle upwards to be "obedient fighters." (*See* also CATHOLIC YOUTH ORGANIZATION.)

(H. Ko.)

Yugoslavia.

A kingdom in southeastern Europe, partitioned as a result of German aggression in 1941. Area 95,576 sq.mi.; pop. (est. Jan. 1, 1940) 15,703,000. Capital: Belgrade (266,849). Other chief cities: Zagreb (185,581); Subotica (100,058); Ljubljana (79,056); Sarajevo (78,173). Religion: 6,785,501 Greek Orthodox; 5,217,910 Roman Catholic; 1,561,166 Mohammedans; 231,169 Protestants; 68,405 Jews. King: Peter II; prime minister (1942): Slobodan Yovanovitch.

History.—Life in Yugoslavia presented throughout 1942 a very unhappy picture. The country was divided into several parts, occupied by the troops of four foreign nations and in addition torn by bitter internal strife. The main divisions of former Yugoslavia under the "new order" imposed by the axis were: a remnant of Serbia, approximately within the boundaries of 1911, under a government of the Serb general Milan Neditch, a government somewhat comparable to that of Marshal Pétain in France, its whole territory being occupied by German and Italian troops; and the independent state of Croatia (*q.v.*), thoroughly fascist and a member of the axis, its territory being occupied by Italian troops. The former Slovene part of Yugoslavia had been divided up between Germany and Italy. Germany annexed the northern part, Italy the southern part. The stubborn resistance of the native peasant population against its denationalization led to savage and violent countermeasures on the part of the Germans and Italians. Many Slovenes were driven out or sent into exile, many executed and a number of villages were entirely destroyed. Montenegro (*q.v.*) and the larger part of Dalmatia (*q.v.*) were occupied by Italy. The Serbian part of Macedonia was occupied and annexed by Bulgaria, while the fertile Serb provinces of Bachka and Baranya were occupied and annexed by Hungary. A large number of German, Italian, Hungarian and Bulgarian divisions were kept busy in Yugoslavia suppressing and counteracting the military activities of the Serbs. The unrest was increased by the internal struggle between Croats and Serbs which led to much bloodshed and bitterness, and by the actions which the axis-supported governments of Croatia and Serbia took against those elements of their nation who were striving for liberty. The number of Yugoslavs killed in various ways during the first 20 months of axis occupation was estimated between 400,000 and 600,000.

It was most difficult to get an exact picture of the operations conducted by the Yugoslav patriots against the axis forces and the satellite governments. The number of patriot troops who acted from their mountain fastnesses was estimated at certain times to be as high as 150,000. They were under the command of General Draja Mikhailovitch (*q.v.*) who had been recognized by the Yugoslav government as commander in chief of the Yugoslav armies. Under his leadership the troops of the patriot army succeeded in breaking up axis communications, controlling at various times large parts of the country and supplying themselves from provisions captured from the enemy. They also maintained a broadcasting station which was in communication with the Yugoslav government in London. Yet the problem of getting supplies became more and more difficult, as it was almost impossible to send any supplies from outside. During 1942 a serious split seems to have occurred within the patriot army. Groups of partisans, some of them inspired by communism, others by nationalism and others again probably only by the general misery and unrest, undertook operations on their own account and found themselves soon in opposition to General Mikhailovitch. Toward the end of the year accusations were levelled against General Mikhailovitch of abandoning the struggle and seeking terms with the axis powers. The Yugoslav government in London, however, expressed its unchanged confidence in the loyalty of General Mikhailovitch. By the end of 1942 the internal situation of Yugoslavia presented a rather confused picture, yet in different parts of the country, especially in those occupied by Italians, the struggle went on relentlessly, and the patriot forces could always point toward some local successes.

Meanwhile the Yugoslav government in London was reorganized at the beginning of 1942. General Dushan Simovitch was succeeded as prime minister by Slobodan Yovanovitch, a former professor of the university of Belgrade. At the same time General Mikhailovitch was appointed minister of war, and Milan Gavrilovitch, former Yugoslav minister in Moscow, was made minister of justice. The new premier was well known as a promoter of Balkan unity. Colonel Dragutin Savitch was sent to Washington as chief of a Yugoslav military mission to confer with the general staffs of the United Nations and to arrange for support of the patriot army fighting in Yugoslavia. In July General Mikhailovitch was named chief of staff and was given full military and administrative power in the Yugoslav territory. In recognition of Yugoslavia's importance the United States raised its diplomatic mission to the Yugoslav government from a ministry to an embassy, and the Yugoslav minister in Washington, Constantin Fotitch, became Yugoslav ambassador.

A very important step for the future of Yugoslavia and of the Balkans in general was taken on Jan. 15, 1942, when the Yugoslav and Greek governments signed, in London, an agreement for close co-operation and mutual support after the war, corresponding to the similar Czechoslovak-Polish agreement concluded a short time earlier. The new agreement was intended as a starting point for a wider Balkan union to which, it was hoped, the other nations, especially Turkey, would adhere. (H. Ko.)

Yukon Territory.

Yukon Territory lies in the extreme northwest of continental Canada, bounded by Alaska, British Columbia, the Northwest Territories and the Arctic ocean. Area, 207,076 sq.mi.; pop. (1941) 4,914. Seat of government, Dawson. The territory is drained by the Pelly and Yukon rivers. The severity of the climate has been subject to much exaggeration. In summer, the average day-time temperature is in the neighbourhood of 70°. In the south, the range of sunlight is from 17 to 18 hours a day, while in the north it is from 20 to 22. From June to October, steamships ply regularly from White Horse to Dawson. The territory is generally mountainous. The chief industry is mining, followed by fur trading and fishing. Soon after the opening of the Yukon gold fields annual production passed 1,000,000 oz., but in 1940 it had sunk to 80,458 oz. In 1940, 2,259,343 oz. of fine silver were produced, valued at $864,176. The fur haul the same year represented a value of $288,292. With the completion of the Canada-Alaska highway in 1942, the Yukon was brought into direct communication with the rest of Canada. Communications within the territory are maintained chiefly by aeroplane, and, during the season of navigation, by steamship. A line of railway from White Horse to Skagway (Alaska) gives access to the Pacific. Local administration is in the hands of a territorial legislative council composed of three members elected triennially, and a commissioner (lately styled controller) appointed by the Canadian government. The Yukon is represented in the dominion parliament by one member.

(J. I. C.)

Zanzibar and Pemba: *see* British East Africa.

Zeitzler, Kurt

(1895–), German army officer, was born in Luckau, Brandenburg, Germany. He volunteered in World War I and served as infantry lieutenant, resigning his commission after the armistice. He rejoined the reichswehr in 1926 as a captain, became a major in 1934, a colonel in 1935, a major general early in 1942 and then a full general. He commanded an infantry unit during the Polish campaign in Sept. 1939, and was chief of staff to Gen. Von Kleist during the Battle of France, May–June 1940. He was also chief of staff to Gen. Von Rundstedt, when the latter was in command of German armies on the French invasion coast in 1942. Virtually unknown outside Germany, Zeitzler was made chief of the German general staff, replacing Gen. Franz Halder in the winter of 1942.

Zemlinsky, Alexander von

(1872–1942), Austrian composer, was born Oct. 4 in Vienna, Austria. He studied at the Vienna conservatory, where Johannes Brahms heard his first string quartet and encouraged him to continue his work. He composed an oratorio, three symphonies and six operas, including *Sarema,* which won the Luitpold prize in Munich, Germany. Zemlinsky conducted at the Vienna Volksoper, the Vienna Hofoper and the Mannheim opera in the early 1900s. He was director of the Neues Deutsches theatre at Prague, 1911–1927, and conductor of the Berlin Staatsoper and the Philharmonic choir, 1927–32. A refugee from Vienna, he spent the last three years of his life in the United States and died in Larchmont, N.Y., March 16.

Zhukov, Georgi Konstantinovich

(? –), Russian army officer, joined the Russian imperial army as a private in 1915. After the revolution, he attended the Frunze military academy, where he received his military training under Gen. Boris Shaposhnikov, crack soviet strategist. He was named chief of the red army general staff and vice-commissar for defense, Feb. 1941. During the nazi drive on Moscow in the fall of 1941, Zhukov was given command of the capital's defense forces on Oct. 23, replacing Gen. Timoshenko, who was sent to the southern front. The German offensive at one time reached a point some 20 miles from Moscow, but there Russian armies held fast. Zhukov's armies launched a series of counterattacks; in December, German defenses cracked under the hammering Russian blows, and Hitler's armies fell back on nearly all sectors of the immense Moscow front. Zhukov was made first vice-commissar for defense on Aug. 27, 1942, and then supplanted Timoshenko on the southern front. Zhukov was credited with planning the Russian counterdrives in the Don-Volga area late in 1942.

Zinc.

The world production table for zinc, presented herewith, ends with estimated values for 1940, no data having been received from major producers other than the United States after 1939.

Mine production of zinc in the United States in 1941 was 749,125 short tons, 13% above 1940. The output of primary metal from domestic ores increased 11% to 652,599 tons, while 169,421 tons was added from foreign ores; this latter figure is a material increase over 1940, so that the total primary output of 822,020 tons was 22% above 1940. Secondary recovery included 89,656 tons as metal, 145,807 tons in alloys, and 48,404 tons in chemical products, a total of 283,967 tons and an increase of 28% over 1940. Imports during the first nine months of 1941 were more than offset by exports, 25,212 tons against 57,909 tons, so that the amount available for consumption was presumably somewhat less than the total of the figures above, and this amount was reduced somewhat more by an increase in stocks during the year, from 86,876 tons to 89,494 tons. The consumption of new zinc in 1941 was up 13% from 1940, at 827,435 tons, which corresponds rather closely with primary production.

World Production of Zinc

(In thousands of metric tons)

	1929	1937	1938	1939	1940
Australia	50.8	70.9	70.9	70.8	85.0
Belgium	197.9	225.6	210.4	185.7	65.0
Canada	78.1	143.9	155.7	161.8	180.0
France	91.6	60.4	62.2	60.3	35.0
Germany	102.0	163.3	192.5	212.3	225.0
Norway	6.4	41.3	46.5	45.0	20.0
Poland	169.0	109.3	110.8	117.9	160.0
U.S.S.R.	3.4	70.0	80.0	90.0	95.0
United States	573.0	534.9	414.6	488.3	657.0
United Kingdom.	59.2	63.1	56.2	50.4	60.0
World Total	1,472.8	1,667.9	1,589.7	1,678.1	1,732.0
Ex. U.S.	899.8	1,133.0	1,175.1	1,189.8	1,148.0

There was little information from other sources at the close of 1942. Mexico produced 154,996 metric tons of zinc in ore in 1941, but only 34,600 tons in the first quarter of 1942, falling down badly in March. The recoverable zinc content of Peruvian ores in 1941 was 23,700 tons, while mine production in Argentina was 36,300 tons. (*See* also War Production, U.S.)

(G. A. Ro.)

Zirconium.

Zircon was being recovered in Florida as a by-product of the treatment of beach sands for titanium minerals, and in California as a by-product of gold dredging, but output was not reported. Imports were increasing heavily, 20,101 short tons received in the first nine months of 1941 being 20% greater than the receipts for the full year of 1940. Australia was in 1942 the chief producer, supplying 73% of the 1941 imports; 24% came from Brazil, while India, formerly an important source, furnished only 3% of the total.

(G. A. Ro.)

Zoological Gardens.

Dr. William Beebe's 42nd expedition set out to study animals in the Venezuelan jungles. Financed by the Simon Guggenheim foundation, its headquarters were at the Standard Oil company's camp.

Dr. Myron Gordon, elected fellow of the New York Zoological society, was appointed research associate in genetics. At the San Diego zoological gardens plans were made to replenish stocks of far eastern animals by breeding. This zoological society instituted two research fellowships.

Great Britain.—After some controversy, Dr. Julian Huxley resigned his post as secretary to the Zoological Society of London and Dr. Sheffield A. Neave, director of the Imperial Bureau of Entomology, was elected honorary secretary. Dr. Neave stated that the zoo would retain its popular side, but that Whipsnade might have to be closed because of transport difficulties. Attendance at both Regent's Park and Whipsnade improved during the summer. An "off-the-ration" exhibition at the London zoo was opened by the duke of Norfolk. The first black buck of the year was born in September. The Linnean society arranged to hold meetings of zoological interest jointly with the Zoological society. Chester, Dudley and Maidstone zoos reported better attendances than in 1941, but increased absorption in war work lessened interest and they expected difficulty in carrying on. In July an orang-utan was born, of parents from Sumatra, an event probably unique in Britain. Efforts were made to hatch nine emu eggs in Dublin zoo.

The scanty news of European zoos was not concerned with animals. In Copenhagen, the acute housing shortage resulted in animal houses being fitted up for human habitation. The monkey house in Paris zoo was transformed into a prison, while Stalingrad zoo was fiercely defended by the Russians against the German onslaught. (V. R.)

Zoology.

The year 1942 saw the beginning of changes in this science due to World War II. These changes centred about (1) loss of mature investigators, teachers and students to the war effort; (2) curtailment of curriculum and research in universities and colleges, and (3) curtailment of extra-curricular activities. The latter point is well documented by two examples. The annual convention of the American Association for the Advancement of Science, originally scheduled for New York in late December, was postponed in order to relieve the nation's transportation facilities. This meant that, since there were no meetings of such research organizations as the American Society of Zoologists, the Ecological Society of America and the Entomological Society of America, there were none of the usual opportunities to report zoological studies and catalyze zoological ideas. Another index of the war's effect on zoology is the registration of investigators at the Marine Biological laboratory at Woods Hole, Mass. On July 29, 1939, this institution, long a haven for serious zoological teaching and research, had 303 investigators registered. On the same date in 1940, 1941 and 1942 the comparable figures were 297, 284 and 140. It seemed patent, and was so stated by the laboratory, that the decline of more than 50% between 1941 and 1942 was due to the war. However, zoology was reasonably productive during the year.

Books.—*Voles, Mice and Lemmings* by Charles Elton of Oxford university was a significant contribution to the population dynamics of small mammals. Elton described population cycles for a number of rodents. He concluded that the important factors causing these cycles are predator activity, epidemics and senescence. These act on the population by affecting its reproduction, mortality and dispersion. *The Vertebrate Eye and its Adaptive Radiation* by Gordon L. Walls was a comprehensive study of the optical apparatus of vertebrates from a broad biological viewpoint. This book discusses such usual topics as the anatomy, physiology and biochemistry of the eye. In addition, and perhaps its greatest contribution, is the excellent treatment of the evolution and adaptive radiation of the eye throughout the vertebrate subphylum. The point is made once again that much can be learned about a group of animals through selecting some important structure possessed by all and studying its ramifications and specializations. In 1917 Sir D'Arcy Thompson published a volume entitled *On Growth and Form* that was destined to become a biological classic. In 1942, 25 years later, this book, revised, reset and enlarged, was placed before another generation of zoologists who received it most cordially.

Research.—One of the suggestive research trends in 1942 was a renewed interest in studying phylogeny (racial history) by precipitin tests (serology). Three papers are selected for mention here. These examine the question on three different taxonomic levels: kinship between phyla; within a class, and between species of the same genus. Wilhelmi used serology in testing a theory of the origin of vertebrates. This theory, in general good repute but based largely on embryological evidence, holds that the prochordates (vertebrate ancestors) were derived from a pre-echinoderm stock (starfish, etc.) while the Arthropoda (insects, spiders, crabs, etc.) were derived from annelid worms. Interestingly enough, the precipitin tests corroborated the theory. Thus, they indicated a closer serological relationship of echinoderms with prochordates than with annelids or arthropods, and a closer affinity of annelids with arthropods than with echinoderms and prochordates. Defalco examined the serological relationships of birds. Working with twelve different forms (leghorn, plymouth rock, buff orpington chickens; guinea hens; pheasants; turkeys; geese; ducks; buzzards; pelicans; gulls, and the emu) he concluded (1) that the systematic position of Aves (birds) is confirmed by precipitin tests, and (2) that birds are serologically an essentially homogeneous group. On the species level Mahr examined the kinship between two species of tapeworm parasites, both members of the same genus (*Monezia expansa* and *Monezia benedeni*). He found the precipitin reaction so delicate that, even at this evolutionary level, the species could be differentiated one from the other. The serological method thus emerges as an important tool in tracing phylogeny. Its greatest attribute is its objectivity. It is essentially independent of the investigator's bias.

An important monograph on the migration of butterflies was published in England by Williams, Cockbill, Gibbs and Downes. This unusually comprehensive study covered the following major topics: methods of observing butterfly migration; migrations of particular species; marking butterflies; how butterflies orient during their migrations; the density of flight, and conclusions. Of most general interest perhaps is the discussion on marking. The investigators attached a small label ". . . bearing a serial identification number and a well-known address to one wing with a plainly visible coloured mark on the other wing." The address, "London Zoo," was chosen because it is well known in England. As butterflies were caught the tag number would occasionally be reported to the zoo. This method was just getting underway but eventually it should yield data as valuable for butterfly dispersal as bird-banding is for bird migrations.

As usual there were a number of excellent review papers published in zoological science. Two that were authoritative and that illustrated the scope of the field were "Production of Life in the Sea" by H. W. Harvey and "On the Development of Feathers" by Frank R. Lillie. These appeared side by side in the same journal. The former typified the approach of the ecologist necessarily interested in a broad field with many ramifications. The latter illustrated a delimited, careful analysis of embryonic differentiation. (*See* also MARINE BIOLOGY.)

(T. PK.)

Zweig, Stefan

(1881–1942), Austrian writer, was born Nov. 28 in Vienna and was educated in the Austrian capital. He wrote poetry in his youth and travelled widely in many parts of the world. A sensitive personality, Zweig underwent a profound emotional shock during World War I; he frequently decried the "lunacy of war" in his works. After the war he embarked on a serious literary career. He wrote numerous biographies and established a reputation as one of the great contemporary German writers. His works were widely translated. He fled Austria just before Hitler's legions overran his homeland in March 1938. The life of an exile was harsh on the aging Zweig. In despair over the spiritual future of Europe, and lacking the strength to carry on, he and his wife committed suicide at their home in Petropolis, Brazil, Feb. 23. One of his last works, *Amerigo: A Comedy of Errors in History*, was published the day of his death.

INDEX

The black type entries are article headings and cross references. These black type article entries do not show page notations because they are to be found in their alphabetical position in the body of the book, but they show the dates of the issues of the *Book of the Year* **in which the articles appear.** For example, **"American Iron and Steel Institute 43, 42, 41, 39"** indicates that the entry "American Iron and Steel Institute" is to be found in the *1943 Book of the Year*, the *1942 Book of the Year*, the *1941 Book of the Year* and the *1939 Book of the Year.* The reference **"Adult Education:** *see* **Education 43, 42.** *See* **Education, Adult 41, 40, 39"** indicates that the entry "Adult Education" is to be found in the article "Education" in the *1943 Book of the Year* and the *1942 Book of the Year*, and under the heading "Education, Adult" in the *1941 Book of the Year*, the *1940 Book of the Year* and the *1939 Book of the Year.* **All black type entries without dates indicate that the same entries appear in all previous issues. Examples,** not **Advertising 43, 42, 41, 40, 39,** but **Advertising;** not **Academy of Arts and Letters, American:** *see* **American Academy of Arts and Letters 43, 42, 41, 40, 39,** but **Academy of Arts and Letters, American:** *see* **American Academy of Arts and Letters.**

The light type headings which are indented under black type article headings and cross references refer to articles elsewhere in the text (of this issue only) related to the entry listed in black type. The light type headings which are not indented refer to information in the text (of this issue only) not given a special article. All the light type headings show page references.

All headings whether consisting of a single word or more are treated for the purpose of alphabetization as single complete headings. Names beginning with "Mc" and "Mac" are alphabetized as "Mac"; "St." is treated as "Saint." All references below show the exact quarter of the page by means of the letters *a*, *b*, *c*, and *d*, signifying respectively the upper and lower halves of the first column and the upper and lower halves of the second column.
